

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

Companies (Limited), registered—

Advance Motor Manufacturing Co., 752.
Anciens Etablissements Panhard-Levassor (English Patents), 1577.
Anglo-French Automobile Synd., 92.
Anglo-French Motor Co., 238.
Argyll Motors, 432.
Argylls (London), 1283.
Arrow Motor Omnibus Co., 1486.
Aster Engineering Co., 1372.
Atkey (A. R.) and Co. (1905), 580.
Austin Motor Co., 1634.
Auto Claw Co., 1004.
Automobile Cab Co., 1550.
Automobile Carre, 1035.
Automobile Corporation, 238.
Automobile Guarantee Synd., 976.
Automobile Industries, 1577.
Automobile Log Synd., 1252.
Automobile Wheel Co., 404.
Automobilia, 1605.
Auto Wheel and Tyre Co., 1004.
Baker, Fred. W., 1344.
Barnett's Motors, 1520.
Barry Motor, 1160.
Batchelor (R. G.) and Co., 334.
Bettoruss Non-Skid Tyres, 752.
Blackpool Motor Garage and General Engineering Co., 976.
Bradford Motor Car Co., 460.
Bradley Motor Patents, 270.
British Automobile Development Co., 432.
British Buffalo Marine Motor Co., 1444.
British Empire Motor Trades Alliance, 1404.
British Hele-Shaw Patent Clutch Co., 752.
British Motor Boat Club Proprietary, 62.
British Motor 'Bus Trust, 1404.
British Motor and Engineering Co., 1222.
Buckingham Gate Garage and Engineering Co., 1372.
Buckingham Gate Motor Hansom Co., 666.
B.W. (Start Cold Paraffin) Carburettor Co., 1095.
Cambridge Motor Omnibus Co., 492.
Carnarvon Motors, 1160.
Cars, 580.
Chassis, 1252.
Chenard-Walcker Motors, 1160.
Chichester and Selsey Motor Omnibus Co., 912.
Chiswick Motor Omnibus Co., 1444.
City and Suburban Motor Cab Co., 1577.
City and Suburban Motor Omnibus Co., 976.
Clarges Street Garage, 270.
Clément Motor Co., 1486.
Coates (J. C.), 1160.
Colonial Motor Transport Co., 1004.
Commercial Cars, 1194.
Commercial Press, 608.
Compensating Gearing Syndicate, 200.
Continental Tyre and Rubber Co., Great Britain, 492.
Co-operative Factors, 1577.
Cork Motor Co., 1004.
Corre Dépôt (Ltd.), 1095.
County Motor and Cycle Co., 814.
Cremorne Motors, 1404.
Cupelle Motors, 270.
Cycloid, 580.
Darracq (A.) and Co. (1905), 1486.
Dart Motor 'Bus Co., 1634.
Deal, Dover and Folkestone Motor Omnibus Co., 1634.
Deal, Walmer and District Motor Omnibus Co., 782.
De Cadigan Resilient Wheel Co., 1068.
Derbyshire Motor Omnibus Co., 580.
Direct Motor Co., 30.
Doyle (D.), 1035.
Durham and District Motor Omnibus Co., 1486.
East Berks Motor and Engineering Co., 1344.
Eastern Motor Wagon Co., 552.
East Kent and Herne Bay Motor Omnibus Co., 1194.
Electric Ignition Co., 460.
Electromobile Hiring Co., 334.
Engineering and Motor Tools (Croker-Barnes Patents), 1222.
English Motor Car Co., 62.
Etablissements Turgan, 1314.
Evans Carburettor and Motor Pump Synd., 1486.
Excelsior Motor Tyre Co., 580.
Express Motor 'Bus Co., 1605.
Farrah, Alfred J., 1283.
Fife Submarine and Engineering Co., 1577.
Finchley Motor and Engineering Co., 1095.
Fitzgerald Tyre Synd., 1404.
Flewitt, 1160.
Frank Morris, 608.
French, 814.
Garrard-Maxfield Motor Manufacturing Co., 432.
Gaulois Tyres, 1068.
General Motor 'Bus Synd., 636.
Glasgow Motor Tyre Co., 1404.
Gnome, 1444.
Gnome Motor Car Co., 1252.
Gobron-Brillie British Motor Co., 580.
Greyhound Motors, 238.
Hall's Transmission Gear Synd., 92.
Hartenfeld, Son, and Co., 1160.
Hay Motor Co., 1160.
Haywood and Co., 1035.
Herne Bay and Canterbury Motor Service Co., 492.
Hollingsdrake Automobile Co., 552.

Companies registered (contd.)—

Horn, Littlewood and Co., 1160.
Hunt (R. L.), 334.
Hutton (J. E.), 1577.
Industria Motors, 270.
Iris Cycle Co., 1194.
Irish Motor Car Co., 92, 334.
Jackson Resilient Hub Synd., 372.
Jepson (R. L.), 200.
Jonas' Wheels, 200.
J. P. Motor Co., 460.
Kensington Motor Co., 492.
King's Motor Patents, 432.
Kirsch and Co., 1577.
Kuettner, MacDonnell and Cookson, 432.
Lanarkshire Motor Omnibus Co., 782.
Lancaster Motor Association, 698.
Langdon-Davies Motor Co., 200.
Laws Stores, 1252.
Leader Motors, 1372.
Leech Tyre Co., 1520.
Leete and Co., 814.
Lenox Autocar Co., 1372.
London and District Motor 'Bus Co., 372.
London and Paris Automobile Agency, 782.
London and Parisian Motor Co., 200.
London and South Coast Motor Service, 1520.
London Motor Car Co., 238.
London Motor Omnibus Co., 92.
London Motor Transit Co., 1314.
London Power Omnibus Co., 372.
Lory's Yacht Agency, 492.
Mann and Overton (Ireland), 1605.
Mann, Egerton and Co., 372.
Marine Motor Club of Great Britain and Ireland, 636.
Martini Automobile Co., 636.
McNeil, Hutchinson and Co., 636.
Mechanical Development Syndicate, 62.
Mendelssohn (E.) and Co., 1314.
Mercury Motor 'Bus Co., 1577.
Metropolitan Motor Cab and Carriage Co., 698.
Metropolitan Motor Road Car Co., 122.
Michelin Tyre Co., 636.
Middleton Pneumatic Hub Syndicate, 782.
Mid-Sussex Motor Co., 1194.
Millennium (Ltd.), 666.
Mitcham Motor Co., 432.
Montgomery Motor Co., 814.
Morris, Frank, 608.
Motor Boat Club of Great Britain and Ireland, 666.
Motor 'Bus Advertising Co., 1035.
Motor 'Bus Co., 304, 698.
Motor Cab Construction Syndicate, 552.
Motor Cab Supply Co., 492.
Motor Car Co. (1905), 238.
Motor Cartage and Transport Co., 30.
Motor Cycle and Motor Car Accessories Co., 122.
Motor Exchange of Great Britain, 552.
Motor Omnibus and Wagon Co., 372.
Motor Omnibus Construction Co., 304.
Motor Pneumatic Tyre Co., 976.
Motor Roads, 1283.
Motor Supply Co., 608.
Motor Traction Co., 1095, 1550.
Motor Transit Trust, 976.
Motor Trust and Agency, 372.
Motor Users' Proprietary Co., 1577.

THE AUTOMOTOR JOURNAL

A RECORD AND REVIEW OF APPLIED AUTOMATIC LOCOMOTION.

Circulates amongst Makers and Users of Motor Cars, Cycles, etc., in the United Kingdom, the Colonies, and the Continent.

Offices: 44, St. Martin's Lane, London, W.C.

No. 234. (No. 26, Vol. X.)

JULY 1ST, 1905.

[Registered at the G.P.O.]
as a Newspaper.

[Weekly. Price 3d.
Post Free, 8d.]

Kaiser Wilhelm of Germany just stepping into his 70-h.p. Fiat at the St. Pauli Bridge in Hamburg, during his automobile trip from Hanover to that city.

PASSING EVENTS.

The Markyate Sentence.

At the Hertz Assizes on Monday last, Cornalbas, the driver of the motor car belonging to Mr. Hildebrand Harmsworth which knocked down and killed a child at Markyate in April last, was sentenced to six months hard labour. On the whole we are satisfied with the sentence. It is severe enough to act as a deterrent to *porcus viarum* (the road hog), and it is not so severe as to savour of malice or vindictiveness. Whether the conviction is defensible from the strictly legal and technical point of view may be an open question, and we think that one leading daily goes too far in declaring roundly that Cornalbas was *certainly* driving above the 20-mile limit. This was far from being *proved* in evidence at all, and the judge plainly said he would refrain from putting it to the jury. But that Cornalbas was morally guilty of criminal negligence in driving, most people will agree, and that was the view taken by the jury. It is the effect produced on the public mind and the automobile movement by the conviction and the sentence that chiefly matter, and there can be no doubt that both these effects are salutary. Had Cornalbas been acquitted (as he conceivably might have been) on a purely technical point, the result would have been lamentable. Large sections of the populace still hostile to automobilism would have lashed themselves into a perfect frenzy, and nearly every motor car owner in the country would more or less directly have suffered in consequence. Had the judge, on the other hand, passed what lawyers with grim facetiousness term "an exemplary sentence," but what the man in the street calls a vindictive one, the whole benefit of the jury's finding would have been sacrificed. For every car driver in the country would have felt that an automobilist could never look for justice or fair treatment, and so the deterrent effect of the prosecution would have been sacrificed practically altogether. As it happened, the case was most fortunately tried by a judge of singular impartiality and clear-sightedness. His whole conduct of the trial displayed complete absence of bias, and his summing-up was characterised by marked fairness and discrimination. Loyally accepting the finding of the jury, as under the circumstances he was bound to do, he passed what on the whole must be regarded as a light sentence, but which is just heavy enough to exercise a wisely deterrent effect on the road hooligan and the reckless driver.

An Admirable Suggestion.

IN addition to his impartiality, we desire to thank Mr. Justice Bray for the exceedingly sensible proposal put forward by him when charging the grand jury. The judge observed that in his opinion the best way to deal with all accidents in which a motor car driver was concerned would be on similar lines to those adopted by the Board of Trade in the case of railway accidents, and he might have added loss of vessels at sea. In such cases a most exhaustive (and exhausting) enquiry is carried out which generally results in ascertaining who and what was in reality to blame, and is followed, at any rate in the case of captains of ships who have displayed any negligence, with very serious consequences to themselves. Mr. Justice Bray proposes that the necessary powers should be conferred on the Local Government Board. To make the proposal complete, it would seem that the drivers' certificates should come under the control of the

Board in the same way as the certificates of masters of ships come under the control of the Board of Trade, who have power to suspend a careless navigator if they think fit. That would be much more just to the motorist than permitting his certificate to be suspended by a bench of magistrates, who are often prejudiced, and have not the machinery necessary for conducting a satisfactory enquiry. If one may judge from the terror which the prospects of a Board of Trade enquiry, and the possibility of having their certificate suspended by the Board, instil into the minds of ships' captains, a similar arrangement would go a long way to absolutely eliminate the reckless driver. The plan would certainly be of the highest value both in assisting to prevent the customary Press exaggeration with which every automobile accident is embellished, and to which the Hon. A. Stanley, in a letter we published last week, drew attention. It would also strengthen the hands of the club in dealing with the reckless driver, whose final and complete elimination is a matter of more real concern to automobilists themselves than even to the general public.

The Parks—More Bureaucratic Exclusion.

SOME of our readers may possibly have imagined that the remarks which we made in reference to the Lord Chief Justice's decision in regard to the parks question a few weeks ago savoured of exaggeration. We observed at the time that "from henceforth the parks may be regarded as places where the principles of the British constitution do not apply," and "it will be now quite legal for the Commissioner of Works to reduce the speed (of motor cars in the parks) to one mile an hour or even to exclude them altogether." But we have not had long to wait for an exemplification of the truth of these observations, and a proof that they did not savour of exaggeration in the slightest. The First Commissioner of Works (that is to say the police) have wasted very little time in making use of the Lord Chief Justice's decision. They have now decided to exclude motor cars altogether from Hyde Park during the hours of the day when it is supposed to be the particular playground of fashionables—would-be and otherwise—viz., from 4 to 7 in the afternoon, except between the Victoria and Alexandra Gates. *The Daily Telegraph* describes this period as "during society hours." "Society hours" is a delightful expression which deserves to be copyrighted, and we hope the owners of electric broughams, who are generally among the fashionable classes, will enjoy the restriction. No one can now dispute the legality of the procedure, and we hope the Lord Chief Justice, if he ever takes himself to Hyde Park "during society hours," will experience a due sense of elation in the powers which his great position has enabled him to exercise when he sees the motor broughams of his friends turned back from the park gates. Seriously, the position is a scandal. The parks are the property of the British public, and every man has a right of access to them, even if he drives a motor car, provided he drives it rationally and properly. For the people to be excluded from the enjoyment of their own property in this manner is a proceeding which everyone must feel is an anachronism in the neighbourhood of the Thames, however it might become the banks of the Neva.

NEEDLESS to say, extreme indignation, amounting one may say to positive fury and gnashing of teeth, prevails among the users of electric vehicles, who have been in the habit of very largely employing these carriages

during the fashionable Park parade. Large numbers of Members of Parliament, too, have been accustomed to drive down to the House across the Park in motor vehicles of various kinds, particularly along the drive from Lancaster Gate to the Achilles Statue, which is now prohibited, though the portion from Victoria Gate to Alexandra Gate is still open to them. But, like unto the common or garden growler, "on this stretch they must not loiter," nor must they go at more than 10 miles an hour. An up-to-date motor car proceeding at 10 miles an hour would certainly appear to everyone to be loitering in a most preposterous manner, so if the police do not secure the conviction of automobilists for exceeding the speed-limit, they will get them for loitering without any question. Under the circumstances, even the stretch between the Victoria and Alexandra Gates is therefore likely to be little used.

This touch about loitering shows the First Commissioner of Works to be possessed of humour of a high order. He now has full powers to do as he likes. There is nothing to prevent him in the supreme and unfettered exercise of his autocratic power from shutting out all other carriages from the park "during society hours," and driving round it in solitary state by himself. Should he elect to adopt this course, however, we think it would be only becoming that he should offer the Lord Chief Justice a seat beside him.

The Odium Theologicum Once More.

THE Marquis of Queensberry's pistol with which he stated his intention of defending his children and their timorous nursemaid on their daily peregrinations to and from Edith Villas, has now given place to a canon—not the piece of ordnance, be it understood, but the Church dignitary—who, on the present occasion, however, seems to be even more explosive than that weapon of the secular power with which his title coincides. Canon Greenwell is of the same way of thinking as the Marquis of Queensberry, with a slight, a subtle and altogether intangible difference. We are, of course, referring to the reverend gentleman's remarks as Chairman of the Durham County Bench, when in pronouncing judgment on a motorist arraigned before him on the usual charge, he declared that "He would not say that they should shoot them, but it would not be a bad plan if a few were shot." Theological study, we understand, has always led to nice distinctions, and we leave it to the Canon and his friends to say what the distinction is between this and a direct incitement from the judicial bench to slaughter motorists. We are quite convinced that legally there is none at all, and if some Durham or Yorkshire yokel takes it into his head to put the Canon's advice into practice, and discharge a gun with fatal effect at some passing motorist, and say that he believed in doing so he had the sanction both of the Church and the judicial bench after Canon Greenwell's remarks, we venture to think the Canon would find himself in an exceedingly hot place—sooner, perhaps, than he anticipates.

Not the Spirit of the Meek.

It is really difficult to say whether such an attitude on the part of a high functionary of the Established Church of the realm is painful or laughable. It is laughable, of course, as being such a ludicrous violation of the tenets which the Canon must be professionally presumed to hold. It is painful as an example of the extent to which

anti-automobilist fanaticism can carry a man who, presumably by associations, position, and education, belongs to the cultivated classes. The thing would have been bad enough had the Canon merely expressed his private opinion. But as an utterance from the judicial bench it is a public scandal. Apart from its aspects as an incentive to outrage (from which point of view it can be by no means merely laughed at), it, of course, leads every automobilist instantly to conclude that from the Durham Bench, with such a Chairman, nothing approaching justice can be hoped for. In other days and other times, such an utterance would have been sufficient to ensure the Lord Chancellor removing the offender's name from the Commission of the Peace. With our present Lord Chancellor it is too much, perhaps, to hope for independent initiative of this kind, but we trust another week will not elapse without our being able to chronicle that the automobilist Members in the House of Lords have drawn the Lord Chancellor's attention to the episode.

With the result of the interpellation which has, since the above was written, taken place in the House of Commons we cannot pretend to be at all satisfied. Mr. Duncan asked the Home Secretary whether the reverend Canon had made use of the language attributed to him, and elicited from Mr. Akers Douglas the reply that he had been in communication with the reverend Magistrate, and had been assured by him that he only used the language by way of a joke, and that nobody in the Court took it in any other sense. With this the Home Secretary appears to be more or less content ("though he cannot approve of such remarks being made from the Bench even in jest"), and he does not think that any further action is called for. This certainly looks as if it were Mr. Akers Douglas' view that Petty Sessions should be conducted on the principles prevailing on board H.M.S. "Irresponsible"!

The Hill-Climbing Competition Question.

THERE is no doubt that the Automobile Club is not very enthusiastic about hill-climbing competitions. We can quite understand their state of mind. Once upon a time it was possible to find hills up which the cars of that day (it seems distant now, but it was only a few years ago) could not succeed in climbing at a very alarming pace. Things are different now. Even comparatively low-priced cars can romp up most hills, over which an ordinary road goes, at a speed in excess of the legal limit. This fact puts the club in a quandary. It is the guardian of the automobile movement in the United Kingdom, and several of its leading members are prominent members of the House of Commons. It is quite obvious that it will not do for the club to go on countenancing events and competitions in which the law of the land is broken, if it desires any consideration to be paid to the little phalanx of its members in the House of Commons when automobile legislation is being discussed. Such a state of things would simply amount (metaphorically speaking) to placing a loaded blunderbuss in the hands of Mr. Wason, Mr. Soares, and all the anti-automobilists in Parliament, for them to discharge at the head of the Hon. Arthur Stanley, the Hon. John Scott-Montagu, and the other automobilist members, whenever it suited them. So we think the club would be quite right to give up countenancing this sort of competition altogether.

It is quite plain, however, that it cannot continue its present course. The results of so doing were rendered plain enough at South Harting. Here a competition was decided, cars were classed, and a cup awarded on what we are since told was a time basis only, and yet the club does not venture to publish the times. That sort of thing is no good at all. It is merely the time-honoured device of the ostrich, who, having buried his head in the sand, thought it had discovered the very latest ruse in effectually hiding its body. The "personal" element, which, it was understood by some, prevailed, *might* have saved the situation, but such a suggestion is scornfully scouted.

Hill-climbs were originally devised as a method of testing the relative powers of cars without involving high speeds on the public roads, and at that time they were by no means speed contests; but they are speed contests to all practical intents and purposes now, so we think the club would do well to discourage them plainly and straightforwardly, and to say so, especially when in any way conducted for the apparent gratification of nobody except a few *poseurs*.

• • •
What is Needed.

THE abandonment of such contests is the less to be regretted, as the experts are by no means unanimous as to what mere power to get to the top of the hill in the shortest possible time represents in car value. There are such a number of complicated considerations to be taken into account. Two at least which ought to figure in any competition that permits a powerful car costing £1,000 to compete with a small car costing £100, are price and seating capacity, both of which need to be given arbitrary values in relation to "speed." How little agreement there is amongst those who have studied the subject is shown plainly enough by the fact that the club is still engaged in getting out a hill-climbing formula, while nearly every provincial club differs in regard to the formula to which it pins its faith. The situation is much as if horse experts were asked to devise rules by which Derby winners, ordinary hunters, carriage horses, cart horses, mules, and donkeys, could all be satisfactorily run together over the same course, and their relative performances compared.

Of course, what is really wanted is something that will amount to a short reliability trial—a test which will enable provincial clubs to appraise the relative capabilities and good qualities of the cars of their members in an afternoon or at most a day. One thing only is quite clear at the present day, and that is that a hill-climb will not do it.

We are all looking forward to the Tourist Trophy to give us some valuable data as to the best methods of improving and shortening reliability trials. At any rate, there are good grounds for believing that the limitations already proposed (and likely to be further elaborated) regarding power, weight, general proportions, and seating capacity, will tend to the production of certain definite types of car which it will be possible to permit to compete together without serious injustice or anomalies. Until, however, some such standardisation becomes general, it will only weaken the position of the Automobile Club to countenance such very unsatisfactory—and almost useless—competitions as hill-climbing contests.

A Royal Lapse.

KINGS, of course, can do no wrong, and reigning monarchs are exempt from the ordinary laws designed for regulating the conduct of their subjects. In this country, however, we have become so long accustomed to this portion of the Royal prerogative being "more honoured in the breach than in the observance," that it is with something of a shock that we learn that the German Emperor, for once in a way (it must be admitted the occasion was unusual), gave way to a temporary attack of speed mania, and raced an express train across the Lüneburger Heide. Near the picturesque old town of Celle, His Majesty very nearly had a bad smash. One of the tyres of his car burst, and the car, while travelling apparently at about 60 miles an hour, very nearly took a ditch, but the driver evidently was a man of metal, and nothing happened. The Emperor merely got out and continued the run to Hamburg on another car which was following. His Majesty has uttered in times past some very sensible observations regarding speed maniacs. It is a pity to think that their value is likely to be to some extent discounted by this momentary yielding to the excitement of speed. One thing, however, may be urged in extenuation, and that is that there is very little traffic on the Lüneburger Heide, that the country is flat, and that nearly everywhere one can see the road for miles and miles, and also anything that may be approaching on cross roads.

Promising Motor Boat Developments.

THIS week we place before our readers the first instalment of an article on the subject of suction producers in connection with internal combustion engines for the propulsion of motor boats. The subject should prove an attractive one to all interested in the future of the motor boat, for, to describe the advantages of the suction producer in a short and popular way, it may be said to combine the advantages both of the steam engine and the internal combustion engine in one and the same plant. It possesses the advantages of the steam engine, because it permits of the employment of coal or coke as fuel with the resulting safety and great economy. And it possesses the advantages of the petrol engine, ease of manipulation, with consequent saving of labour, readiness of starting, and high efficiency—that is to say, considerable horse power for small weight and great compactness. That the employment of suction producers for boat propulsion has now reached an important practical stage of development, is sufficiently guaranteed by the fact that Messrs. Thornycroft, whose experience in mechanically propelled boat building is second to none, have adopted the "Capitaine" suction-producer system, and we understand intend to enter a boat provided with it for the approaching reliability trials. We are taking advantage of the particulars in regard to the "Capitaine" producer, which have been placed at our disposal, to illustrate the principles involved in apparatus of this class, and at the same time to provide a popular article on the subject. One of the features of the apparatus which may, at first, possibly perplex the less technical of our readers, is the fact that the gas is actually produced in close contact with the mass of red-hot fuel, and is led away from it (to be employed as fuel in the cylinders of the engine) without being burnt. The furnace is, in fact, located in the heart of the gas producer.

GORDON-BENNETT RACE.—Map of the Auvergne Circuit, reproduced from the coloured map issued by Messrs. Michelin and Co. The course and features of the country are clearly shown in this map. We recently published this, but now reproduce it, so that our readers may more readily be able to follow the race taking place next Wednesday.

THE GORDON-BENNETT RACE,

WEDNESDAY, JULY 5TH.

ROUTES TO THE COURSE.

REGULATIONS for reaching the course at Laschamps from Clermont have been officially issued as follows. In the accompanying map, which we have specially prepared, the directions can be easily followed:—

Motor Cars and Motor Cycles (for the south side of the course).—Follow the National road, No. 89, from Clermont to Theix, passing Place Gambetta, Beaumont, Ceyrat. At Theix the road to St. Genest de Campanelle (*chemin d'interet commun* No. 82) must be followed, and after leaving this place Laschamps is reached, *via* Pardon and Beaune. For the north side of the course, the road to Chamliers (*chemin d'interet commun* No. 68) must be followed, cars then proceeding to Royat, Fontanas, La Font-de-l'Arbre, and crossing under the course by the passage near Enval.

Horse vehicles and cycles may only travel by one route, viz., the old Royat road, leaving Clermont by the *chemin d'interet commun* No. 5, which passes along the Boulevard Pasteur and the Chemin de la Poudriere. Royat railway station will also be passed, as will Ma Campagne, Bargoin Park, and Gravenoire. Vehicles then take *chemin d'interet commun* No. 21, leading to Charade, Manson, and Laschamps.

After the race, vehicles will return by the same respective routes at a speed not exceeding 7½ m.p.h. (12 kiloms.). This limit will be rigorously enforced.

Controls.

Official controls will be established in similar manner to the French Eliminating Trials, as follows, they will be of two classes:—Speed limit controls (indicated by blue flags) and stopping controls (indicated by yellow flags). At certain of the stopping controls the cars will be re-spaced by a 3m. interval, at the others they will be allowed to proceed immediately.

Speed-limit Controls (maximum speed 25 m.p.h. = 40 kiloms.):—

- (1) Quatre Routes near Nebouzat.
- (2) Entering Massagettes.
- (3) Turning at Bourg Lastic.
- (4) Crossing at Lastic.
- (5) Crossing at Sauvagnat.
- (6) Crossing at Bromont Lamothe.
- (7) At Saint Ours.
- (8) At Clermont Ferrand cross roads.

The acute turn on leaving Rochefort, which is said to be the worst turning on the whole of the Course. The cars ascend, coming in on the left of the picture.

The twisting road beyond Pontamur.

Bird's-eye view of the double turning at Champradet.

The double turning at Le Grand Tournant.

A FEW OF THE BAD TURNINGS. AUVERGNE CIRCUIT.

Stop and Start Controls:—

(1) Entering Rochefort.

Stopping Controls where Cars will be Re-spaced with Intervals of 3 minutes:—

(1) Entering Laqueille.

(2) At Pongibaud crossing.

Notes in Brief.

The start will take place at 6 a.m. on the 5th of July from the plain of Laschamps (point kilometrique 5.15 route grand communication No. 16).

Cars will be started at Laschamps at intervals of either three or five minutes.

The route will be closed to traffic from half-past four in the morning until six o'clock, and the time allowance for the race is until five o'clock in the evening.

The end of the race will be made known by the passage of cars decorated with tricolour flags, after which the public may make use of the course.

A speed limit of $7\frac{1}{2}$ miles per hour (12 kiloms.) is imposed on all vehicles returning after the race.

THE question has not yet been definitely settled whether the French Club have decided finally to take part in the Gordon-Bennett race in 1906 or not. In any case, it will probably be announced prior to the race next week what their decision is, so that whether they win or lose, their motives cannot be in any way questioned.

SOME rather striking details are published in Paris in connection with the withdrawal of the Dufaux cars on behalf of Switzerland. As originally reported by us, the withdrawal is due to the Swiss Club having called upon the Dufaux Brothers to pay the whole of the expenses required by the French Club as the proportion of the Swiss Club towards the organisation of the race. Messrs. Dufaux, not unnaturally, could not see eye to eye with the club in this respect, having paid originally the entrance fee demanded of them, and made formal entry in consequence, and taken on the heavy expense of building the necessary machines.

From the details now published of this episode, it would further appear that although the share of the expenses of the organisation asked of the Swiss Club by the French Club amounts, as agreed at the International Conference held in Paris last December, to a sum of 25,000 francs, the Swiss Club have called upon the Dufaux Brothers to pay them 50,000 francs. As a bare statement, on the face of it, this appears to be curious, but possibly some explanation may be forthcoming from the Swiss Club in regard to the matter.

GORDON-BENNETT RACE.—Two of the British team on the Auvergne course. The Hon. C. S. Rolls (driving) with Hands, his mechanician, by his side, and in the tonneau of the Wolseley Car is Mr. Bianchi on the right, and his mechanician, Wilde.

GORDON-BENNETT RACE.—Plan showing the positions of the grand stand, weigh-bridge, &c., at the starting point at Laschamps on the Auvergne Circuit.

GORDON-BENNETT RACE.—One of the three Fiat Cars which will represent Italy on Wednesday next in the Race, Lancia, who drove a similar racer at Homburg last year, finishing 7th, is seated in the car with his mechanic, who will accompany him. The Fiat Racers have four cylinder engines, developing 100-h.p.

GORDON-BENNETT RACE.—The two other Italian drivers who are to compete on behalf of their country in the Gordon-Bennett Race next week, viz., Nazzari and Cagno, with their mechanicians, who will accompany them respectively round the Auvergne Circuit. Cagno is the Queen of Italy's driver, and is well known in Continental motor racing circles.

GORDON-BENNETT RACE.—Map showing the roads officially set apart for visitors wishing to witness the race from the starting point at Laschamps. The roads are clearly indicated which are reserved (1) for motor cars and motor cycles, and (2) for horse-drawn vehicles and ordinary cycles, travelling between Clermont Ferrand and Laschamps, to reach either side of the course.

THE 1905 DE DIETRICH CARS.—PART I.

A 24-h.p. De Dietrich Car, with side entrance body.

So enviable a reputation has already been earned by the De Dietrich Company in this country, as well as on the Continent, that it is almost unnecessary for us to do more than remind our readers that the cars made by this firm stand in the very front rank of up-to-date pleasure vehicles. It is not surprising that the De Dietrich cars should be remarkably fine examples of engineering construction, considering that the works in which they are manufactured afford exceptionally favourable facilities for the purpose, for the De Dietrich Company is an old established firm of railway coach and wagon builders, and their enormous factory at Luneville is equipped with all the necessary up-to-date appliances to enable every portion of a complete car to be constructed upon the premises. In spite of the large size of their existing works, however, the success which has attended their automobile business has been such that they are not only greatly extending their factory, but are sparing no

expense in the further development of this new branch of their business.

We have already given—in connection with the last Paris Salon and on other occasions—some of the leading particulars of the standard models which the Company are turning out this year, but, hitherto, it has been impossible for us to include a fully illustrated and complete description amongst our “cars and systems,” and only recently have Messrs. Jarrott and Letts—the English agents—had a spare chassis to place at our disposal for the purpose. Now, however, we have made a close study—and have obtained a very complete set of photographs—of the 24-h.p. chassis, and are therefore in a position to deal with the 1905 models in an adequate manner.

As will be seen from what follows, the new models—of which there are four distinct types—differ very considerably from those of last year. The chassis are now

Fig. 1.—View of the 24-h.p. De Dietrich Chassis from the “off” side.

Fig. 2.—View of the 24-h.p. De Dietrich Chassis, as seen from above.

built so that they are not only much longer but are also lower. They are, in all cases, of the chain-driven type, and now have ball-bearings fitted throughout the entire transmission-gear, and in the road-wheels.

The same simple and neat appearance has been retained in the design, although the accessibility of each part has been greatly improved, and an increased efficiency of transmission has been obtained by eliminating all lateral strains on the mechanism. At first sight, perhaps, an impression is produced that the new engine is more complicated than that on previous models, but this in reality is far from being the case, and closer investigation tends to show that its improved characteristics have been obtained without sacrificing its reliability or the accessibility of any of its component parts. The workmanship throughout the car is, if possible, of an even higher grade of excellence than previously, and it is evident that the De Dietrich Company have kept fully in touch with recent developments in the metallurgical world, for the materials employed by them are second to none. Each of the four models is constructed with frames of three different lengths to suit various types of body, and the general design

of all four chassis—the 16-h.p., 24-h.p., 40-h.p., and 60-h.p.—is identical, except that no half-compression device is fitted to the smallest.

Special Features.

The leading respects in which these latest cars differ from previous De Dietrich practice, and from the vehicles of other makers, are as follows:—The engine is not only of a distinct design—with mechanical inlet-valves so arranged above the cylinder-heads that they are readily accessible, although operated from the same shaft as the exhaust-valves—but the method employed for controlling it is unusual. It has no automatic governor of any kind, and its speed and power are regulated by the driver. Not only is there a throttle-lever above the steering wheel, but the clutch pedal is arranged in such a way that it tends to close the throttle-valve when the clutch is disengaged. Superior, however, both to the hand-control, and to the action of the clutch pedal, is a foot-operated accelerator, by which the engine-speed can at any time be increased. The ignition system is of the low-tension magneto type, and this is arranged in such a way that the armature of the

Fig. 3.—View of the 24-h.p. De Dietrich Chassis, from the rear.

magneto is "advanced" or "retarded" simultaneously with "timing" the igniters. In connection with the engine, attention should also be drawn to the half-compression device that renders even the 60-h.p. engine easy to start.

but it is now designed in such a way that the inner member can be quite easily removed, and a new leather face could, if necessary, be substituted without dismantling any other portion of the mechanism. Similar accessibility has been secured for the change-speed-gear, for not only is the gear-box so made that it can be partially or completely removed, but it is connected with the ends of the countershaft, and with the clutch, by universal joints which have the additional advantage of preventing any strain from being imposed on the shafts, however much the main frame may twist.

The brakes are also specially noticeable by virtue of the ease with which they can be adjusted, and of their substantial and simple construction, while the steering gear is—from many points of view—remarkable, partly because the lever-arm does not overhang as is usually the case, and partly because provision is made for taking up all wear.

Leading Dimensions.

As already mentioned, each of the four models is made in three different lengths. The 16-h.p. chassis has a wheel-base of 9 ft.,

Fig. 4.—The 24-h.p. Engine fixed in place on the De Dietrich Chassis (left side), showing the exhaust-valves and inspection-covers, the inlet-valve, operating-mechanisms, the half-compression device, and the pressure valve.

Quite a new form of carburettor has been adopted this year, and this has been designed in such a way that the spray-jet and the needle-valve in the float-feed-chamber are both easily removable. An approximately constant richness of mixture is maintained by opening auxiliary-air ports at the same time that the throttle-valve is opened, and a very effective spraying effect is obtained by allowing the two currents of air (the main air and the auxiliary air) to impinge against one another above the jet.

In order to overcome the disadvantages of feeding the petrol from the fuel-tank to the carburettor under pressure, and in order to enable the engine to be started (or to continue running) while the tank is being refilled, a small auxiliary tank is placed on the dashboard, and this is normally kept full by the main supply. Even when no pressure is available, the petrol can flow by gravity from the auxiliary tank, and thus the large tank can be made to form an actual part of the chassis, without any attending inconveniences; the De Dietrich chassis are quite complete in themselves, nothing being fixed to the body.

The main clutch is of the ordinary leather-faced cone type and is controlled, as before, by a stationary spring;

Fig. 5.—View, from the right side, of the 24-h.p. Engine fixed in place on the De Dietrich Chassis, showing the igniters, with their rotary switches, the carburettor, and the magneto.

of 9 ft. 8 in., or of 10 ft. 4 in.; the 24-h.p. chassis, which is that from which our photographs were taken, has a wheel-base of 9 ft. 2 in., of 9 ft. 10 in., or of 10 ft. 6 in.; the 40-h.p. vehicle has a wheel-base of 9 ft. 4 in., of 10 ft., or of 10 ft. 8 in.; and the wheel-base of the 60-h.p. model is 9 ft. 7 in., 10 ft. 3 in., or 10 ft. 11 in.

The engines all have four cylinders, and the only real difference between them—except for the absence of the half-compression device on the 16-h.p. type—is in their size. The bore and stroke of the 16-h.p. are 104 and 120 mm. respectively; of the 24-h.p., they are 120 and 120 mm. respectively; of the 40-h.p. they are 130 and 140 mm. respectively; and the bore and stroke of the 60-h.p. engine are 150 and 170 mm. respectively.

The cars sold in England have 870 by 90 mm. tyres on the front wheels, and 920 by 120 mm. on the back wheels.

Our Illustrations.

Apart from those of complete vehicles, which show some of the types of body that can be fitted to suit individual requirements, our illustrations are specially selected with a view of enabling the construction of the chassis, and all its chief parts, to be seen at a glance, while—following our usual practice—one system of reference letters has been employed throughout, and a table is appended by which each can be identified. Three views of the complete chassis are given in Figs. 1, 2, and 3, and these, taken in conjunction with one another, will be found to render clear the position of each portion of the mechanism, while in Figs. 4 and 5 are obtained two views of the engine fixed in place in the chassis, with all connections made, but with the dashboard removed.

The engine itself is shown separately, from each side and from each end, in Figs. 6, 7, 8, and 9, and a further

view—from above—is given in Fig. 11. Some of its more important parts, dismantled, are illustrated in Figs. 10 and 13, the former showing a cylinder casting with the inlet-valves lifted out for inspection, and Fig. 13 showing the two portions of the crank-chamber, as well as the crank-shaft with its pistons.

In Fig. 12 are two views of a low-tension igniter, and in Fig. 14 is shown the dashboard with its fittings in place. The carburettor is seen from two different points of view in Fig. 15, and its internal construction is rendered clear in Fig. 16. Fig. 17 is intended primarily to demonstrate the accessibility of the clutch-cone; the photographs not only show the construction of that mechanism, but also give excellent views of the parts that connect the clutch and accelerator pedals with the throttle-valve.

In Figs. 18, 19, and 20, the change-speed-gear, the foot-operated brake on the countershaft, and the compensating mechanism for the hub-brakes are well in evidence, the first showing the open gear-box from above, the second giving two views of the countershaft, and the third being a view of the front and central portions of the chassis is seen from above.

In Fig. 21 a good view of the interior of one of the expanding hub-brakes is obtained, and Figs. 22 and 23 refer to the steering gear; this is shown complete with the steering pillar and the wheel in Fig. 22, and the gear itself is seen dismantled in our final illustration.

(To be continued.)

Another Beck Case in parvo.—We feel compelled, in the public interest, to draw attention to an example of miscarriage of justice, coupled with an almost unparalleled exhibition of insolent arrogance on the part of the police official mainly concerned in it. A Mr. J. W. Hoyle, of Brighthouse, was on May 17th last fined £5 and costs, with a month's imprisonment in default of payment, for driving a motor car in Shipley without a rear light. The evidence was that of two policemen, who maintained that the car in question bore the number AK 58. Mr. Hoyle declared that the car with this number had not been out for three months and was out of repair, evidence which was confirmed by a motor engineer of the name of Harold Flather. Notwithstanding this, Hoyle was convicted. It has since been announced by the solicitor of Mr. Illingworth, a Bradford magistrate, whose car bore the number AK 56 (a number that evidently was mistaken for AK 58), that Mr. Illingworth actually drove through the district in question on the very night in question, and that his rear light frequently went out. It is, therefore, quite clear that a miscarriage of justice has taken place, though the evidence establishing Mr. Hoyle's innocence did not come to hand till too late for him to appeal to Quarter Sessions, and as a point of law is not involved, he cannot appeal to the Divisional Court. One would have thought that under such circumstances both the magistrates and the prosecuting police superintendent would have jumped at the opportunity of doing the correct thing gracefully, and have been as pleasant as possible about it. Nothing of the kind! Crawshaw, the Superintendent of the Police, had the gratuitous

insolence to state publicly in the Court, though he was not giving evidence, facts of a private nature calculated to be seriously detrimental and annoying to Mr. Hoyle, who, it must be remembered, all the time is an innocent man wrongfully convicted, and one whom this police official, as a public servant, ought to have been most anxious to see justice done to. Under such circumstances, the absurdity of Crawshaw having previously attempted to suggest, as he did, till promptly stopped by the solicitor for Mr. Hoyle, what Mr. Illingworth would have done "had he been a gentleman," was a little too preposterous. This serious miscarriage of justice, coupled with this painful exhibition of police insolence, is a useful reminder that the spirit which led to the Beck scandal is still rampant among undesirable members of the police.

ONE of the daily papers has indulged in a short biography of Lord Windsor, the First Commissioner of Works, whose arbitrary action in excluding motors from the parks "during society hours" has attracted so much attention and given rise to so much indignation. Our daily contemporary attributes the First Commissioner's action, in spite of his actually being an automobilist himself, to nervousness, and this nervousness in turn to the fact that in early youth the nose of the noble lord was broken, or, at any rate, seriously damaged by a cricket ball. A more laughable *non sequitur* we have seldom heard of. Why, if because your nose has been broken by a cricket ball in early youth, you should in late middle age become nervous of motor cars, is a psychological mystery of the first magnitude.

MARINE GAS ENGINES.

THE "CAPITAINE" SUCTION-PRODUCER.

INCREASED safety and reduced cost of fuel have been the principal considerations which have led to attempts being made to find a suitable substitute for the petrol engine, and hitherto this substitute has been chiefly looked for in the development of the heavy oil internal-combustion engine. With the development of the motor boat, these matters have increased in importance—particularly from the commercial point of view—and they have lately been the cause of renewed activity in the application of the gas engine to a class of work which has, hitherto, been almost exclusively performed by the steam engine. It is, of course, chiefly from its commercial aspect that the marine gas engine derives its claim to the careful attention which it is more and more closely receiving as time goes on, and is just now receiving to a very greatly increased extent in several influential quarters.

its producer, and the petrol engine with its carburettor, yet the characteristics of the fuel used (coal) do not lend themselves to anything like the same simple treatment as do those of petrol.

Coal Gas and Producer Gas.

Gas engines have, of course, been in use on land for many years, and originally their fuel was coal-gas, obtained directly from the town mains. Coal-gas, however, is primarily an illuminant, and is rendered more expensive than it otherwise need be in order to make it specially suitable for lighting purposes. But gas engines run equally well on the cheaper fuel—producer-gas—which is also obtained from coal, and has for several years now been used for power purposes. When coal is converted into coal-gas there remains behind, as coke, at least 60 per cent. of the original weight of the fuel, but when coal

Fig. 1.—The Capitaine Launch fitted with a Capitaine marine motor and suction producer.

"Producer" versus "Carburettor."

With the problem of the heavy oil engine, motorists generally are to some extent familiar, and our readers have been kept well informed concerning such progress as has from time to time been made in this direction. The gas engine, however, is a thing apart—involving as it does the employment of a very different type of apparatus to the carburettor—and it has but comparatively recently claimed their attention as a possible, and by no means unlikely, prime mover for motor boats. The difference between an ordinary gas engine and an oil engine is, in reality, a difference in class rather than in kind. The carburettor of the latter makes its gaseous "mixture" as required by the engine, the action being essentially a hand-to-mouth process, and it is only the readiness with which petrol may be turned into gas, and the fact that no residue of any kind is left behind in the fuel tank, that enables the operation to be carried out so quickly and by means of so simple and diminutive an apparatus. Most gas engines, however, draw their supplies from gas which has been stored in a reservoir for the purpose, and although, as we shall see presently, the latest developments in this direction have evolved a striking similarity in action between the gas engine with

is converted into producer-gas nothing need be left except a small percentage of ash. The economy of the producer-gas over coal-gas is, therefore, obvious.

For the benefit of those who have not realised the difference that there is between coal-gas and producer-gas, or who are unfamiliar with the actual processes by which they are alternatively obtained, we think the following instances, in which both kinds of gases are given off from an ordinary household fireplace, will serve to bring the matter home to even the least technical reader. Any combustible material when raised to a high temperature in air becomes wholly or partially converted into gas. In an ordinary fireplace, where coal is burnt, the blaze is the result of igniting the stream of gas which is driven out of the upper layers by the heat of the incandescent fuel beneath—this gas is coal-gas. If, however, coke is employed, no such yellow flame is ever visible, but, instead of this, there often is a bluish non-luminous flame that takes its place. In this case the gas is emitted from the incandescent layers themselves, and this gas is producer-gas. In either case the flame merely results from the ignition of the gas, which, if not ignited, would pass up the chimney unburned.

(To be continued.)

THE USE OF THE HIGHWAYS.

THURSDAY evening, June 22nd, was the occasion of a very interesting discussion on this subject. It took place at the Hotel Cecil, and was held subsequent to one of the Society of Motor Manufacturers and Traders' dinners. Mr. Henry Sturme, who opened the discussion, spoke chiefly about the personal use of the highways and the inconsiderate driving question. Opposition, said Mr. Sturme, was mainly attributable to ignorance of the driver's control over his vehicle. This ignorance was not altogether confined to the lay public, and he deplored the practice of rich novices making their first essays with high-powered cars on our main highways. Motorists were not the only offenders by any means, and Mr. Sturme very justly instanced the excuse so frequently given and accepted in the case of horse accidents, "Oh, it's a young horse." Young horses, said the speaker, should not be allowed on our main roads in charge of ordinary individuals until they are thoroughly broken in. Among other remarks made in Mr. Sturme's very sensible and open-minded speech, was one to the effect that the horn was provided for the purpose of giving audible warning of approach, and that the rather increasing practice of omitting its sufficient use was much to be deprecated. Cutting corners on the wrong side of the road was another objectionable practice of some tourists, who evidently think that the science of a Gordon-Bennett race might be profitably applied in all circumstances. Mr. Sturme's remarks about pedestrians, were not eulogistic of that body as a class, and his humorous remark that they should carry head and tail lights was not without its serious side.

The Hon. A. Stanley, who followed Mr. Sturme in the discussion, spoke of his recent observations in the House of Commons, and testified to the better feeling which now seemed to prevail amongst *anti*-automobilists. Even Mr. Cathcart Wason, who has some fame in this respect, and was to have been present at the dinner, had expressed himself in his letter of apology as not being antagonistic to motorists generally—but only to a small and objectionable class. The effect of the Act, said Mr. Stanley, was spoiled by the speed limit, if this were eliminated the penalties under the "common danger" clause might even be increased without prejudice to motorists as road users.

Major Lindsay Lloyd, in opening his remarks, confessed that the title chosen for the subject of the discussion had not conveyed to him so much the idea of considerate driving on roads, as of the uses for which roads were, and more particularly were about to be, employed, and that the real question at issue was what is the *nature* of our roads. Personal considerations, said Major Lloyd, will undoubtedly adjust themselves in time, but unless there is a decided move in the direction of ensuring our highways being capable of carrying the traffic which will unquestionably be put upon them in the near future, there will be a deadlock. Bridges, for instance, were a particular bugbear, it was all too common to find bridge notices containing a clause to the effect that the bridge was only safe for loads not exceeding those "customary in the neighbourhood." Long distance through traffic, and not local traffic, was the real purpose for which our highways were built, and it was absurd that the authorities should be allowed to obstruct the through routes in our kingdom in this manner.

Mr. Bennett Stanford made a very sensible suggestion, which, if followed up by those to whom it applies, would do much towards creating a better feeling on the part of those to whom the "dust nuisance" is a particular grievance. This suggestion—which Mr. Bennett Stanford has already expressed before one County Council, of which he is a member—is to the effect that the local authorities should expend some part of the money accruing from licensing in the oiling of the main roads in the immediate vicinity of such isolated dwelling houses as were more particularly affected by the dust raised by passing cars. Another point, touched on by other speakers also, which Mr. Bennett Stanford raised, was the necessity for a central authority for the control of our main roads, and while speaking on this subject, he suggested that even toll gates—every hundred miles or so—might be tolerated, if they were found necessary as a source of revenue.

Mr. S. F. Edge said that he considered that it was the sudden appearance of a car which caused more annoyance to other users of the road than mere speed. People were not afraid of a car, nor of its speed, but if they were startled by its sudden appearance in the first instance, then they were sure to be subsequently annoyed at its comparatively rapid rate of progression. Mr. Edge also suggested that all road users ought to be subjected to a stiff examination of their capabilities for using the roads properly.

Mr. Rees Jeffreys was among the speakers to touch upon the national importance of a central control for our highways, and of the importance of adapting our roads to our traffic and not our traffic to our roads. In this connection, he instanced the behaviour

of the Board of Trade when dealing with railway accidents, and that of the average coroner's jury when dealing with motor-car accidents—both caused, for example, by an imperfection in the route. The former body request that the permanent way be made safe for the speed attained, and the latter that the speed of the vehicle be restricted until the speed becomes safe for the road as it is constructed.

Mr. G. S. Gawley's remarks were mainly concerned with the necessity for good foundations to roads, and he made the interesting observation—based on figures obtained from an authority in a position to express an opinion—that the main highways could probably be reconstructed to suit future motor traffic at a cost equivalent to 10 years' capitalised value of the present upkeep expenditure—the subsequent upkeep being, of course, far less than that now obtaining.

Mr. F. Coleman, Mr. W. G. Williams, and Mr. Hills also took part in the discussion.

In the absence of the President, the chair was occupied by Mr. H. G. Burford.

INDUSTRIAL ALCOHOL.

(Concluded from page 777.)

DR. ORMANDY, in reply, said: The Chairman (Mr. S. Straker) seemed to apprehend that the use of a compression amounting to 8 or 10 atmospheres would lead to difficulty in starting. If it were necessary to start an engine under this compression, difficulties would certainly be introduced, but, fortunately, it is easily possible to arrange matters in such a way that the engine is started under a partial compression.

A point of great value in favour of alcohol, which has not, I think, been referred to before, was made by your Chairman, when referring to the state of the law with regard to the introduction of petrol-driven engines into or about the dockyards. As mechanically propelled vehicles become more and more generally employed, this obligation will tell very heavily against them in such cities as London, Liverpool, Glasgow, and the like.

With regard to the question of denaturing, there is no substance yet discovered so efficient as wood spirit. The point which requires to be raised in this connection, is whether the Government would not be sufficiently safeguarded if only half the present amount of wood spirit were used, together with the addition of a small quantity of crude benzene or solvent naphtha, together with the addition of enough methyl violet to colour the spirit. Dr. Thorne pointed out that when benzol had been added to an alcohol it was possible to separate the benzol by the addition of water, and that the benzol, thus separated, actually removed some of the evil-smelling compounds present in the wood spirit, which was a Government safeguard. In what way this is to be considered as a particular disadvantage is hard to see, since it is open to anyone to buy a small quantity of benzol, which can be added to the methylated spirit as made at present, before additional water is added. In other words, if benzol can be used to purify methylated spirits, so as to render it drinkable, it will not make much difference whether the benzol is present to begin with, or has to be obtained. The class of people likely to systematically defraud the Government are not likely to be put off by the difficulty in obtaining a common product like benzol.

Continuing, Dr. Ormandy said that the Hon. John Scott-Montagu, M.P., spoke hopefully about alcohol as a fuel. His remark, that so long as potatoes were used as a valuable food in Ireland there was little chance that potatoes would be used for alcohol making, is rather wide of the mark. It was never suggested that edible potatoes, or rather potatoes grown specifically for edible purposes, should be converted into alcohol. The suggestion made has been that more land should be put under cultivation, and more employment for labour found by growing more potatoes and converting these into alcohol, which is indeed a very different case. To listen to Mr. Scott-Montagu's remarks would lead one to think that every yard in England and Ireland capable of being put under cultivation for potatoes was at present so occupied. Unfortunately, this is very far from being the case. He spoke of land being more highly cultivated in this country than in Germany, which is hardly correct, and statistics go far to show that more and more land in this country is continuously going out of cultivation, and being converted into permanent pasture. Then again, the speaker kept making comparisons between the cost of methylated spirit as it is, with petrol as it is. The object of the meeting to-night is rather to pave the way for a substitute when petrol advances in price—a state of affairs which the near future is likely to experience. The time-worn argument that motor cars do not run on alcohol in Germany and France was brought up by Mr. Scott-Montagu, and a number of other speakers. Possibly the fact that these speakers are not connected with the technical and commercial side of the motor

trade, may account for their non-appreciation of the reply which has been put forward in answer to this argument. Statistics show us that no less than three-quarters of the cars made in France are sold outside the country, and the same applies in equally high degree to Germany. Is it then likely that these manufacturers will build cars specially designed for a fuel which is only obtainable in their own country, and which, even there, is not so easily and so generally obtainable as the more usual paraffin product? So long as alcohol is only used in one or two countries, so long will it not pay large makers to lay themselves out for special models designed to work therewith.

In all probability the speakers who refer to the smell of the exhaust of alcohol engines have never had experience with an engine running on approximately pure denatured alcohol, for the simple reason that the motor car engine designed for use with this substance has not yet been made, and in order to be able to use alcohol in the existing engines, it has to be mixed with a large percentage of benzol. The exhaust from engines using the mixture certainly smells worse than from the engines using petrol. This is another case of arguing from false premises. The solution of the difficulty proposed by a speaker is one which does not answer some of the chief points which to-night's paper was intended to bring forward. The use of a heavier spirit, though it would increase the amount available for motor purposes, would still leave the supply in foreign hands, and would still leave the market open to manipulation.

The remarks of the next speaker, Mr. Tyrer, certainly led us to think that it would be possible to arrange conditions such as would enable us to have alcohol made within our own shores at a price very much less than now obtained. The satisfactory importance of this subject was that, on the whole, it confirmed my concluding statement—that the Government were prepared to consider any reasonable case for further alteration in the law presented to them by the motor manufacturers.

Col. Holden, said Dr. Ormandy, confirmed the idea that petrol was regarded as more dangerous than dynamite, but seemed to think that the heavier oil engine would finally displace the petrol engine. As the difficulties in the way of using heavy oil are of the same nature, but immensely greater than those accompanying the use of alcohol, it would seem that the only question as between the two was one of price. Once more it must be pointed out that the solution offered does not solve the question as to the necessity for an indigenous or colonial supply.

In conclusion, one may say that the difficulties which have been raised are by no means to be considered insuperable, and that the arguments in favour of looking out for some fuel other than petrol have been very convincing. The only suggestions offered were in the direction of using what one might call the continuation products beyond petrol, and as the use of this leaves us in the same position as before with regard to many of the points raised in objection to petrol, it would seem that the case in favour of the formation of a committee to examine more fully and completely into the question of fuels has been well made out.

Sir David Salomons (communicated):—My general impression is that most speakers lost the point of the question of "home-produced fuel," and discussed the alcohol question from other standpoints. Also, I saw that the whole matter was what Americans call "too previous," namely, assistance is asked from the Government before a satisfactory engine is forthcoming. I do not think so despairingly of alcohol engines as certain other speakers, and would also point out that the experiments made in France are delusive, since benzine is mixed with the alcohol. Nothing was said on the beetroot spirit produced by sugar making, which could be had for a nominal price in France, but the Government refused all help. I am told this by people interested in the matter in France.

It appears to me the proper method to pursue is the following:—To have an international competition of alcohol engines, say, in two or three years' time, with substantial prizes, and announce the matter now, that inventors may start on the work. I would suggest two first prizes, of not less than £1,000 each. That a committee of four or six experts be formed to draw up the conditions; amongst the following should be a *sine qua non*: (1) Engines for road carriages. (2) To be of no greater weight or size power for motor power than the best petrol engine of to-day. (3) That the starting, running, attention, &c., shall be as easy and convenient as to-day with best petrol motors.

I suggest that one prize be for an alcohol engine of its own special type. The other prize for the best modification of the present form of petrol engine to use alcohol (the object of this is to avoid throwing out of use thousands of engines in the event of petrol supply running short).

The prize should only be given for the complete solution and not merely for the best engine presented to the judges. If this question is solved, then the great impetus which must follow in the alcohol trade will enable the Government to give facilities without loss of

revenue. If you think such a move is desirable, I think all Automobile Associations should join in a prize fund, namely, yours, the Club, Motor Boat Clubs, &c., &c., and I should naturally be willing to become a subscriber.

Mr. W. J. Malden (communicated):—The statement of the Chancellor of the Exchequer, that the average price of potatoes to the Irish farmer is £2 per ton, seems to have been accepted as being conclusive that there is no possibility of Irish potatoes being made use of. Had he said that no potatoes could be bought in Ireland under £2 per ton, there might have been some good reason why this reading should be accepted. But surely, where the average price of sound potatoes is only £2, it must be certain that a large proportion fall below that sum. For my own part I am quite certain that the whole growth of Irish potatoes does not bring home a clear £2 per ton. I cannot but think that there is a very wrong idea as to the price at which potatoes, well suited to the making of alcohol, are obtainable, as within the last few months I have had to leave potatoes in the clump, because the demand for those too rough for culinary purposes, though of high starch-yielding properties, has been so small that they would not pay to send away. I could not help feeling that I would have liked to have the Chancellor of the Exchequer or Mr. Scott-Montagu as prospective purchasers—not at £2 per ton, but even at the lowly 5s.—I have in my experience practically thrown away hundreds of tons, all good stuff to make alcohol; every year there is a vast quantity of rough stuff practically wasted.

The United Kingdom grows something like 1,200,000 acres of potatoes. In most years there is a considerable amount of disease—not necessarily disease which reduces the potato to a pulp at once, but which renders it unfit for culinary purposes, though little affecting its use for making alcohol. As stock food, potatoes have not a big value, especially as, if fed to horses, cattle, &c., in free quantities, they are highly poisonous. In fact, I have had horses and cattle poisoned by them. I am confident that two tons per acre does not on an average cover the waste in potato growing, and this gives approximately 2½ million tons which sell at £1 per ton or under, or which are wastefully fed to animals, or are allowed to rot. Surely these would not be too dear as a source of alcohol were Excise difficulties alleviated and denaturing adopted. As Germany gets over the difficulty by denaturing, why should we not have equal ingenuity?

The members of your society will generally agree that motors are to replace horses. Ireland is essentially a horse-rearing country. The staple crops of Ireland are grass, oats, straw and roots—all of which are largely grown to support horses in Ireland and out of it; I leave out potatoes for the moment. What crops can anyone suggest which can keep the land in cultivation in Ireland as the horses give way to the motor? Canada is relatively near at hand to send over oats and hay, which it must do in fast increasing quantity now that the land is being so rapidly brought under the plough. What is the future of Ireland unless some help is given to it to develop its potato growing?

Near Dublin, Belfast, Cork, Waterford and a few other places, potato growing is carried on in a highly skilful manner, and potatoes of a high quality are raised. The growers have large populations at hand, moreover they export a good many. These, I quite believe, average £2 per ton and considerably more. But there are only eleven towns in Ireland with a population of 10,000 people, apart from these the people are rural or semi-rural. Yet some 600,000 acres or more are grown yearly. The better quality goes to the town or for export. The bulk of the potatoes are of low culinary quality, apart from those in the districts mentioned, and, when exported to England, fetch low prices. The main portion of the crop is consumed at home, where certainly they have not a value of £2 per ton.

The price of pork in Ireland does not allow a high price for the potatoes from which it is raised; eggs and poultry show little return on the prices paid, and milk, even under the advantages of organisation, fetches only 3½d. per gallon with the skim back. How can anyone make the return on potatoes above £1 per ton when such conditions prevail? Taking out the top price of the specially good ones, those sold to towns or for export have heavy charges for carriage, commission, sacks, extra labour in sorting, &c., which makes the price at home very different from that at market. In Ireland, England, and Scotland, it is not, however, a matter of average that needs to be dealt with industrially, it is the big low stratum of indifferent crops for which a market is specially needed, and for which £1 per ton would be gladly accepted. These run into millions of tons every year.

Of course everything does not rest with automobiles. There are many other industries which could be greatly advanced were Excise difficulties removed. Automobilists are, however, an organised body with the ear of Parliament; and are associated, directly or indirectly, with other industries which they could influence, and might lead the way.

FERRY OR BRIDGE.

LITTLEHAMPTON AND THE PROPOSED NEW BRIDGE.—Map showing the great convenience which the new bridge will be for general traffic. The new scheme will open up the level flat road from Brighton to Bognor, &c., instead of cars and other traffic having to travel round the hilly district viâ Arundel, or be subjected to a tedious wait and awkward ferrying across as at present.

THE proposed new bridge over the Arun at Littlehampton has already been the subject of some discussion in our columns, and, as our readers will call to mind, the result of the attention that we have been instrumental in concentrating upon the subject has resulted in an amendment of the Bill empowering it to be built, which will involve the elimination of a ridiculous old clause which *could* have been interpreted to the great disadvantage of automobile goods transport. A glance at the map and at the photograph which we reproduce, will show that it is particularly for the transport of goods that the new bridge will be of the greatest value. Two roads run along that part of the Sussex coast where the downs, retreating from the sea, leave a tongue of some of the richest alluvial soil in England. One of these, from Brighton to Chichester, runs over spurs of the downs through Clapham Woods and Arundel. It is the more picturesque and in some ways the better road of the two, and from time immemorial its surface has been of the best. The lower coast road is shown by a thicker black line on the map, and winds about considerably. It has the great merit, however, of extreme flatness, and from this point of view is specially suited to goods transport, though, of course, the sea-road has its charms too, and there are many occasions on which automobilists desire to use it. Hitherto it has been rendered relatively impracticable by the gap formed by the River Arun at the point indicated by a black circle. This gap has hitherto been negotiated by a ferry designed to

take a few carts across at a time, and worked by a chain and winch. This is, of course, quite inadequate to cope with the traffic which the lower road is capable of accommodating, and Littlehampton is accordingly promoting a Bill to enable a regular bridge to be built here, and tolls to be taken until the debt on it is paid off. Chichester is still a more considerable port than many people are aware of, and the benefit to Littlehampton, and the villages and towns lying to the east of it, should prove considerable, as, to many of these, the present detour through Arundel renders heavy goods transport by road impracticable.

LITTLEHAMPTON FERRY AND THE PROPOSED NEW BRIDGE.—A view of the existing hand-operated "chain-bridge"—i.e., ferry—which necessitates vexatious delay, either in waiting for the "operators," or in making the long detour and climb round by Arundel. The pleasant level road along the coast line would be rendered available to all traffic by the new bridge.

MOTOR FISHING SMACKS—THE RETURN OF NAPIER MAJOR.

Mr. Hearman. Skipper Evans. The Crew.

Skipper Evans, his amateur Mate, Mr. W. Hearman, and his "crew," who have just returned with Napier Major after their long coasting trip.

Napier Major putting into Westminster on Saturday after her memorable voyage.

NAPIER MAJOR'S RETURN.

ALL the motoring world, and especially that part of it whose pleasure or occupation takes a nautical turn, has been interested in the remarkable voyage of this 45-ft. cruiser, which the fertile mind of Mr. S. F. Edge conceived, and the energy of "Captain" Evans accomplished. Since April 20th—when the crew of four received a hearty send-off from Temple Pier—until Saturday last, when they all returned safe and sound to the same place, Napier Major has been making her voyage up and down the coast, a voyage of breezy incidents—well told by her captain in a letter which we published some time ago*—which was protracted beyond all ordinary running time by the fulfilment of one of the objects of the cruise.

It was not only to demonstrate to the world that a properly-built motor boat, such as, for instance, our British engineers and boatbuilders know how to construct, would prove a seaworthy cruiser—a supposition which the mere voyage of the boat itself has shown to be beyond all doubt—but it was also, and it was by no means incidentally also, the project of Mr. Edge to gain first-hand information as to the needs of our fishermen along the coast. With this end in view Napier Major put in at over thirty ports on her return journey—the outward trip being of the nature of a non-stop run—and Mr. A. F. Evans instituted enquiries relating to the requirements of our fishing fleets with regard to self-propelled fishing smacks.

At three of the ports of call, meetings were held for the discussion of the subject, and here, as elsewhere, Mr. Evans was able to glean valuable information which will be immediately acted upon by his firm (S. F. Edge and Co.), for whom Messrs. Napier and Son will build a special type of engine at their newly-acquired works near Thames Ditton. Concerning the actual facts and figures relating to motor fishing smacks, Mr. Evans had,

when we met him immediately upon his return, much interesting matter to relate. The fishing interests are, says Mr. Evans, in the hands of a shrewd, hard-headed, but withal, keen body of men, and although he could but show them a yacht fitted with a yacht's motor, yet what that boat had done was sufficient for them, and they turned out to look at it—not as sightseers, but as business men. What they saw convinced them of the suitability of motor propulsion for their smacks. These smacks are, it appears, all more or less of a kind, and run to about 60 or 70 feet in length, having about 22 feet beam. Their speed would have to be $8\frac{1}{2}$ to 9 knots in order to enable them to compete with steam drifters and get their catch into port from a distant ground while it was fresh.

The daily work of such a boat is not continuous. It will steam out to the fishing ground, which may be miles away. Arrived there, it will either shoot the nets under power or, if the wind is right, the engine will not be wanted for this operation. If it is used, however, it will have to run very slowly, because laying the nets is not a full-speed job. There will then be several hours to wait before the nets will be hauled up and the homeward journey commenced.

An engine for such a boat, considers Mr. Evans, should be about 80-h.p., for it must be capable of doing all the work necessary—the smack owners refusing to countenance anything in the nature of an "auxiliary" engine. The plant—which must, of course, consume paraffin as fuel—would probably be berthed in the cabin which is situated aft under the deck, and the whole machinery, which would include a good reversing gear, must obviously be made very substantial indeed. Existing craft would, of course, be adapted to suit the engines.

Altogether, then, it looks as if there is a well-defined field for this work, and Mr. Evans is to be congratulated on the success of his trip, no less than is Mr. Edge on his

(* See AUTOMOTOR JOURNAL, May 20th, 1905.)

pioneer enterprise, on behalf of the entire industry, in organising it. As to the boat on which it was carried out, Napier Major, she has returned in perfect condition, and the engine is running even better than when it started to pile up that eleven million revolutions which a mathematical mind has attributed to its share of the

work. The cruise which extended over about ten weeks has covered a distance of about 2,125 miles, and consumed 450 gallons of petrol. No repairs were necessary *en route* or afterwards, and the only replacements consisted of four ignition plugs and an exhaust valve, even the latter being more expedient than necessary.

MOTOR BOATING.

Motor Yacht Club né Marine Motor Club.—The Motor Yacht Club is the new title selected by the Marine Motor Club in consequence of the registration at Somerset House of the latter title, which took place just at the time of the formation of the new club. The secretary is Mr. Wm. Morris, who was assistant secretary for 10½ years to the Kildare Street Club, Dublin.

The ten vacancies on the club committee, Mr. Lionel de Rothschild having been appointed hon. treasurer, have been filled as follows: The Hon. J. Scott-Montagu, Messrs. Sidney Tebbutt, Lorne Currie, T. Thornycroft, E. A. Whitehead, E. H. Hamilton, F. P. Armstrong, S. F. Edge, G. Foster Pedley, and R. Denys Dundas. At a joint meeting of the racing committees of the club and the British Motor Boat Club, steps have been taken to promote the best interests of the sport by arranging the dates of the events of the two clubs so as not to clash. By this means a joint programme has been made up by which a series of races will be held in the neighbourhood of the Solent from August 7th to 12th. In addition, there will be races at Sea View on August 1st, the reliability trials on August 2nd and 3rd, and two races in connection with the Royal Victoria Yacht Club on August 15th. The Windermere Regatta proposition has been abandoned, and the prize money which has been subscribed for this event will swell the funds for the Solent Week.

Reliability Trials.—Mr. J. H. S. Phillips has entered a 42-foot cruiser with a paraffin engine in Class 7, making the fourth boat in this class, all of which are over 45 feet. Messrs. Perman and Co. have also entered in the same class a 40-foot with a paraffin engine and two 30-foot boats in Class 4. Messrs. De Dion Bouton have entered two boats in Class 3. The total number of entries is 35. We regret, however, to have to record that Messrs. J. W. Brooke and Co. find it impossible to enter Baby II. owing to the accident to her, which we recorded the week before last, whilst the firm are so crowded up with work that it is impossible for them to get another boat ready in time.

The following is a full list of entries, comprising 35 in all, five of which will use paraffin as fuel, one steam, and one producer gas, the rest employing petrol:—

Class 1.—Yachts' dinghies (clench), max. length 15 ft.

No entries.

Class 2.—Yachts' launches (clench or carvel), max. length 20 ft.

Thornycroft (1), Ashton and Kilner, paraffin (1), Grove, Gutteridge and Co. (1).

Class 3.—Yachts' launches (clench or carvel), max. length 25 ft.

Simpson Strickland (1), A. G. Sentiman (1), De Dion (1), J. W. Stocks (1), Mitcham Motor Company (1), P. C. Crossley (1), Vosper and Co., paraffin (1), Thornycroft (1), Stirling (1).

Class 4.—Yachts' launches (clench or carvel), max. length 30 ft.

Maudslay Motor Company (1), J. M. Gorham (1), Stewart Foster (1), Simpson Strickland, steam (1), Perman and Co. (2), Lieut. H. G. Vereker (1), Wolseley Company (1), Thornycroft (1), Rolls and Co. (1), Lord Royston (1), Parsons Motor Company (1), E. A. Chard (1).

Class 5.—Unrestricted vessels not exceeding 25 ft. in length.

No entries.

Class 6.—Unrestricted vessels exceeding 25 ft. in length.

Lord Howard de Walden (1), Capt. R. T. Dixon (1), J. Percy Dean (1).

Class 7.—Sea-going motor yachts with permanent cabins.

S. F. Edge (1), Woodnutt, paraffin (1), J. H. S. Phillips, paraffin (1), Perman and Co., paraffin, (1), Thornycroft, paraffin (1), Producer Gas (1), Kensington Motor Boat Company (1).

Classes 1 to 4 inclusive are subject to restrictions of beam and freeboard under the M.M.A. rules.

British Motor Boat Club.—At Burnham-on-Crouch, on Saturday last, a programme of three events had been arranged by the club. The main attraction, however, had necessarily to be abandoned as, of the racing boats expected, only Mr. A. Lee Guinness' Mercedes IV., which secured the Calais-Dover Race, was in evidence. The 150-h.p. 12-cylinder engine of the Defender broke down on the way round to Burnham, whilst Javelin, the other high-powered boat, engined by Blake and built by Hart, Herden and Co., did not arrive in time. The event for boats over 20 feet up to 35 feet was secured by Mr. George Neill's "Z," which just saved her time from Mr. W. Mail Green's Takumono, the British boat which took part in the Dover-Calais Race and also was in strong evidence at Monaco. The Takumono, later on in the afternoon, won the handicap. Mrs. Walker Munro has presented to the British Motor Boat Club a valuable Challenge Cup, which will be raced for in the Solent on August 7th, on the occasion of the visit of the French Fleet to this country, and the cup has been appropriately named by the donor the "Entente Cordiale" Cup. The cup will be allotted to an event for Racing Boats not exceeding 40 ft., built or owned in England or France. No time allowance will be given, and the competitor winning the cup twice in succession, or three times in all, wins the cup outright. Other races will be given on Saturday, the classes catered for being boats not exceeding 30 ft. over all, M.M.A. restriction, rating and time scale, for a 15 guinea Cup, presented by Mr. E. Owers; boats not exceeding 25 ft. over all, M.M.A. restriction, rating and time scale, and a handicap for *bonâ fide* cruisers. In addition to the cups, over £65 will be given in prizes.

Aix les-Bains Motor Boat Races.—In connection with the Aix-les-Bains Motor Meeting, a series of events on Lake Bourget took place on Sunday and Tuesday last. On the first day in the racing section, La Rapiere distinguished itself by covering 93.6 kiloms. in 2h. 21m. 38s. (= to 39.63 k.p.h.). In the cruiser class, "Forces-Pas" in Class 3 (8 to 12 metres), made the best time of the day over 86.8 kiloms., viz., 2h. 32m. = 32.11 k.p.h. On the second day the mile and kilometre speed races were arranged for the motor boats, and the contest for the Coupe Quinones de Leon was also on the programme.

Boulogne-Folkestone.—Entries are beginning to mount up for this important race, taking place on July 15th. Six racers were entered up to the end of last week, including Napier II., thirteen cruisers including Napier and Hutton II., and four fishing boats.

At the Kiel Regatta Motor Races, which were on the

programme this week, Lord Howard de Walden's Napier racing launch was, in the unavoidable absence of the owner, arranged to be steered by Mr. Arthur Macdonald, Mr. J. Pugh acting as engineer. Napier II., which is at present at Messrs. Yarrow's works undergoing certain alterations and tests, it was found impossible to get ready in time for this meeting.

⊗ ⊗ ⊗ ⊗

RACES, RECORDS, AND TRIALS.

Webb Jay on the White steamer, which made such splendid time.

C. Basle driving H. L. Bowden's 90-h.p. Mercedes.

RACING ON THE NEW AUTOMOBILE TRACK, MORRIS PARK, NEW YORK—THE INAUGURAL MEETING.

Welbeck Races.—The winners at this meeting, of which we gave particulars last week, are officially announced as follows:—

Scratch Events, Gold Medal.—E. M. C. Instone.

Speed Judging, Gold Medal.—R. M. Wright.

Speed Judging open to Visitors.—1st prize, W. F. Hutchinson, Mansfield; 2nd, G. Hutchinson, Mansfield.

The following is a list of cars with particulars of time and the nearest guesses in the Speed Judging Competition:—

Name	Car.	Actual m.p.h.	Guess.
Instone, E. M. C. ...	30-h.p. Daimler ...	62.2	46.0
Hardy, C. ...	35-h.p. „ ...	55.5	45.0
Bolton, F. A. ...	30-h.p. „ ...	49.3	37.5
Hutchinson, W. M. ...	30-h.p. „ ...	44.0	42.0
Prestwich ...	30-h.p. „ ...	43.5	44.5
Blaimires ...	29-h.p. Rischard ...	49.3	43.0
Pullinger, T. C. ...	16-h.p. Humber ...	43.5	39.5
Hardy, E. ...	14-h.p. Minerva ...	39.1	38.0
Arnott, E. H. ...	14-h.p. „ ...	39.9	32.0
Johnson, C. ...	15-h.p. Orleans ...	38.7	35.25
Jolliffe, T. A. ...	16-h.p. De Dietrich ...	31.3	27.0
McCraith, M. ...	14-h.p. Leader ...	30.5	28.0
Hogarth, Dr. ...	10-h.p. Peugeot ...	30.8	33.0
Wright, R. M. ...	8-h.p. Wolseley ...	30.5	30.0

Louis Chevrolet on the 90-h.p. Fiat, on which he made the mile record.

Barney Oldfield on the sharp-nosed Green Dragon.

The Brighton Race Meeting.—A preliminary announcement of the rules and classes have now been issued by the A.C.G.B.I. in connection with this important racing fixture, taking place from July 19 to 22. We publish these overleaf, and it will be noticed that there are a very large number of scratch events for cars of similar types. These are lettered from A to Z and AA to WW, and embrace most of the best known types of vehicles of which there are any considerable number in this country. The element of skill in driving must, therefore, enter largely into these contests, and it will be interesting to watch the different methods adopted by the various amateurs, who it is hoped will bring forward their cars to take part in the racing. Entries close on July 13th, and it is notified that no car which has competed in a competition for racing cars in the years 1903, 1904, or 1905 is eligible for the tourist events. Cars carrying a manufacturer's or dealer's general identification mark will not be allowed to compete. In the tourist events no actual times, it has been decided, will be published, which of course must necessarily detract from the general interest of the meeting, but this drawback will be partially remedied by the announcement of an order of merit, which will be given with numerical values.

BRIGHTON RACE PROGRAMME.

Tourist and Auto Cycle Handicap. Entrance fee 5s. Machines not exceeding 80 mm. by 80 mm., or the equivalent volume swept out.

Racing Auto Cycle Scratch Race. Entrance fee 10s. Machines not exceeding 110 lbs. in weight.

Tourist Events.

The distance to be covered will be about one mile. There will be no race unless there are six entries in each event, and there will be no second prize unless there are four starters.

Scratch Races

For standard cars of the following types. The club will be prepared to consider events for other standard makes of cars, provided sufficient entries be received by 6 p.m. on Thursday, 13th July. These races will be held on July 19th and 21st:—

Event.	Entrance Fee £1.	Event.	Entrance Fee £2 2s.
	h.p.		h.p.
A	*6 De Dion.	Z	12-16 Peugeot.
B	*6 Oldsmobile.	A A	12-16 Spyker.
C	*6 Peugeot.	B B	14 Renault.
D	*6 Wolseley and Siddeley	C C	15 Darracq.
E	*7 Panhard.	D D	15 Panhard.
F	*7 2-cylinder Star.	E E	15 Star.
G	*7½ 2-cylinder Humber.	F F	15-18 Napier.
H	M.M.C.	G G	16 Fiat.
I	8 Renault.	H H	16 Martini and Rochet-Schneider.
K	*8 Rover.	I I	18 C.G.V.
L	*8½ Cadillac.	K K	18 Siddeley.
	Entrance Fee £1 10s.	L L	20 Dennis.
M	9 Darracq.	M M	24 De Dietrich.
N	9-11 Clement.	N N	24 Germain.
O	10 Duryea.	O O	24 Thornycroft.
P	10 Lanchester.	P P	28 Daimler.
R	10 Panhard.	R R	30 Daimler.
S	10 Wolseley.	S S	30 Renault.
T	10-12 2-cylinder Argyll.		STEAM CARS.
U	10-12 B.A.C.S.		Entrance Fee £1 10s.
V	12 Arrol-Johnston.	T T	6 Serpollet.
W	12 De Dion.	U U	10 Turner-Miesse.
X	12 Napier.	V V	10 White.
Y	12 Siddeley.	W W	15 White.

* These cars must carry two passengers, and all others in the list four passengers.

Event and Fee.

- A 2, £1.—Cars the list price of which does not exceed £200 (two passengers).
 B 2, £1 10s.—Cars over £200 and not more than £350. Cars listed at not more than £250 must carry two passengers, and those listed at more than £250 must carry four passengers.
 C 2, £2.—Cars with chassis costing from over £300 to £400 (four passengers).
 D 2, £2.—Cars with chassis costing from over £400 to £500 (four passengers).
 E 2, £2 10s.—Cars with chassis costing from over £500 to £600 (four passengers).
 F 2, £2 10s.—Cars with chassis costing from over £600 to £700 (four passengers).
 G 2, £2 10s.—Cars with chassis costing from over £700 to £800 (four passengers).
 H 2, £2 10s.—Cars with chassis costing from over £800 to £900 (four passengers).

Racing Events.

There will be no race unless there are three entries, and there will be no second prize unless there are three starters.

I 2. £5.—Scratch race from a standing start over a measured mile for cars weighing not more than 1,000 kilogs. (19 cwt. 2 qr. 20 lb.). The car doing the best average time for three runs will be adjudged the winner.

K 2. £5.—Scratch race with a flying start over a measured mile for cars weighing not more than 1,000 kilogs. The car doing the best average time for three runs will be adjudged the winner.

L 2. £5.—Handicap Sweepstake of £5 each for racing cars weighing not more than 1,000 kilogs., which have run in any of the racing events, the winner to receive 75 per cent. and the second 25 per cent.

Tourist Car Handicaps.

M 2. £1.—Handicap Sweepstake of £1 each for cars which have run in any of the events (A to W W). The winner to receive 75 per cent., and the second 25 per cent.

N 2. £1.—Handicap Sweepstake of £1 each for cars which have run in any of the events A 2 to H 2.

Daily Mail 100-Guinea Challenge Cup. Entrance fee, £5.—Scratch race with a flying start over a kilometre for cars weighing not more than 1,000 kilogs., irrespective of motive power. Unless the kilometre is covered under 40 secs. the Cup will not be awarded. Each car will be allowed three attempts. Present holder: Baron de Forest.

Autocar Challenge Cup. Entrance fee, £5.—For cars of any power or weight propelled by any form of motive power. If there are not three starters the Cup will not be awarded unless the kilometre is covered in not more than 40 secs. Each car will be allowed three attempts. Present holder: Baron de Forest.

The events A—W W will be run on the 19th and 21st of July.

The events under price classification A 2—H 2 will be run on the 20th and 22nd July.

The racing events will be run each day.

The handicap events will be run on the 22nd July, and will be based on the times made at this meeting.

Blackpool Race Meeting.—The provisional programme for the Blackpool Meeting, taking place on July 27th and 28th, is to hand, entries for which close on July 20th. No car which has taken part in a competition for racing cars in the years 1903, 1904, or 1905 will be eligible to compete in events A, B, D, E, G.

The Blackpool Corporation will give £100 in addition to the prizes offered, for the highest speed over 95 miles per hour, which will be increased to £250, provided a world's record for the flying kilometre be made. The present world's record is 21½ secs.

The following are the events:—

Thursday, 27th July.**Scratch Events.**

Event A. Fee £3 3s.—Cars in racing trim. Chassis price £1,000 to £1,250. Course about 1½ miles, standing start.

Event B. Fee £3 3s.—Cars in racing trim. Chassis price £1,250 to £1,500. Course about 1½ miles, standing start.

Event C. Fee £5 5s.—Race (flying start) over a measured mile, for cars weighing not more than 1,000 kilogs. (19 cwt. 2 qr. 20 lb.). The car doing the best average time for three runs will be adjudged the winner.

Friday, 28th July.

Over the flying kilometre for cars in racing trim.

Event D. Fee £3 3s.—Chassis price £1,000 to £1,250. The car doing the best average time for three runs will be adjudged the winner.

Event E. Fee £3 3s.—Chassis price £1,250 to £1,500. The car doing the best average time for three runs will be adjudged the winner.

Event F. Fee £5 5s.—For cars weighing not more than 1,000 kilogs. (19 cwt. 2 qr. 20 lb.). The car doing the best time will be adjudged the winner. Each car will have three runs.

Event G (Lancashire Handicap). Fee £1.—Handicap race over 1½ miles for cars owned by members of the following clubs:—Liverpool Self-Propelled Traffic Association, Blackpool A.C., Manchester A.C., East Lancashire A.C. Entrants must have been members of their club prior to June 15th, 1905, and likewise have owned the car entered, prior to that date. This event may be run on either or both days at the discretion of the club.

It has been decided by the Blackpool Town Council that the races are to be held on the outer promenade instead of on the carriage-way, where they were run off last October. Under this arrangement the carriage-way will be available for vehicular traffic along the front as usual, in similar manner to the arrangements at Nice, although in the case of Blackpool the racing roadway is considerably wider.

The Club Competition Rules.—The reception of the competition rules of the club by the affiliated clubs in respect to "closed" competitions has been so adverse, that wiser councils have, we are glad to announce, prevailed at the Automobile Club, judging by the resolutions which were passed at the Club Races Committee last week. It was determined that the competition rules should be suspended from application to closed competitions pending revision, all the clubs being notified that the A.C.G.B.I. relies upon them to see that no persons who have been suspended or barred from competitions under the rules of the A.C.G.B.I. be admitted to any closed competitions held by the clubs respectively. The rules are to be immediately reconsidered so far as closed competitions are concerned, and it is proposed to get out a set of model regulations forthwith, the officials of the various local clubs being invited to a conference to consider the draft when ready.

Tourist Trophy Race.—Entries now amount to fifty-eight. The latest cars entered are a Mors by Mr. Louis Carle, a Vinot and Dequingand by Mr. C. H. Wigan, and two Arrol-Johnston cars by Mr. John S. Napier.

THE Padley Wood Hill-climb of the Sheffield A.C. takes place to-day, Saturday.

GORDON-BENNETT RACE.

Apparently, it was a very peculiar accident that delayed Mr. Stead on his Richard-Brasier car in the French Eliminating Trials, and one which was indirectly caused by the injury he sustained in one of the big races last year. Even while practising recently, he found that the seat hurt his back—doubtless as a result of the mishap to which we have referred—and in order to make himself more comfortable, he therefore tied his umbrella coat into a bundle and used this as a cushion on the morning of the race. Unfortunately, his improvised cushion was jolted out when the car was travelling extremely fast, and it got entangled in one of the side-chains, wedging itself tightly in between the chain and the sprocket, badly bending the latter. A delay of about an hour was caused in straightening out the sprocket, and in spite of this Mr. Stead came in twelfth.

American Motor Record.—Last Sunday, it is cabled from New York, Mr. Guy Vaughan, on a 40 h.-p. Decauville car, established a new world's record at Long Island, for 1,000 miles continuous running. He covered this distance in 23h. 33m. 20s., beating Wridgeway's previous record, on a Peerless, of 35h. 50m. 1s. Vaughan in the 24 hours covered 1,015½ miles; Continental tyres were employed.

Aix-les-Bains Motor Meeting.—The great feature of the Aix-les-Bains motor meeting was the tourist car trial, which extended over three days, six journeys being made during this period, one in the morning and one in the afternoon each day. The meeting was mainly organised under the auspices of the Rhone A.C., and out of 39 entries, 29 cars actually started, including Baron Henri de Rothschild, on his 60-h.p. Mercedes. The distance for each stage varied from 146 to 180

kiloms. The cars were classed by cylinder capacity, ranging from 2½ to 7½ litres, subject to a maximum weight for each class. On the first day, June 20th, the downpour of rain was so fearful that the morning run had to be postponed, and the cars made their first start in the afternoon, when the sun had become more gracious. Most of the itineraries traversed during the 1,000-kilom. run were a severe strain upon the cars and the brakes.

On the second day the two runs took place in brilliant weather. Twenty-six started in the morning, of which twenty-four arrived, and in the afternoon twenty-four started and arrived back at Aix-les-Bains, the De Dion team, with Cormier leading, doing excellently throughout. On the third day glorious weather was again experienced. During this day's run M. Desgeorges, on his Darracq, attempted to take a corner down a steep mountain road too sharply, with the result that he experienced the now fashionable method of having an accident by skidding over a precipice, and landing himself and passengers in the branches of some friendly trees.

The trial included two special mountain climbs, viz., the Col de Plainpalais (14 kiloms.) and the Col du Frene (6 kiloms.), the results being arrived at by taking weight and cylinder capacity into consideration in conjunction with the speed attained. The tyres almost throughout had to undergo the most terrible strains, but with very few exceptions they came out with flying colours, the Continentals, Michelins, and Dunlops about equally distinguishing themselves in proportion to their numbers.

BARON DE ROTHSCHILD has notified the Rhone Club that for next year's Aix-les-Bains events he will present the two cups which he originally gave for competition at Nice, the first being reserved for the Tourist Trial and the second for the Hill-climbing Test.

Herkomer Cup.—Entries for this event, it is announced, now total up to 73—a very fine record. In this list the following countries are represented:—Germany, 47; France, 9; Belgium, 8; Great Britain, 5; Switzerland, 3; Austria, 1. The cup, it will be remembered, is for tourist cars over a three days' journey of 900 kiloms., two speed tests, and a hill-climbing trial, starting on August 12th, the cars being on exhibition at Munich the day before.

Paris Breslau.—For 1906, *L'Auto* announces the organisation of a Tourist Car Competition between Paris and Breslau, in which all entered cars will be carefully controlled from first to last under the method adopted in France of checking by maximum and minimum times at frequent intervals. The idea has emanated from Baron Klock, Secretary of the Silesian A.C., of which province Breslau is the capital. As the event will be an international one, and the distance about 1,500 kiloms., no doubt a good entry list will be forthcoming.

THE competition for electric vehicles from Paris to Deauville, *via* Saint Germain, Mantes, Evreux, and Lisieux, has been definitely fixed to take place on August 10th and 11th.

CLUBS AND ASSOCIATIONS.

MOSELEY HOSPITAL MOTOR GYMKHANA.—1. Balancing: Mr. A. E. Crowdy manipulating his 8-h.p. Wolseley car. 2. Mr. H. Hemmings balancing his 12-h.p. Lanchester. 3. The Coach-house Race. One of the lady competitors takes a 6-h.p. Wolseley car successfully through the test. 4. Ladies' Passenger Race between a Lanchester and a Wolseley car.

Motor Gymkhana.—Saturday afternoon, June 24th, was the occasion of a large motor gymkhana which was held in aid of the funds of the Moseley Hall Convalescent Hospital for Children. The proceedings took place in the grounds of the hospital, and were witnessed by nearly 3,000 persons, all of whom evinced a lively interest in the events. There were sixteen competitors altogether, most of whom were members of the Midland A.C. The following are the results of the various events:—

Starting and Stopping Test.—1st, A. J. W. Millership, 6-h.p. Wolseley; 2nd, G. H. Lanchester, 12-h.p. Lanchester.

Balancing Test.—1st, H. Patterson, 7-h.p. Swift; 2nd, H. J. Bourne, 7-h.p. Bourne.

Ladies' Passenger Race.—1st, A. E. Crowdy, 8-h.p. Wolseley; 2nd, G. Lanchester, 12-h.p. Lanchester.

Coach House Race.—1st, G. Lanchester, 12-h.p. Lanchester; 2nd, Miss Larkins, 6-h.p. Wolseley.

Mr. I. H. Ryland acted as judge; Messrs. Cedric P. Type and W. T. Stokes as stewards; and Messrs. A. G. Johnson, M. C. Blewitt, and Arthur Cox as timekeepers.

Blackheath A.C.—A very enjoyable afternoon was spent by about forty members and friends at Knockholt on Saturday last, when a cricket match was played against Mr. Warmesley's eleven, resulting in a close finish, the Blackheath Automobile Club losing by only 10 runs.

The Club's hill-climb, at Ightham, takes place on July 8th.

Eastern Counties A.C.—The club held its first gymkhana at the Portman Road Recreation Ground, Ipswich, on June 21st. The weather was delightful, and a large and appreciative number of spectators were kept interested and amused for upwards of four hours. Lord Russell acted as judge.

Excellent prizes were awarded, presented by Mrs. Godolphin Milbank, of Shelton Lodge, Ipswich. The band of the Suffolk Royal Garrison Artillery played a bright selection of music at intervals, tea being served during the afternoon. There were eight events on the cards, among them:—

Glass of water race, won by Dr. Moseley (6 h.-p. de Dion).
Tortoise race, won by Mr. H. W. Bloomfield (10 h.-p. Boyer).
Musical cars, won by Mr. J. R. Egerton (8 h.-p. de Dion).
Vegetable race, won by Mr. J. R. Egerton (8 h.-p. de Dion).
Turk's head and pig sticking competition, won by Mr. W. P. Burton (18-h.p. Chenard Walcker).

Race for challenge cup, presented by Messrs. Botwood and Egerton, won by Mr. Snowdon with his 16 h.-p. Argyll.

Victoria Cross race, won by Mr. J. R. Egerton (8 h.-p. de Dion).

East Surrey A.C.—The July meeting and run of the club takes place on the afternoon of July 8th to Woodhurst, Crawley, Sussex, by the invitation of Capt. R. H. Rawson and Lady Beatrice Rawson, the club being specially invited to meet the members of the Ladies' A.C.

Herefordshire A.C.—On June 24th the club met the South Wales A.C. at Pontywall Hall by the invitation of Capt. Hughes Morgan, who entertained the party of about 200 to a sumptuous lunch. The day was gloriously fine, and about forty cars, besides bicycles, turned up.

Ladies' A.C.—On Saturday last nearly sixty members of the club and their friends, on about twenty cars, visited Mrs. Gerard Leigh—one of the vice-presidents—at her country home, Kidbrooke Park, Forest Row, Sussex.

The day was ideal for motoring, as the journey over the thirty-seven miles between London and Forest Row was made under cloudy skies, while the gardens and grounds of Kidbrooke were seen at their best beneath the rays of an afternoon sun.

Unfortunately five of the members were caught in a police trap near East Grinstead, but no other "accidents" *en route* were reported.

Among those present were:—Evelyn Lady Alington, Miss Antrobus, Mr. and Mrs. Foyster Bowen, Mr. and Mrs. Buttemer, Mr. and Mrs. Campbell, the Hon. Mrs. Corbet, Muriel Countess

De La Warr, Mr. and Mrs. Elliot (of Holme Park), Miss Joicey, Mrs. Henry Edmunds, Miss Edmunds, Mr. and Mrs. Copland, Miss Home, Mr. and Mrs. Hartung, Mrs. Guy Hardy, Mrs. Herbert Lloyd, Mr. and Mrs. Manville, Mrs. Bertram Meeking, Mrs. Pigott, Mrs. Todd Newcomb, Mrs. Thrupp, Miss Parke, Miss Evans, Captain and Lady Beatrice Rawson, Miss Stubbs, and Miss d'Esterre-Hughes (the secretary).

Members of the club are reminded that the L.A.C. gymkhana takes place at Ranelagh to-day (Saturday).

The next club run will be on the 8th July to Woodhurst, Crawley, Sussex, the home of Lady Beatrice Rawson, not, as previously announced to Charlwood Park, Surrey.

Lincolnshire A.C.—At the invitation of Mr. C. A. Moreing, of Gate Burton Hall, Gainsborough, 186 members of the club and friends visited him on Saturday last, travelling from all parts of the country on about 60 cars, about 200 guests sitting down to the sumptuous luncheon provided by their host.

Motor Union.—The inter-club meet of the Motor Union at Harrogate, on Saturday last, proved eminently successful. The local organisation had been admirably carried out by the Yorkshire A.C., and the whole programme was concluded without a hitch. A committee meeting was held first at the G.N. Railway Hotel, Leeds, at which more than twenty clubs were represented. One of the principal resolutions referred to the appointment of a Highways Committee, whose object will be to co-operate with local authorities in the prevention of improper use of the highways.

This committee includes the Hon. A. Stanley, M.P., Mr. Ballin Hinde, Mr. G. T. Langridge, Capt. J. A. Cole, Mr. Charles Hardy.

It was also resolved to make arrangements at a London hotel for a special tariff to members and garage accommodation for provincial visitors. At the subsequent lunch, Mr. Stanley spoke on the inconsiderate driving question, and said "that the best way of dealing with the inconsiderate driver, and driving him off the road altogether, will be by means of local clubs."

In the afternoon about thirty cars ran over to Harrogate, and the members attended a reception held by the Mayor at the Kursaal. Later on other cars arrived, and in the end there were nearly 200 cars present. Mr. E. H. Hepper (chairman of the Yorkshire A.C.) presided at a dinner in the evening, which was attended by about 120 persons, including many ladies. In proposing the toast of the Motor Union, the chairman referred to the fact that they had a membership of nearly 8,000, and were the largest automobile organizations in the world.

Scottish A.C.—The annual general meeting of the club was held in Edinburgh last week, when Professor Dawson Turner, a vice-

president of the club, in the absence of Sir J. H. A. Macdonald, Lord Justice Clerk of Scotland, the president of the club, occupied the chair.

On the motion of Dr. Blair (Jedburgh), seconded by Mr. John Adam, the Right Honourable Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, was re-elected president of the club for the ensuing year.

The General Council was constituted as follows:—Henry M. Napier (chairman), John Adam, Dr. Blair, James Burns, J. Dall Crosbie, J. B. Talbot Crosbie, W. H. Kingsbury, George Macmillan, J. H. Irons, N. D. Macdonald, D. P. MacLagan, J. R. Nisbet, J. H. Paterson, H. Prosser, J. M. Ross, W. L. Sleight, J. B. Shanks, Stephen Smith, Robert J. Smith (hon. general secretary), William Weir.

The following noblemen and gentlemen were re-elected, by the General Council, vice-presidents of the club:—His Grace the Duke of Argyll, K.T., G.C.M.G., G.C.V.O., LL.D.; His Grace the Duke of Sutherland, K.G.; the Most Hon. the Marquess of Tweeddale, K.T.; the Most Hon. the Marquess of Ailsa; Colonel the Most Hon. the Marquess of Breadalbane, K.G.; the Most Hon. the Marquess of Linlithgow, K.T., G.C.M.G., G.C.V.O.; the Right Hon. the Lord Napier and Ettrick; the Right Hon. the Lord Saltoun; Colonel the Right Hon. the Lord Blythswood, LL.D., A.D.C.; the Right Hon. the Earl of Dalkeith, M.P.; Sir James Bell, Bart.; Sir Charles Cameron, Bart., M.D., LL.D.; Sir Archibald A. Campbell, Bart.; Sir Samuel Chisholm, Bart., LL.D.; Sir Lewis McIver, Bart., M.P.; Sir James Miller, Bart.; Sir James Pender, Bart., M.P.; Sir John Murray, K.C.B., LL.D., D.Sc., Bh.D., F.R.SS. (L. & E.); Sir John Ure Primrose, Bart., the Hon. the Lord Provost of Glasgow; Professor Dawson Turner.

Society of Motor Manufacturers and Traders.—The third annual general meeting of the society was held on June 22nd, at the Hotel Cecil, Mr. Sydney Straker, the president, in the chair.

The report and accounts of the committee of management, which were unanimously adopted, showed that the membership of the society had increased in the year by 100 new members, and that £5,000 had been invested, and £2,000 placed to deposit account. The profits of the Motor Show at Olympia were £2,684.

The following were elected members of the new council:—Messrs. H. Austin, H. G. Burford, G. A. Burls, A. Brampton, T. B. Browne, J. M. Brooke, A. Burgess, T. Clarkson, F. Coleman, T. G. Chambers, G. Du Cros, H. Du Cros, Jr., S. F. Edge, E. Gascoigne, A. C. Hills, E. M. C. Instone, Chas. Jarrott, Claude Johnson, H. Johnson, E. Kenealy, Frank Lanchester, Percy Richardson, Chas. Sangster, Fred R. Simms, Harry Smith, Stanley Spooner, Sidney Straker, H. Sturmeay, H. J. Swindley, W. Geo. Williams.

It was formally announced that the Prince of Wales had again consented to become patron of the society's show.

A Signifies accumulators; M magneto.

* Disqualified for second place because Demester changed a wheel during the race.

There were 12 starters; 10 finished 1st lap, 9 finished 2nd lap, 8 finished 3rd lap, 5 finished 4th lap, and 3 finished the race.

All engines had twin cylinders except those of the German team.

ON Sunday last (25th inst.), for the second year, twelve competitors, representing four countries—France, Germany, England and Austria—started for this race over the Dourdan course.

The course is situated south-west of Paris, through St. Arnault—where the start took place—Dourdan, La Forêt le Roi, Authon, and Ablis. Controls were established at St. Arnault, Forêt le Roi, Ablis, and Courville, at which places a total of 23m. were spent on each round. The complete course comprises five laps, which is equivalent to a distance of 167 miles.

Tyre troubles were, as usual, responsible for many failures. Franklin broke an inlet-valve, Campbell had trouble with his valve-operating gear and his ignition, and Collier suffered from his tyres, so that the English team fared badly. Toman (Austria) did not complete the first round, being thrown from his machine. Mueller and Genzel (Germany) both stopped short of the second round. None of the Germans did well, and all found it difficult to start their powerful single-cylinder engines. Demester was disqualified from second place because he changed a wheel during the race.

The following was the order of starting—the results being given below in tabular form:—1, Demester (France); 2, Mueller (Germany); 3, Campbell (England); 4, Toman (Austria); 5, Giuppone (France); 6, Genzel (Germany); 7, Collier (England); 8, Nikodem (Austria); 9, Cissac (France); 10, John (Germany); 11, Franklin (England); 12, Wondrick (Austria).

The machines were timed officially over the flying kilom. and flying half-kilom., Demester being credited with the best performance.

100-Mile Passenger Trial for Motor Cycles.—Under the auspices of the Motor Cycling Club a 100 miles' trial for passenger machines—one of the regular features of this club's fixtures—was run off on Saturday last. There were only six starters, viz., J. Van Hooydonk (4 $\frac{1}{2}$ -h.p. Phoenix Trimo), Leny (Humber bicycle and trailer), Lyons (6-h.p. twin-cylinder engine, Trafalgar side-car), E. March (4 $\frac{1}{2}$ -h.p. Phoenix Trimo), Priest (Quadrant Tricar), and H. Densham (Anglian Tricar, 2 $\frac{1}{2}$ -h.p. De Dion engine). The meeting-point was the Clayton Arms at Godstone, and the course 25 miles out to Felbridge, East Grinstead, Forest Row, and Chailey, then returning to Godstone, making a total of 50 miles. In the afternoon the same route was repeated, each 50 miles run having to be an absolute non-stop, the legal limit being strictly

enforced. A start was made at 11 a.m., and with the exception of the dust nuisance the weather was all that could be desired. During the morning run three of the competitors were eliminated—Densham and Van Hooydonk by tyre troubles, and Leny's machine succumbing to the stiff hill-climb at Forest Row. The other three competitors completed the afternoon's 50 miles' run successfully, and the winner was therefore decided by imposing a speed test over a measured distance of 100 yards on the flat and a hill-climb over 160 yards, the rapidity of stopping being a feature in the test. As a result of this final trial March was nominated the winner by three-fifths of a second on the two tests, Priest being second and Lyons third.

Catford Hill Climb.—The hill-climb organised annually by the Catford C.C. for so many years took place this year on Saturday last, at Westerham Hill. Motor cyclists were not allowed to pedal, trusting entirely to their machine. There were four classes, but Class III. was, for want of entries, abandoned. The weather was perfect, although a strong head-wind militated against fast times. The results were as follows:—

Class I.—Private Owners' Handicap. Motor cycles with cylinder capacity limited to 85 by 85 mm., or equivalent volume swept out. Ten entries, of which four machines climbed the hill. 1. (Gold medal) E. W. Goslett (N.S.U.), allowance 10 sec., time 1m. 34s.; 2. (Silver medal) H. G. Partridge (N.S.U.), allowance 12 sec., time 1m. 43s.; 3. W. A. Getting (3 $\frac{1}{2}$ -h.p. J.A.P.), allowance 10 sec., time 1m. 49s.; 4. J. P. Le Grand (3 $\frac{1}{2}$ -h.p. Kerry), allowance 5 sec., time 2m. 51 $\frac{1}{2}$ s.

Class II.—Open handicap for motor cycles, with minimum cylinder capacity 90 by 90 mm., or equivalent volume swept out. 16 entries. 10 starters. 1. (Gold medal) T. Silver, 3 $\frac{1}{2}$ -h.p. Quadrant, allowance 5 sec., time 1m. 27 $\frac{1}{2}$ s.; 2. (Silver medal) W. W. Genn, 2 $\frac{1}{2}$ -h.p. Minerva, allowance 15 sec., time 1m. 34s.; 3. R. M. Brice, 3 $\frac{1}{2}$ -h.p. Brown, allowance 10 sec., time 1m. 34 $\frac{1}{2}$ s.

Class IV.—For fore cars, side cars, and trailers to carry two passengers. Engine power unlimited. 1. (Gold medal) W. Hodgkinson, 2-cyl. J. A. P. Trailer, time 2m. 1 $\frac{1}{2}$ s.; 2. Wilber Gunn, 10-h.p. Lagonda Tricar, 2m. 42 $\frac{1}{2}$ s.; 3. L. W. Bellenger, 2-cyl. Quadrant, 3m. 16 $\frac{1}{2}$ s.

Several objections were raised in regard to the awards, but no alterations were decided upon by the judge. Mr. F. Straight was handicapper, and Mr. A. G. Reynolds acted as judge.

Conversion of Mr. Edison.—This is not a Revivalist notice, but is designed to draw attention to the fact that Mr. Edison, after for so long maintaining that the ideal motor car of the future will be an electric vehicle using for preference, of course, an Edison battery, appears to have changed his point of view. At any rate, he has recently purchased two of the new 15-h.p. White cars, and as he is a good judge of an automobile this is a testimonial of which the White Company are naturally rather proud. They accordingly devote a leading article to the subject in the last number of the *White Bulletin*, which, as usual, is a highly entertaining publication, and as admirably illustrated as ever, one of the

most effective of the photographs showing the big squadron of White cars which took part in the New York automobile parade on the 29th of April last.

Record Airship Flight.—The celebrated Lebaudy airship on Tuesday created a new record flight. It ascended from the ground at 4.25 a.m., and continued in the air without even its guide-rope touching the ground for 3h. 11m., not coming to ground again before 7.36. It was subjected to manoeuvring tests all the time, going to and fro between Moisson and Freneuse, and repeatedly circling the clock tower at the latter place.

arm in arm across the road, they effectually stopped the progress of nearly all motor cars that they encountered. Presumably these people had been misled by some jargon that they had heard about pedestrians having the prior right to the road. In any case we fancy the Highways Act provides for the punishment of such senseless obstruction, and we are glad to learn that their names and addresses have been taken and that proceedings are to be undertaken against them. Probably a substantial fine *and* the costs of the prosecution may assist in bringing them to a healthier state of mind.

It has been calmly reported in the daily press that a cyclist, when riding along a road near Swindon, collided with a motor tricycle, with the result that he was thrown up into the air, turned a double somersault, and landed on his back unhurt. The cyclist has been so impressed by his involuntary performance, that rumour has it that he is now daily practising this trick turn with the assistance of the motor tricycle, and hopes before long to appear as a star performer at the principal London

music halls. A special form of pneumatic protection has, we believe, been fitted to the gentleman's back to assist his practice.

It is stated that a firm of American contractors is arranging for the organisation of a motor 'bus service to the Pyramids next season. It is evidently intended for tourists, for we are informed that an American, who is now doubtless engaged in reading up Egyptology for the occasion, is to accompany the 'buses, and shout information on the objects of interest passed to the passengers, through a megaphone.

A NEW MOTOR CAB.—The "Alexandra"—supplied by Dixi Motors, Limited. The chassis—which is a standard touring model—has a 6-8-h.p. twin-cylinder engine, and a three-speed gear-box. The body, which is constructed under the Whitehouse patents, has several novel features, to which we draw attention on this page.

The "Alexandra" Motor Cab.—Among the motor cabs now being manufactured are those of the Dixi Motors, Ltd., who control the interests of the Dixi touring cars in this country. The cabs supplied by this company—one of which is shown in our illustration—have the same 6-8-h.p. chassis as that of their small touring model. The engine has twin cylinders and a three-speed gear-box of the ordinary sliding spur-wheel type.

The body is constructed under the Whitehouse patents, and is peculiar for the sliding roof and the folding windows and doors, the latter being fitted with a safety device for the protection of the passengers in the event of a collision. A cab constructed on this principle was, it will be remembered, exhibited at the last Agricultural Hall Show. The front glass windows open outward under pressure from the inside, and in doing so lock the doors, so that in the event of an accident the passengers are unlikely to be hurt through breaking of the glass, and they are at the same time prevented from falling out because the doors are locked. The driver's seat is, it will be noticed, situated almost in the centre of the chassis, and a roomy luggage platform is available alongside, in addition to the capacity of the roof, which has a sliding tray to facilitate loading and unloading.

A MONSTROUS but at the same time ludicrous example of anti-automobilist frenzy was provided on the Brighton Road on Saturday last by six individuals (presumably congenital idiots). They are described as having been decently dressed *and* equipped with a certain amount of legal phraseology. Linked

HLH, the Grand Duke Michael of Russia has now secured his second Dennis Car, a photograph of which we are able to give above. The chassis is fitted with a 24-28-h.p. engine and is of the worm-driven live-axle type. His Highness when placing his order paid a visit to the Dennis Works, where he took great interest in the various processes of manufacture, and especially in the action of the automatic tools that are installed.

offence were made of attempting to commit suicide under a motor car.

At the London and District Motor 'Bus statutory meeting, under the chairmanship of Mr. A. A. Campbell Swinton, it was stated that allotments of shares had been made to about 1,230 shareholders. The chairman also announced that a large number of different kinds of vehicles had been examined and subsequently ordered, and that the greater portion of them were to be built in this country, although a good number had to be ordered from Germany to ensure early delivery. The first delivery of these vehicles is to be made about the end of July, and the company hope to have a certain number running early in August. In all cases, the body portion of the vehicles will be made in this country chassis only being procured abroad.

In the above photograph we show a charming specimen of a 30-h.p. 6-cylinder Rolls-Royce Car fitted with limousine body, built to a special design.

THE Local Government Board have notified the Brighton Council that they cannot agree to their application to borrow £4,000 to defray the cost of preparing the Madeira Road for the Motor Speed Trials in July. As generally understood, therefore, this item will be a charge in the ordinary course on the rates.

"LONDON Road Car shares rose 6½ on motor traction talk." This interesting piece of news is what appeared in the City column of a daily contemporary, and demonstrates the influence which already the motor omnibus installations are having upon the investment values of the great street omnibus companies of London.

FOLLOWING their visit to the Clement-Talbot Works, which we recently chronicled, a party of about 60 students from the Polytechnic School of Engineering, accompanied by Professor Spooner, recently visited Messrs. Clarkson's Steam 'Bus Works at Chelmsford. Mr. Emerson, in the absence of Mr. Clarkson, acted as cicerone to the party, and a very profitable and enjoyable visit resulted to the young engineers who took part.

THE latest case of attempted suicide under a motor vehicle was committed by a girl of the name of Olive Batsford, in High Street, Cheshunt, on Sunday afternoon, when she deliberately attempted to throw herself under the wheels of an approaching automobile. The driver, however, was too smart for her, and she escaped unhurt. She is now being charged with attempted suicide. Considering the effect that these attempted suicides are likely to have on the unfortunate drivers of the cars selected for their execution, one could almost wish, as we have before suggested, that a special

THE genius who developed the idea, of putting scent into petrol in order to make motor cars more agreeable to their opponents wants to develop his system. As a matter of fact, of course, the idea was based to a large extent upon a fallacy. For where a motor car stinks it is not generally the petrol that is to blame but almost invariably the lubricating oil, or the defective manner in which it is applied. It is now proposed to extend the system to railway travelling, and to apply it as a sort of completion to the proposed colour scheme that the electrified District and Metropolitan line suggest adopting. In that case we may look forward to travelling in lavender, rose, patchouli, or otherwise scented carriages. It is all very nice, but unfortunately what is a scent to one person is very often an egregious stench to another, and that is one of the snags in the proposal.

A novel application of the Ivel motor in France. The photograph shows one of these well-known agricultural machines at work in the vineyards in the South of France, in connection with the National Agricultural Show held at Bordeaux last month. The motor is hauling a 6-furrow plough.

The "Vieo" Spring wheel.

The "Vieo" Spring Wheel.—Important as the tyre question is for touring cars, it is likely to prove vastly more so for industrial vehicles, and it is, therefore, only natural that a great deal of attention should have been given recently to the design of spring wheels of various kinds. A number of these have already been described in our special series of articles dealing with this subject, and many others which have received our attention will be brought before the notice of our readers as space permits—including a similarly treated description of the "Vieo." The above drawings give a good general idea of the construction of the "Vieo" wheel, which has a number of rubber rollers, B, introduced between the "floating" rim, A, and the wheel proper, F, the rollers acting as elastic cushions, but not being called upon to take the "drive"; the "drive" is taken by brackets, C, bolted to the rim, and by stop-pins, D, fixed to the wheel. This wheel, which is the invention of Mr. G. Stewart Ogilvie, is to be put on the market under very favourable auspices, for Mr. S. F. Edge is to act as managing director for "Vieo," Limited, the company which has been formed to work the patent, and Mr. Chas. Sangster has also joined the Board.

Motor Questions in the House.—Lord Balcarras stated on Tuesday that all the notice legally required of regulations keeping motor cars out of Hyde Park was the posting up of the same at the entrances. Lord Balcarras also stated that the First Commissioner refused to set apart a road in Hyde Park for motor cars and bicycles, where they would be free from the dangers and smells arising from horse traffic. Replying to another question, Lord Balcarras also said that the First Commissioner would not cancel the regulation excluding motor vehicles from the Park from 4 to 7 p.m. daily.

At the same sitting, Mr. Soares received leave to bring in a Bill amending the Motor Car Act, the principal provision of which is to permit magistrates to inflict imprisonment for the first offence of furious driving.

Many very useful motor-dynamo plants have been introduced by the De Dion-Bouton Company for lighting country houses, and for other purposes where a supply of electricity is required in out-of-the-way parts. That of which we give an illustration above is a portable installation, mounted upon a tubular frame, and designed for horse haulage. It has a standard 4-cylinder 15-h.p. petrol engine coupled direct to an unusually light 10-kilowatt dynamo, and is rendered completely self-contained, with the necessary tanks, radiator, fan, and switch-board. The makers also build self-propelled plants of a similar kind, the power being transmitted electrically to the road wheels.

COMMERCIAL POINTS.

Pneumatic Tyres for Omnibuses.—At the reliability trials of the Hanover Automobile Club, held recently, pneumatic tyres, made by the Continental Tyre Company, were fitted to a heavy vehicle, the weight on the rear axle being 4,000 kilogs., and on the front axle 2,000 kilogs., in all considerably over 5 tons. The diameter of these pneumatic covers is 150 millimetres, which is about 6 ins. These tyres are reported to have run through the trials successfully, and are, we understand, to be introduced into England for motor omnibuses.

United Motor Industries, Limited.—Another edition of this firm's excellent catalogue is now available, and in it we notice certain alterations in prices, as well as additions to the list of goods stocked.

For those requiring motor lubricating oils and grease, the Stern Sonneborn Oil Company notify us they have established a store at Clermont Ferrand during the period of the Gordon-Bennett Race. From this store competitors can draw their supplies free of charge. The firm have also offered three prizes of the respective values of 500, 300, and 200 francs to the three cars lubricated with their oils which shall be first to complete the course.

THE Shrewsbury and Challiner Tyre Company, Limited, of Kay Street, Ardwick Green, Manchester, have, owing to their rapidly increasing business in pneumatic tyres, etc., been compelled to open an additional dépôt at Nos. 12 to 14, Ardwick Green. These premises will be specially reserved for the sale department for pneumatic tyres, tubes, and rubber goods required in the motor and carriage trade, and by this means the prompt execution of orders will be ensured. In addition to these specialities, the company also stock a large assortment of motor clothing, rugs, and accessories.

THE enormous business being done by the Continental Tyre Company, of Hanover, has, we learn, necessitated the increase of the capital by 1,200,000 marks. Over 4,000 workmen are being employed, day and night, to cope with the increasing demand.

NEW COMPANIES REGISTERED.

County Motor and Cycle Company (Limited), Church Road, Burgess Hill, Sussex.—Capital, £2,000 in £1 shares. First directors, Lieut.-Colonel J. Bridges Walker, J. Bury Walker, and G. L. Benbough.

French (Limited), 153, Great College Street, St. Pancras, N.W.—Capital, £100 in £1 shares. Object, to carry on the business of carriers of passengers and goods, dealers in motors, omnibuses, &c. First directors, C. W. French, C. H. French, and R. H. French.

Leete and Co. (Limited).—Capital, £3,000 in £1 shares. Object, to carry on the business of auctioneers, brokers for the sale or purchase of estates, motor car and automobile dealers and agents, &c.

Montgomery Motor Company (Limited).—Capital, £3,000 in £1 shares. Object, to acquire the business carried on by J. Montgomery, at 14, Lincoln Road, Peterborough, as the Montgomery Motor Company. First directors, J. Montgomery and J. Goode.

New Wheel and Tyre Syndicate (Limited).—Capital, £12,000 in £1 shares. Chief object, to adopt an agreement with the Richardson and Price Engineering Company, Limited. First directors J. Cooper, A. Perono, and S. T. Richardson.

Robinson and Hole (Limited), Rythe Works, Portsmouth Road, Thames Ditton, Surrey.—Capital, £3,000 in £1 shares. Formed, to carry on the business of manufacturers of motors, cycles, &c. First directors, C. H. Hole and H. W. Robinson (managing directors).

Swaledale Haulage Company (Limited), Fremington, Reeth, Richmond, Yorks.—Capital, £1,000 in £1 shares. Object, to carry on at Reeth, Yorks., and elsewhere, the business of hauliers, carriers of passengers and goods, letters to hire of traction engines, motor cars, &c. First directors, J. D. Chipchase, E. Cherry, W. Turner, and J. S. Wagstaff.

Warwick Motor Engineering Company (Limited).—Capital, £1,000 in £1 shares.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E. Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

14699. 30th June, 1904. Improvements in Carburettors for Use with Internal Combustion Engines. H. J. Lee and J. J. H. Sturme, both of Widdington Road, Coventry. The object of this invention is a carburettor that will automatically vary the relative proportions of fuel and air. There are six figures. Fig. 3 is a sectional elevation in a vertical central plane. The carburettor body has an inlet, *a*, for air, and an outlet, *b*, for connection to the engine. The petrol is supplied by the spraying jet, *c*, through the usual float-regulated feed-

varying the quantity of air admitted to interior of the throttle, *n*. On the starting of the engine a rich mixture is drawn in, air being admitted only by the hollow stem, *d*. With increased speed the suction acts upon the piston, *j*, which is raised against the action of the spring, *k*. Additional air then enters by the apertures, *s*, and a further quantity flows in by the annular space, *f*. With further movement the plate, *l*, will permit additional air to enter through the holes, *n*. With continued movement of the piston, *j*, under suction, the air in the space, *f*, will have access to the mixing-chamber by the ports, *i*, through the passages, *w*, and by the passage, *z*. June 1st, 1905.

11866. 24th May, 1904. Improvements relating to Wheels for Vehicles, Agricultural Implements, and the like. J. M. Boulanger, Revigny, Meuse, France. The object of this invention is an improved wheel for vehicles that shall be stronger and more rigid laterally, and which shall be capable of adjustment for removing the slackness caused by contraction of the wooden spokes. There are eight figures,

secure half the alternate spokes to that side of the hub. The alternate spokes, *r*¹, on the right hand side of the wheel have also on their insides an annulus or ring, *o*, and on the outsides an annulus, *p*, against which the nut, *v*, presses. The rings, *o* and *p*, are also held together by bolts, *n*. A washer, *u*, is fitted in front of the nut, *v*, having stamped projections or bosses fitting recesses in the ring, *p*, so as to prevent the accidental loosening of the nut and washer. The tightening of the nut, *v*, The sleeve, *q*, surrounding the axle fits between the rings, *o* and *p*, and forms the inner support for the ends of the spokes, *r*¹. Tightening the nut, *v*, which is locked by the cap nut, *z*, puts the spokes, *r*¹, into compression, which compression is transmitted to the spokes, *r*. This arrangement appears to overcome the difficulties caused by the contraction of the wood spoke, as a slight turn of the nut will remove the resulting slackness. An improvement particularly useful for tropical climates where the effects of drying and contraction of the spokes are more pronounced. June 1st, 1905.

chamber. Surrounding the jet, *c*, is a fixed hollow stem, *d*, having openings at its lower end for air. In the chamber above the jet or nozzle is fixed a sleeve or liner, *e*, forming annular spaces, *f* and *g*. Within the liner, *e*, is a piston-valve, *h*, the lower part of which forms a space or chamber, *i*, round the stem, *d*. Within the piston, *h*, is fitted an auxiliary piston or plug, *j*, having a flange at the top into which is fitted the spring, *k*. The upper end of the spring fits against the plate, *l*, covering the air-admission ports, *m*, in the throttle, *n*, and cover, *o*. Between the two is fitted a perforated disc, *p*, which is rotated to cause the holes therein to register or otherwise with the ports, *m*, thus

of which Fig. 2 is a sectional elevation. The rim is in two parts, *a* and *a*¹. The part, *a*, of the rim is rivetted to the bar, *e*. The part, *a*¹, of the rim is removable. Upon the circular bar, *e*, are rivetted at intervals for the reception of the spokes parts, *f*, which carry the sockets, *g*. The rim, *e*, also carries angle pieces, *i*, which serve to secure the portions of the rim, *a*¹, in position. The parts, *f*, are rigid with the portions of the rim, *a*¹, and are connected to the parts, *i*, by bolts, *k*, and nuts, *m*. This combined rim is thus formed for pneumatic tyres with wired edges. The hub, *s*, has a fixed flange at *l*, and the movable annulus or ring, *o*, secured to the flange by means of bolts, *n*. The flange, *l*, and the ring, *o*,

PASSING EVENTS.

Saul among the Prophets.

"I DO not agree with this conviction. I must say that I yield to no one on this Bench in my desire and determination to do what I can to put a stop to driving recklessly and at excessive speed or to the danger of the public; but I say publicly from this Bench that this crusade against motorists in the country is being waged with a reckless disregard for fair play, and is bringing the magistrates' justice into disrespect and making this Bench in particular a byword and a laughing-stock among sensible people all the world over.

"I do this with a full knowledge of the responsibility I take in making these remarks; but as one of the Guildford Bench I feel very deeply the reflections which have been cast upon us in the public Press and elsewhere, [and I think it my duty to make this protest."

The court was crowded, and Mr. Lambert's remarks called forth some applause.

This is what Mr. Lambert, one of the Guildford magistrates, said on Saturday last, when a motorist had, as usual, been convicted by the Bench for the usual offence on evidence, which one of the magistrates, at any rate, clearly regarded as of the flimsiest description. It is a very unusual, almost an unprecedented, occurrence for a magistrate to rise from his place on the Bench, and publicly dissociate himself from the action of his brother magistrates in such uncompromising language. It is also confirmation of our contention that recognition of the importance of the automobile movement is penetrating more and more, even into that stronghold of prejudice, the magisterial bench. It is proof of another thing, too, and that is, that what has been written on the subject of magisterial prejudice, corrupt and untruthful police evidence, and all the scandals and injustices of innumerable motor car prosecutions, has produced its effect. It has brought one magistrate, at any rate, on a notoriously prejudiced Bench, to recognise that constant exhibitions of unfairness to automobilists is raising a serious degree of hostility against magistrates and police among exactly the classes of society who would naturally be solidly ranged on the side of the very authorities who have gone out of their way to alienate them.

There are people who think that it is better to let such things pass, who suggest that pointing out the truth only irritates the unfair and the prejudiced to take action more repressive and unfair still. The remarks of Mr. Lambert are a refutation of this idea. It shows that the truth, when properly put forward, makes converts even in the enemy's citadel.

The Last Tournament?

It would seem that there is some chance that the Gordon-Bennett Race, which such large numbers have thronged to witness this week on the Auvergne Circuit, may prove to be the last. At any rate the French Club have now officially decided to abstain from taking part in it in 1906, and will neither offer nor defend any challenges for that year. They do not say anything about the year 1907, possibly because they may think that if the Gordon-Bennett Race is killed for one year it cannot be resuscitated subsequently. It is not *altogether certain* that the abstention of a single club, even if that club be the A.C.F., will necessarily kill the Gordon-Bennett Race. After all, though France may be the centre of the world, it is not the world itself. There are other countries which produce automobiles, some of them even rather good ones. There is also a possibility that France *may* lose the race, though considering that all the French drivers have been practising for months over the course, that they have run the French

Eliminating Trials on the actual racecourse itself and that the facilities for other competitors to practise on the route have been—to say the least—restricted, this contingency is perhaps remote. But should the French win the race and refuse to defend the Cup, if challenged, for next year, the situation will not be devoid of interest, and may ultimately develop features of comedy. If the club receives a challenge, it is obvious that it must either "pay or play." It must either hand over the Cup to the challenger when he has won it, or defend it by running against him. The rules of the Gordon-Bennett Cup evidently never contemplated such a contingency, but they do certainly ordain that the club that holds the Cup will have to arrange for the next race to take place in their country. The French, no doubt, can refrain from taking part, but the French Club is a party to the agreement, and it seems likely that if they are challenged, and the other clubs desire to run the race, the French Club may possibly be legally in a position of having to provide for the holding of a race in which they have decided that they will themselves take no part. Such a situation would not be devoid of humour. There is no power according to the rules for the French Club simply to surrender the Cup and get out of their responsibility. Probably the difficulty could be got over by the International Committee, but, whatever they decide, it is not likely that either they or Mr. Gordon-Bennett himself will allow the race to be killed by a dog-in-the-manger attitude. The French Club must either "pay or play." It cannot retire into a corner and say it will do neither.

There is one solution which we offer to the French Club, though we fear they are not likely to accept it. Rule 20 provides that should the club holding the Cup become extinct, the Cup is to be returned to Mr. Gordon-Bennett, or in default to the A.C. de France. Let the French Club, then, agree to "extinct" itself, and the trouble will be got over, though we fear this is merely a counsel of perfection.

Not Necessarily a Serious Loss.

THE general impression prevails that the action of the French Automobile Club is dictated by the desire to ensure the inauguration of a race of their own next year, on the lines which we have so frequently discussed and criticised, viz., that France should possess such an overwhelming preponderance among the competitors as would make the French victory a foregone conclusion. This may be the case. But there is also a possibility that wiser counsels may prevail. The Marquis De Dion, at any rate, is in favour of organising an event which will be less of a race than a reliability trial, and extend over some 2,500 miles. We don't as yet know particulars, but it would seem that the idea is to approximate more or less completely to an English reliability trial. Needless to say, we should be heartily in favour of such a suggestion. Automobilists and engineers have learned all, or nearly all, that racing on the Gordon-Bennett lines can teach them. A change of character in the great events of the year from this point of view is needed, and if the Marquis De Dion's proposal, or some similar suggestion, leads to a practical result of this kind, it would tend to benefit the industry, and is certainly in accord with the conclusions to which our own club has come. At the same time, though there is not much use in protesting, we shall always protest against any proposal designed to give to France, or the French Club, undue advantages

in comparison with other countries. It is not fair, and it is not sportsmanlike, and we hope to see the notion abandoned. When the suggestion was first made, in regard to the Grand Prix, Frenchmen were by no means unanimous on the subject. The best of them were against it.

Appealing Tactics.

LORD WINDSOR, the First Commissioner of Works, has been subjected to a perfect fusillade of questions in Parliament on the subject of his exclusion of motor vehicles from Hyde Park during what are termed "society hours." To all these questions, which have suggested more or less directly that he might have modified the position which, fortified by the Lord Chief Justice's judgment, he has taken up, a stern *non-possumus* has been returned. The frontal attack upon him has therefore failed, but a new movement has now been organised. As most people are aware, the electric brougham is the vehicle specially patronised by ladies, and one of its many attractions to their eyes has been that it could be thrown open and enable them to indulge in a drive in the Park, at any time they wished, under practically ideal conditions. Now that the owners of these vehicles are no longer able to make use of them during the most interesting time of the day in this way, one of the chief advantages they possess for them has disappeared, and there is much unhappiness among the fair electromobilists in consequence. They have accordingly determined to try what feminine persuasiveness could effect where masculine directness has been unsuccessful, and a number of electric vehicles bearing their fair charges are accordingly to pilgrimage to Westminster for the purpose of obtaining an interview with the First Commissioner, and softening his heart to withdraw the unpleasant ukase. It is, of course, against the law that anything in the nature of a procession or demonstration should approach within a mile of the Houses of Parliament, but considering the specific nature of this demonstration, the law in this respect would hardly be enforced. What the results of their appeal is will be awaited with interest, as it will affect the convenience, and to some extent the happiness, of a very considerable number of the most prominent members of London society.

But Not Likely to be Successful.

MUCH as we wish well to the lady electromobilists' pilgrimage, we fear there is little chance of its proving successful in its object. We base this conclusion on the speech (which we reproduce elsewhere) made by Lord Windsor, the First Commissioner of Works, in the House of Lords, in reply to questions on the subject asked by the Earl of Rosslyn. From some of Earl Rosslyn's remarks it would appear that the action of the First Commissioner has been due to annoyance occasioned to Her Majesty the Queen by automobiles in the park. It must be admitted that Lord Windsor said nothing in support of this suggestion. At the same time it is significant that he did not directly deny it, and he took, *en preux chevalier*, all the responsibility for the ordinance upon himself. Lord Rosslyn's more or less discreet disclosure will probably have the effect of pouring oil on the troubled waters, for there is assuredly no one in the United Kingdom to whom Queen Alexandra's lightest wish would not be a law stronger than any on the Statute Book.

This is no doubt particularly the case among the users of the electromobile, and may help them to regard with more equanimity Lord Windsor's decision that he does not see his way to according them exceptional treatment, owing to the occasional difficulty of distinguishing certain builds of electric and petrol victorias from one another.

Not to Count as a Precedent.

As stated in another column, Earl Russell recently inquired whether, in prescribing the speed limit of 5 miles an hour in the town of Beverley, the Local Government Board thought it necessary to consult their Law Officers as to whether they had power to do so, and was informed that the Board had not considered such consultation necessary. Earl Russell, we think, was acting wisely in drawing attention to the subject. That a limit of 5 miles per hour has been decreed in Beverley matters not a brass farthing to anybody, and considering the character of the streets through that ancient town, it is probably a perfectly wise precaution to take. But the question is, has the Board power to make such an ordinance under the Act? With all respect we submit that they have not, and *had* they consulted their Law Officers they would probably have been told so. Under Section 9, the Board can only limit speed in any district on the application of the local authority to 10 miles per hour, neither more nor less. It is presumed that the 5-mile limit was imposed under Section 8, which empowers the Board to "prohibit or restrict the driving of any motor cars on any specified highway or part of a highway which does not exceed 16 feet in width." As a matter of interpretation, considering that speed is specially treated of in the next clause, it is obviously twisting the meaning of "restrict" to assume it to mean limiting speed below 10 miles an hour. Beverley, as we have said, does not matter, but the possible importance of the question is that some reactionary Board in the future may look upon Beverley as a precedent, and perhaps the automobilist members of one or other of the Houses of Parliament would be wise to elicit from the Board something of an undertaking that the Beverley case shall not be so regarded.

To Make Confusion More Confounded.

WE have all, at some time in our lives, seen the clever conjurer put the live hare, the Cheshire cheese, the old gentleman's top hat, and the brand new umbrella into a single quart measure without apparently interfering with its capacity for holding its legitimate contents. And when we were very young we wondered how all the things could find room in it. The Commissioners who recently concluded their sittings on the important question of London traffic seem to be of opinion that the London streets are like the conjurer's measure, that the more you put into them the more room there will be, for they positively—at any rate so it is alleged, for their report has not been actually issued to the public yet—propose to get rid of the existing congestion by running trams (of course, electric) along Piccadilly, Oxford Street, and Regent Street. No scheme for widening these thoroughfares is conceivably practicable, for even the national finances would be strained by the sum that would have to be paid for demolishing the houses on either side of these thoroughfares. It is treatment by contraries with a vengeance, *i.e.*, attempting to combat an evil by measures that would naturally tend to make it much worse. The condition of affairs at Piccadilly and

Regent Circus is bad enough now in all conscience, and what it will be when two lines of trams cross one another at these points the most irresponsible prophet would hesitate to predict. If this is the best that the collective wisdom of London and Parliament can suggest at a moment when even the small number of motor 'buses are showing their capacity for coping with traffic, without congesting it, then London will deserve to go down to history in company with Schildburg and Gotham. "I called you in," said the indignant English inn-keeper to the Irish policeman, who commenced to partake of hospitality with an unruly guest, "to eject this customer, not to drink with him." The Royal Commission on Traffic has been called in to devise means for combating the congestion, and they promptly propose to make it much worse. Ultimately the Irish constable and the unruly guest went off peaceably arm in arm, but there will be no room for anybody to go arm in arm or otherwise along Piccadilly Circus, Oxford Street, or Regent Street if this egregious proposal is ever actually carried out in practice.

Justice in a Bad Case of Obstruction.

ALMOST every automobilist of experience has suffered at some time or other from the surly obstruction which drivers of horse-drawn vehicles, particularly of the more lumbering sort, delight to exercise when they see a motor car approaching. Seldom have these offenders against the highway law been brought to book, motorists in general having put up with their insolence, partly, no doubt, from a belief—too widely justified, we fear, at any rate in the past—that justice to the automobilist is a thing that no one need expect at the hands of many benches of magistrates. It is, therefore, with considerable satisfaction that we draw attention to a case reported in full in another part of the present issue, in which an automobilist, endeavouring to pass a brake filled with beanfeasters, sustained severe damage owing to the abuse of the highway of which the latter was guilty. After the brake had obstructed the motor car for some time by occupying the whole road in front of it, it drew to the side, but just as the latter was utilising the opportunity to attempt to pass, in response to a signal to proceed, the brake was purposely deflected towards him, compelling him to drive on to a high pathway, which injured the car. The injury to the motor car brought it to a standstill, notwithstanding which, however, the brake of beanfeasters drove on without taking the slightest notice. The driver of the beanfeasting brake was prosecuted before the Barnet Police Court, on June 28th last, by Mr. Kingsbury, the owner of the automobile, supported by the Motor Union. The magistrates considered the case to be an especially bad one, and fined the defendant £5, the maximum penalty, and 12s. 6d. costs, with the alternative of a month's imprisonment.

More Thames Conservatism.

LITTLE attempt has been made, it appears, to enforce the recent ukase of the Thames Conservators prohibiting petrol motor boats from entering locks at the same time with ordinary row-boats. We conclude that this is due, as we suggested at the time, to the impracticability of carrying out such a suggestion. To keep half a dozen motor boats out of a lock because one row-boat was in it would be ridiculous, as also would be the converse process of keeping out a whole crowd of rowing boats because one small petrol boat might happen to have first

entered the lock. The Thames Conservators, however, are not giving up the question, and at their last meeting it was announced that they are drafting by-laws to deal with the question. We look forward to the appearance of these by-laws with some interest. It would appear that the scare itself is to some extent due to Dr., recently made Sir, Boverton Redwood, and Capt. Thompson, the Chief Inspector of Explosives, and that it was their observations, when consulted by the Thames Conservators, that had put the fear of the petrol boat in their minds. As the by-laws are now being framed, and as we are informed that this will be an elaborate and lengthy process, and that it will be some time before they assume their ultimate form, we would once more draw the attention of the Thames Conservators to the fact that though a large number of petrol boats have been regularly navigating the Thames for a period of years, accidents of any kind due to causes of which the Conservators are now so much afraid, have been conspicuous by their absence.

Over the Bridge at Last.

THE London County Council has at last won the victory, and the Court of Common Council has agreed to permit the County Council's trams to run over Blackfriars Bridge and along the Embankment. It is to some extent a Pyrrhic victory for the Council, for the concession has only been allowed on the condition, suggested some time ago, and chronicled by us at the time, that the Council should undertake the widening of the bridge or building another one. This is the second important recognition (the first was at Brentford) of the fact for which we have long contended, that where rights are conferred on tramway companies, they should be compelled to widen the highways along which they lay their tracks, and we are thankful for this important recognition of the principle. At the same time it is impossible to feel indifference to the further permission granted them to run the trams along the Embankment. It will be very little good, as we have already pointed out, to the public, and it will largely spoil the really finest thoroughfare in London. There are grounds of public policy perhaps in favour of extending the Blackfriars Road trams over the bridge to the north, but there do not seem to be any whatever for running them along the Embankment.

A New Automobile Association.

It has for long been notorious that while the law against motor car owners is enforced to the last letter, with a large proportion of prejudice and unfairness thrown in, the police regularly wink at infractions of the highway laws of all sorts by the drivers of horse-drawn vehicles. What is really needed in the interests of the automobile movement is a fair and impartial administration of the law without respect to persons. With a view of ensuring these ends and also combating action designed for the annoyance and restriction of the rights of automobilists, the Automobile Association was formed on the 29th of June at a meeting held at the Trocadero Restaurant. The new Association is intended to include a specially strong legal department for the assistance of its members, and is designed to come to their support, particularly in all cases of litigation involving automobile interests in a substantial manner.

THE GORDON-BENNETT RACE.

GORDON-BENNETT RACE.—Théry, the winner, returning into the Laschamps enclosure on his Richard-Brasier Car.

MOTORING TO THE AUVERGNE CIRCUIT.

By Charles Jarrott.

OF course, the chief difficulty on the morning of the start was to get the various members of the party out of

bed. We had three cars, and had arranged to make the run through from Paris to Royat, 390 kiloms. in the day. Mr. Nicholas Wood, accompanied by Mr. J. Charlton and M. Deland, was driving his 50-h.p. Panhard; Mr. G. Du Cros with Mr. Willie Du Cros, Mr. Alfred du Cros and Mr. Harvey Du Cros, were on a 24-h.p. Panhard; and Mr. Letts and myself on a 24-h.p. De

At La Cratiere. Vauriat Bridge.

AUVERGNE CIRCUIT.—A glimpse of the exquisite scenery on the Course. Heath on his Panhard during the French Race.

Dietrich with a racing body. The start from the Hotel Continental was fixed for 6 o'clock, but by the time the various members had been roused from their slumbers, and had collected their luggage, &c., it was nearer 7.30. A stop at Messrs. Panhard and Levassor's Works in the Avenue d'Ivry for spare tyres made a further delay, and it was half-past eight before we passed through the gates and got upon our way.

The three cars proceeded in a very sedate fashion

until a car of uncertain h.-p. came by, having discarded its exhaust-box with the idea, I presume, of obtaining more speed and emulating a racing car. With a broad, wide-open road stretched before us, the supercilious expression of the driver of the car of uncertain h.-p. was more than human flesh and blood could stand, and immediately throttles were opened, and away we all went in pursuit. Something happened to the 50-h.p., though what it was none of us knew. The chase was a stern

GORDON-BENNETT RACE.—Théry passing through Rochefort.

one, and we found ourselves at Melun almost before we realised that we had started, having succeeded in convincing the little man on the car of uncertain h.p. that the 24-h.p. De Dietrich, even with the exhaust-box on, was a little bit better than his car without one.

The only member of the party who had not appeared was Mr. Wood, on the 50-h.p. Panhard, and although we waited a considerable time, we had to resume our journey, believing that he would eventually pick us up on the road. A glorious day on a speedy car on a French road is to my mind an ideal of luxury, and of the many enjoyable runs I have had in France none have I enjoyed more than my run to Royat on that occasion. The 24-h.p. De Dietrich was upholding the reputation of its

makers in splendid style, and we were able to keep company throughout the whole of the journey without difficulty, the magnificent stretch of road through Nevers and Moulins being as good as anything I have yet travelled over. By the way, I would like to mention that the Hotel de France at Nevers is excellent, the proprietor having been *chef* at the Lord Warden Hotel at Dover for a number of years.

Arrived at Royat, one of our difficulties was to find garage accommodation, and it was only by the ingenuity of the French mechanician I had on my car that we were able to find any room at all for storing the cars for the night.

So much has been said about the scenery in and

GORDON-BENNETT RACE.—Caillols passing the Grand Stand on the Auvergne Circuit.

Photo by Michelin and Co.

about the racecourse that it is unnecessary for me to say anything beyond stating that it is exceedingly charming.

At four o'clock in the morning the 50-h.p. Panhard arrived, having had exceedingly bad luck all the way through with tyre troubles, and unluckily meeting with rainstorms which we fortunately in our flight had escaped. The next morning saw us out on the course viewing the weighing in of the cars. I must say that I was agreeably surprised with that portion of the course that I had an opportunity of going over. Undoubtedly it is very "cornery," and if proper caution is not exercised serious accidents will doubtless result; but at the same time the road surface itself is good, and some of the bad

corners have been beautifully banked, and compared with the road over which our English cars were tried in the Isle of Man, the course is almost luxurious. Undoubtedly to get the best average speed it has to be studied carefully, but I certainly fail to understand why the course has been universally condemned. One thing is evident, and that is that only an excellent car and an excellent man can hope to make the race successfully; and after everything is said and done, if this is not the result which is aimed at in automobile racing what is the use of it? We have been convinced through the Ardennes Races and the Paris-Madrid Race that terrific speeds can be attained along straight roads, and there-

GORDON-BENNETT RACE.—Duray on his De Dietrich Car at full speed, after passing Laschamps.

Photo by Michelin and Co.

GORDON-BENNETT RACE.—Caillots on his Richard-Brasier Car in Clermont Ferrand.

fore I can see no objection to a difficult course being chosen, and the makers induced to construct special vehicles specially suitable for a hard and trying race.

From a racing point of view one could not help being impressed with the construction of the Richard-Brasier cars. Even the day before the French race they looked capable of winning, and there was no question but that all the competitors looked upon the three Richard cars as being particularly deadly. The De Dietrich vehicles struck me as being specially fine specimens of racing cars, and they were undoubtedly the best racing cars Messrs. De Dietrich themselves had ever made. There was no doubt about the cars being strong enough to stand the course and they were unquestionably very powerful. The Clement cars were also rather nice vehicles from a racing standpoint, and altogether it was very clear that a terrific fight would take place on the following day for

the first three places. Our party had the pleasure of sitting down to luncheon with the Chevalier Rene de Knyff, and with M. Clement and M. Hocmeille, and it was evident from the information the Chevalier gave me in connection with the arrangements made by the Automobile Club de France for the race that everything possible had been done to make the event successful in every way, both in the direction of obtaining information of the various competitors during the race and in the safeguarding of the public and competitors.

At three o'clock on the following morning we were up and away to the start. There is a long climb which has to be made out of Royat up to La Fontaine de L'Arbe. At this point a tunnel has been constructed beneath the road, which enables cars to be driven through, and thus get inside the circuit. A little narrow rough road has

GORDON-BENNETT RACE.—Caillots on his Richard-Brasier Car taking a down grade at top speed on the Auvergne Circuit.

Land's End to John o'Groats and back.

been constructed from this point right round to the Grand Stand erected at the starting point. We drove over this narrow road, and left our cars close to the Grand Stand, and after we had seen one round of the race we were able to take our cars along round the Puy de Manson to Olby, and from there to the course, being in a position at this point to see the cars in full flight.

The race itself has been described at length, but I received a few impressions which are perhaps worth mentioning. Firstly, I was exceedingly impressed with Wagner on his Darracq. Timing all the cars up to a

given point at the start of the race, he was certainly travelling faster than anyone else, and afterwards I had the opportunity of seeing him take two dangerous corners on the course, and his driving was magnificent. Other drivers in the event took the corners in beautifully clean fashion, but no one with the devil, dash, and speed of Wagner, and at the end of the third round I believed him to be certain of a place in the team. Duray, also, on his De Dietrich, was exceptionally brilliant on this spot, whilst the driving of Théry and Hanriot was remarkable for its cleanness, the curves being taken in an

AUVERGNE CIRCUIT.—A specimen of the barricading on the course at dangerous corners. Gabriel on his De Dietrich rounding the Laquéuille turning during the French Race.

AUVERGNE CIRCUIT.—De La Touloubre taking a sharp corner in grand style with his Darracq during the French Race.

exceptionally fine manner. Whilst we were viewing the race at this portion of the course, I had the opportunity of a long chat with my old friend the Baron de Caters, and he told me, from his own experience, that whilst the course was not good, in view of the fact that there were so many corners, at the same time it was not exceptionally bad. He was very confident that the Mercedes would put up a very fine fight for the cup.

Of course, during all this time we were entirely in the dark as to who was actually leading, and we therefore made our way back to the starting and finishing point to ascertain the news. We then learned that Théry had finished, and that other cars were finishing quickly all the time, but no one could say who had actually won

owing to the fact that all the telephone wires to the various controls had been cut, thus making it impossible for the times to be worked out, allowing for the stoppages in the controls. However, M. de Knyff gave us the names of Théry, Duray, and Callois as being the three leaders, and we left for Royat gratified beyond measure that we had witnessed one of the finest automobile races that had ever been run. The fight throughout was of the fiercest description, Théry, Wagner, Duray, Callois, Sizsz, and Heath all apparently having the race in their hands at one time or another. There is no question but that three magnificent cars will represent France in the race for the Cup on the 5th.

I may say that I left the course feeling very gloomy,

MOTORING TO THE AUVERGNE CIRCUIT.—Messrs. Harvey Du Cros, Alfred Du Cros, George Du Cros, Willie Du Cros, Charles Jarrott, and W. M. Letts, formed a party to motor to the Auvergne Circuit to witness the French Race, their experiences being of a particularly pleasant nature, a few points in connection with which we are able to give this week from the pen of Mr. Charles Jarrott. In the above pictures, which Mr. Charles Jarrott has also sent us, the scenes are (1.) Outside the Castel Hotel, Royat, in which, in addition to most of the members of the above party, Mr. Bianchi and Wild his mechanician on their Wolseley Car appear in the photograph. 2. is a temporary halt at Melun, and 3. a rest for refreshments en route.

as we had the news given to us, at almost the last moment, that Giradot had had a terrific smash and was killed, and, remembering him as one of the o'd sporting crowd in the days of Paris-Bordeaux, Paris-Berlin, Paris-Vienna, and a dozen other races, it seemed an unhappy ending after having safely escaped so many dangers, and it was with a feeling of the greatest relief that we heard afterwards in Royat that the news was happily untrue, and that Giradot, though badly knocked about, was still in the land of the living.

Once back in Royat, we lost little time in getting on to the road again, and eventually arrived back in Paris with the three cars at two o'clock on the following afternoon, in ample time to catch the four o'clock train back to London.

The Gordon-Bennett Race of 1905, will, I believe, excel in excellence any race before run, and as automobile racing, seen under the conditions it will be seen under in this event, will undoubtedly soon be a thing of the past, I for one do not propose missing the closing scenes and events of a sport of which there is none greater, my one regret being that I shall look upon the fight as a spectator and not as a competitor.

THE GORDON-BENNETT RACE.

THE EVE OF BATTLE.

It is weighing-in day for the competitors in the great race, and excitement reigns on all the principal points of the Auvergne Circuit. Everything is enthusiasm and dust, and yesterday there was a battle of flowers. There has been no rain for a length of time, and on the volcanic soil of Auvergne, tufa, felsite, and the rest of these friable rocks, this means that the dust is stifling. So far the anti-dust preparations that have been employed have been far from successful in getting it under. All the inhabitants of Clermont Ferrand and Royat seem to live in the streets, and their ranks are being rapidly recruited by the throngs that pour in by motor car, by train, and by bicycle. The number of excursionists probably exceeds that to the Taunus course last year, and innkeepers and everyone who has even a cattle-shed to let, are reaping a tremendous harvest. They do not enjoy quite such a monopoly, however, as their colleagues in Germany did. Large numbers, scared by the huge prices demanded, have erected tents and are camping

and tent pegs and expressing themselves with much picturesqueness in several European languages. The wind, however, is sometimes "tempered to the shorn lamb," and though the untented enthusiasts were angry and dusty, they still remained dry, for the simoon did not bring with it a single drop of much needed rain.

Excitement runs high. The school children in all the Auvergne towns and villages have been promised a holiday to see the race, and all the local barbers have decided to do the same, and have posted up notices that they will shave nobody on the day of the great event. Never before, we believe, has a race produced such an effect.

REGARDING the British chances in the race, the Hon. C. S. Rolls, who was generally credited with having had most practice with one of the Wolseley racers prior to the race, wrote us in a somewhat despondent mood of the 177 corners, to be negotiated four times, which it was necessary to know by heart before they could be taken with assurance at the maximum safe speed. Mr. Rolls commended the work of the French Club in going to so much expense in re-tarring the road, building bridges, and banking corners, but for all that, as we have before stated, the British team were seriously handicapped by the fact that they could not practice over the course adequately since the team was selected. In addition to this, Mr. Rolls remarks on the lack of sufficient power in the English-built racers, this point being of immense importance on such a course, where the acceleration powers of the cars have to be brought into play literally hundreds of times during the complete circuit.

Earp, who was England's first representative, must have found the course more than trying on the day of the event, for he had comparatively no practice at all. First, trying his 4-cylinder Napier, then off to London to fetch

GORDON-BENNETT RACE.—Herbert H. Lytle, one of the American team, on the 8-cylinder Pope Toledo Racer.

out in them, placing their reliance upon the fine dry weather. But they reckoned without the local deities, who control the weather arrangements in the volcanic Auvergne, where the bare peaks of the Puys, rising to considerable altitude with their heat-absorbing lavas and trachytes, become baked to a tremendous temperature in the July sunlight, and the upward currents of air are always liable to produce local tornadoes and dust storms like those of the Cordilleras on a small scale. One of these Auvergne simoons swept up on Tuesday at the very moment when the cars were being weighed at Laschamps, and overthrew the tent over the enclosure in which the weighing was taking place. Cars, officials, drivers and spectators were whelmed in one *debacle* of swirling tarpaulin, and a tent-peg was thrown into the face of an English mechanic, gashing him considerably.

The Auvergne local deities are evidently intensely patriotic, as indeed they should be, remembering Turenne and La Tour d'Auvergne (the First Grenadier of France), and they seem to have concentrated their fury particularly on the tents where the Wolseley cars were housed, which collapsed in a heap, burying their attendants with them in the *débris*. Fortunately when the wreckage was removed, it was found that no trace of injury had been suffered by the English cars.

The simoon, too, wrought great destruction in the "tented field," where the numbers of excursionists, as stated above, were camping out, and most of them were subsequently running after their canvas

Wolsely.—Horizontal engine. cast separately.

Cast-iron liners in aluminium jackets. Heads cast separately. Wheels stayed with wire spokes.

the 6-cylinder machine, which he took round the course for the first time on Saturday last, Earp's time gave him little opportunity for practice, and still less for knowing such a course as that on which he bravely set forth to uphold England's glory on Wednesday morning. There was at one time considerable doubt as to which car Earp would actually drive on the day of the race. As a matter of fact, he actually drove the 6-cylinder car, and with so little time to pick and choose, it is almost a pity he had ever to be in doubt.

Bianchi, whose style of driving in the Isle of Man won him much enthusiastic support, only had a few turns round the course, as for a period his essays were interrupted by a smashed gear-box—the unfortunate result of his foot accidentally slipping off the clutch-pedal one day.

Much rivalry existed prior to the event between the French and German teams, or perhaps it would be more correct to say between the supporters of Théry and those of Jenatzy. Both drivers more or less lived on the course, but Théry gave his car a rest, and practised on another towards the end, while Jenatzy upheld the principle of giving faults every chance of developing in advance. Jenatzy was popularly credited with having accomplished the course several minutes faster than Théry's best "eliminating" time. Too much credit must not, of course, be given to mere rumours; but that they were well founded on fact in this case is not altogether unlikely, judging from the results of Wednesday's race. Both Théry and Jenatzy are undoubtedly first-class drivers, and it was to them that everyone turned—irrespective of nationality—for an exhibition of how to negotiate that course in the highest of high-class style.

Other members of the French and German teams were perhaps rather overshadowed by the fame of their illustrious *confrères*, but the driving of Caillaud, on his Richard Brasier, and Duray, on his De Dietrich, was always interesting, while that of De Caters and Werner, on their Mercedes, did much to affect the German chances of success. The Mercedes cars, which represented Austria as well as Germany, had thus six strings to their bow, but no one allowed very much for the efforts of the Austrian team, because they had had insufficient practice on the course. Incidentally, too, it has been demonstrated by the result that mere multiplicity of strings to the bow of any one competitor is no guarantee of success.

The Italian team, with the splendid Fiat cars, was very conspicuous on the course before the event, and all these drivers undoubtedly showed to advantage, more especially Lancia, who, as also Cagno, was one of Italy's representatives last year.

None of the American cars appeared to be capable of excessive speeds, although prior to the race their performance was distinctly better than was generally anticipated. Lyttle was credited with plenty of reserve power, and was undoubtedly the favourite of the American team.

THE RACE.

PRELIMINARY RESULTS OF THE GORDON-BENNETT RACE, AUVERGNE CIRCUIT, JULY 5th, 1905.

Place.	Country.	Car, Official Number, and Driver.	Gross Running Times per Lap (85.3 Miles).								Gross Time for the Circuit (341.2 Miles).	Acceleration 1 Kilom. Time.

	America	Locomobile (18), Tracy	...	2	42	51	Retired						—			63	

The following is a list of the official numbers and the times of starting:—

Official Number.	Time or Start.	Driver, Country, and Car.
1	6.0 a.m.	Théry (France), Richard-Brasier.
2	6.5	Clifford Earp (Great Britain), Napier.
3	6.10	Jenatzky (Germany), Mercedes.
4	6.15	Lancia (Italy), F.I.A.T.
5	6.20	Braun (Austria), Austrian Mercedes.
6	6.25	Lyttle (United States), Pope-Toledo.
7	6.30	Cailliois (France), Richard-Brasier.
8	6.35	C. S. Rolls (Great Britain), Wolseley.
9	6.40	De Caters (Germany), Mercedes.
10	6.45	Cagno (Italy), F.I.A.T.
11	6.50	Hieronymus (Austria), Austrian Mercedes.
12	6.55	Dingley (U.S.A.), Pope-Toledo.
13	7.0	Duray (France), De Dietrich.
14	7.5	Bianchi (Great Britain), Wolseley.
15	7.10	Werner (Germany), Mercedes.
16	7.15	Nazzari (Italy), F.I.A.T. cars.
17	7.20	Burton (Austria), Austrian Mercedes.
18	7.25	Tracy (U.S.A.), Locomobile.

The following table shows at what time the race was to be declared over at various points of the course. Cars entering any control after the hour here stated not being allowed to proceed further in the race:—

Place.	Time.	Place.	Time.
	p.m.		p.m.
Laschamps	3.35	Chambon	4.23
Quatre Routes (Nebouzat)	3.39	Pontgibaud	4.37
Rochefort	3.48	Vauriat	4.41
Lagueville	3.54	Volvic	4.46
Bourg-Lastic	4.2	Quatre Routes (Clermont)	4.55
Hermeut	4.12		

This table is calculated on a basis of 1 h. 25 m. for the circuit, an allowance which is 11 m. less than Théry's best time in the eliminating race, so that although 3.35 p.m. appears to be an early time limit for

Laschamps, it was not unreasonable to suppose that any car leaving after that time could not complete another lap before 5 p.m., at which hour—as we stated last week—the race officially finished.

The storm of the previous day continued into the night, and many of the unfortunate campers-out, whom the simoon had deprived of their tents, must have felt pangs of envy regarding their more fortunate confrères who had succeeded in obtaining accommodation in permanent structures in the towns and elsewhere. Not that anybody got much sleep. Enthusiasm, noise, excitement, banners, flags, triumphal arches and immense numbers of electric lights

were everywhere, and from two o'clock, before it was even really grey in the north-east, there was a constant procession of cars bringing spectators to the various points of vantage. Unlike the morning of the Eliminating Trials, the dawn broke cloudy and boisterous, but before the sun was well up the clouds broke, and blue tracts of sky heralded a splendid day, during which a little not unwelcome rain fell about noon.

By four o'clock the grand stands had already some occupants, and at that hour M. Clementel, the Minister for the Colonies, drove up in his motor car and interviewed all the competitors in succession, to whom he wished good luck—a hope from which not all of them obviously could benefit—and bestowed upon them a fatherly caution to be extremely careful.

At five o'clock all the competing cars were lined up in their order of starting, and the start itself took place with the fine punctuality (which has always characterised the French management of events of the kind) to the very second at six o'clock, the grand stand, however, not by that hour being very full.

Great as were the numbers who had thronged towards the course on the previous day, one was scarcely prepared for the enormous crowd that witnessed the start. Expecting, of course, to find motorists of all nations predominating, most people were surprised by the number of peasantry who had come from very considerable distances to witness the great automobile race of the year. The enthusiasm for the automobile movement has penetrated into every rank of the French people.

The start, which took place at intervals of five minutes in the order we have indicated above, was uneventful. Théry got off in splendid style, passing away up the mountain road at a speed which covered the first kilo-

metre in 55 secs. He, of course, received a tremendous ovation from his countrymen, but the crowd was very good in this respect, and every starter was greeted with a most encouraging round of cheers. Earp's commencement of the race on the 6-cylinder Napier was splendid. He was a little slow at starting perhaps, but he got away with grand acceleration, and covered the first kilom. in 5 secs. better time than Théry. Nearly all the starts, in fact, were magnificent, Jenatzy, who had changed his tyres just before starting, even improving on the first kilom. by 2 secs., and covered it in 48 secs.—a feat which was due to his wonderful smartness in gear changing; he was followed by Lancia, beneath whose car the customary racecourse dog elected to immolate itself—though no ill result apparently followed to the car. Exception must be made as regards the representatives of America, who, however, were scarcely serious competitors, and whose starting was distinctly lame, although the coolness of Dingley, who calmly smoked a cigar, was highly characteristic of American nonchalance. Bianchi, who was amongst those who made a good start, was ultimately placed eleventh. It was calculated that Théry would return to the starting point within 15 mins. after the last car had been started on the first lap, and almost exactly at 7.41 he was sighted, and re-commenced the second round of the great contest, and about 10 minutes later Lancia, on the Fiat car, whirled past, to the great enthusiasm of the Italian contingent among the spectators, for this meant that their champion, driving splendidly, had gained some 6 mins. on last year's winner, and he still continued to gain till he was nearly 7 mins. more to the good at the end of the second round. This placed him in actual time about 2 mins. behind Théry, so as to be practically coming into sight by the time Théry had disappeared, and the excitement was accordingly tremendous. The official placing at the end of the first round was—

	h. m. s.		h. m. s.		h. m. s.
1. Lancia	1 34 57	4. Earp ...	1 54 11	7. Cailliois	2 0 50
2. Théry...	1 41 7	5. Cagno	1 54 44	8. De Caters	2 6 9
3. Duray...	1 49 27	6. Braun...	1 55 4	9. Jenatzy	2 9 41

At the end of the second, the relative position of the leading competitors was—

	h. m. s.		h. m. s.
1. Lancia ...	3 17 8	4. Cailliois ...	3 47 25
2. Théry ...	3 30 4	5. Rolls ...	4 8 50
3. De Caters	3 45 23	6. Jenatzy ...	4 22 13

De Caters and Cailliois, both of whom were tremendous favourites, being received with the greatest enthusiasm.

Jenatzy's displacement in the first round was attributed to trouble with his carburettor, which delayed him some eight minutes at the Moreno Pass. On the second round he made up a good deal for lost time, picking up from ninth to sixth place, but finally retired on the third round.

But, alas for the hopes of Italy. Driving splendidly, as he was, Lancia had misfortune, radiator troubles, it was said, on the third round, which knocked him out, leaving, however, the two other Italian Fiat drivers, Cagno and Nazzari, travelling in splendid style. In fact, the behaviour of the Fiat cars, and the perfect way in which they were driven, has proved one of the chief sensations of the 1905 Gordon-Bennett Race.

GORDON-BENNETT RACE.—The two Italian drivers, Nazzari and Cagno, who secured 2nd and 3rd places with their Fiat Cars.

At the end of the third round Théry was accordingly leading, closely followed by Cailliois, with the two Italians, Cagno and Nazzari, in hot pursuit.

Thenceforward Théry maintained his lead till the end of the race, finishing finely and, as usual, quite unruffled, in approximately 7 hrs. and 10 mins.—a wonderful and marvellously uniform performance considering the course. The three first places fell to:—1, Théry; 2, Nazzari; 3, Cagno.

Deeply as everyone will sympathise with Lancia's ill-luck, and pleased as everyone would have been to see a new country win the Cup, it must be admitted that the combined performance of Théry and the Richard Brasier firm is nothing short of phenomenal. For two years in succession they have won the Eliminating Trials and the Gordon-Bennett Race without, it may almost be said, a single screw getting out of place.

Of course, there was the usual emotional outburst. Crowds surrounded the winner as soon as his car had slowed down, lifted him shoulder high, and carried in triumph to M. Brasier, who duly embraced him, and presented him to the Minister for the Colonies, M. Clementel, while the band played the "Marseillaise," and the crowd shouted "Vive la France!" "Vive Théry!" "Vive M. Brasier!" and "Vive!"—everything else. Doubtless Théry, at any rate, was thankful that the weather had become cooler and somewhat showery!

Englishmen will be certainly encouraged by the creditable performance of the British team, as all three cars completed the course within the minimum time.

This is a testimonial to English car-building. Never before has an English team done as well in the Gordon-Bennett race. It is true that the cars were not highly placed, obtaining but 8th, 9th, and 11th places. But of the other competing countries France was the only one whose representatives *all* got home and placed. This means, as far as can be judged, that the only difference between the English and the French teams was a matter of familiarity with the course. And to really learn the course the English competitors had next to no opportunity, while the Frenchmen have been riding round the course—probably the trickiest course on which a race has ever been run—with the regularity of the tides for months and months. Had they enjoyed the same facilities for becoming familiar with the circuit they would have run France very close indeed.

MARINE GAS ENGINES.—PART II.

THE "CAPITAINE" SUCTION-PRODUCER.

Producer Gas Plants.

A GAS producer primarily differs from the ordinary fire-place in being enclosed in such a way that the necessary air for combustion can only enter from beneath. Only so much air as is actually required is admitted, and no air can find its way unconsumed through the fuel. The fuel, instead of being coke, is usually anthracite—a non-bituminous substitute—but were it not for the difficulty of extracting the tar and clearing the gas, practically any kind of coal could be used.

The action of the earliest producers was as follows:—The air, in passing through the red-hot anthracite, had its oxygen absorbed by the carbon (liberated from the fuel) to form carbonic acid gas (CO_2), and this gas, in passing upwards through other layers, absorbed more carbon, and became converted into carbon monoxide (CO)—the gas then used.

The manufacture of producer gas in the way described is, although simple, very inefficient, because, of the total volume of gas taken from the producer, no less than 66 per cent. is nitrogen—the non-combustible constituent of the air—and is, therefore, useless. It was also found that a considerable amount of the fuel was wasted in raising the temperature of the producer, and of the gas generated, in it to a needless extent, no less than 30 per cent. of the available energy in the coal being unavoidably expended in this way.

"Water" Gas.

The next step in the development of such an apparatus naturally consisted in attempts, not only to eliminate the useless nitrogen, but to overcome the heat losses above referred to, and, as a result, the gas plant, which produces what is now known as water-gas, was evoked. The main difference between it and the earlier apparatus was the substitution of steam for air. The anthracite was first made incandescent by a current of air—the resultant gas not being used—and a jet of steam was then passed through the hot fuel. The steam is thus decomposed, and the oxygen in the steam combines with the carbon to form carbon monoxide (CO), while the hydrogen, which is merely liberated, comes off with it. Both these gases are suitable for use in an engine, and

therefore, this form of producer has much to commend it. The reaction in the producer, however, is such that more heat is required for decomposing the steam than is evolved by the combustion of the anthracite to form carbon monoxide. The fire, therefore, goes out if steam alone is used, and the steam has to be turned off at intervals, and the fuel again raised to incandescence by a fresh supply of air. The

disadvantages of such an intermittent action were hardly to be overcome, even by the use of two or more producers to form a complete plant, and the latest form of producer is a compromise between the two systems. In the action of a present day producer, there is a constant supply both of air and steam. The reactions in this form of producer will be clear in the light of those which took place in the two previous cases. In the first case, there was too much heat, in the second there was too little, whereas now it is possible, by regulating the proportion of air and steam, to ensure that the producer shall be working under very efficient conditions. The resultant gas—inseparably connected with the name of Mr. Dowson—is theoretically composed of about 39 per cent. of carbon monoxide, 16 per cent. of hydrogen, and 45 per cent. of nitrogen, though it varies considerably, and contains other constituents.

Suction Producers.

The original methods for obtaining Dowson gas entailed the use of a separate boiler for supplying the steam, some form of fan for supplying the air under pres-

sure, and also a more or less large reservoir for storing the gas produced—altogether a very roomy plant. In 1888, however, M. Bénier introduced a form of producer in which the suction of the engine was used to cause sufficient air to pass through the fuel, and the boiler formed an actual part of the producer. Thus, instead of three independent elements, there became only one, and that a comparatively compact apparatus. This was not the only advantage, however, for a suction producer plant required no reservoir in which to store the gas. Directly the engine stops, the production of gas stops too. This is a particularly important point, for safety, because carbon monoxide is very poisonous, but is odourless.

THE 1905 DE DIETRICH CARS.—PART II.

The Frame, Axles, and Wheels.

REFERRING more especially to Figs. 1, 2, and 3, the main-frame is formed of pressed nickel steel with tapering side-members that curve inwards just behind the dashboard, so as to allow the front wheels to have a wide steering lock. There are two main intermediate cross-members, S^1 , which are formed by tubes, and these serve to support the gear-box. There are also other cross-tubes for supporting the petrol-tank, A, and for carrying the three pedals (L, P, and K^2). The frame is, as usual, mounted on semi-elliptic side-springs, those at the back—which lie outside the frame—being no less than 4 ft. 6 ins. long. The substantial forgings that form the axles have an \mathbf{I} cross-section, and the back-axle is connected with the frame by unusually deep pressed-steel radius-rods; the front axle has its forked steering-heads formed on the stub-axles. The road-wheels all

The Engine.

A single casting forms each pair of cylinders, and is so shaped that the inlet-valves fit down into place above the pistons. The valves lie, however, to the right of the centre, and they are held down by the induction-pipe-fittings, C, to which the induction-pipes, C^1 , are bolted. There is nothing unusual about the arrangement of the exhaust-valves, for the stems of these project downward through their valve-chambers, and have easily removable inspection covers, B^2 , above them; they are on the left side, and are operated direct from the main cam-shaft. Between the inspection-plugs, B^2 , and the induction-pipe-fittings, C, are compression-cocks, H^7 , that allow paraffin to be introduced for cleaning the pistons, and, fitting at an angle through the cylinder walls, on the right side, are the low-tension igniters, D. Beneath the rearmost exhaust-valve-chamber, is the pressure-valve, B^7 , that

A 16-h.p. De Dietrich Landaulette.

run on ball-bearings, and the cross rod that connects the two steering-heads together lies behind the front axle.

The engine is fixed direct to the main frame by six feet that project from the aluminium base-casting, and this casting has the steering-pillar bolted direct to it. In front of the engine, a honeycomb radiator is mounted, so that it forms the front of the bonnet, and the air is drawn through it by a belt-driven fan, as well as by the fan blades in the flywheel. The petrol tank, A, is held in place at the back of the frame by three straps, and it can, therefore, in case of accident, be easily removed for repair. The exhaust-box, B, is fixed across the frame just in front of the back axle, there is a large shield that extends from the front of the car beneath the engine up to the gear-box, and the pressure tank, H, in which the lubricating oil is carried, is fixed outside the frame on the "near" side.

causes the exhaust gases from that cylinder to maintain the required pressure in the petrol and oil tanks.

The inlet-valves, C^3 , which are operated from the same shaft as the exhaust valves, can be easily removed by taking off the three nuts that hold the fitting, C, down in place, and by slackening the two nuts that fix the induction pipe, C^1 , to it. The casting, C, together with the pivoted levers, C^2 , is then free, and either valve, C^3 , can be withdrawn. The levers, C^2 , do not act direct upon the valve spindles, but intermediate spring-plungers, C^2 , are introduced between these parts, and another feature is that the outer ends of the levers, C^2 , merely rest down upon the ends of the push-rods, C^1 , while the necessary adjustment for "setting" the valves is provided by short, hardened steel screws that pass through the levers.

(To be continued.)

Figs. 6 and 7.—Front view, and view from the left side, of the 24-h.p. De Dietrich Engine. In Fig. 6, the belt-driven fan and the chain-driven pump are specially prominent. In Fig. 7, one of the inspection-doors has been removed from the crank-chamber.

Figs. 8 and 9.—Views from the rear and from the right side of the 24-h.p. De Dietrich Engine. In the former, are seen the fan flywheel, the pressure-valve and a portion of the carburettor, and, in the latter, the igniters with their operating mechanisms are well in evidence.

Figs. 10 and 11.—The 24-h.p. De Dietrich Engine. In Fig. 10 is seen one of the cylinder-castings, with the induction-pipe-fitting (C) and the inlet-valves (C⁵) detached from it, and in Fig. 11, the complete engine is shown from above.

THE NEW MICHELIN TYRE FOR THE GORDON-BENNETT RACE.

TYRES play such an important part in any race, and especially in the Gordon-Bennett Race, that a special interest is attached to the new tyre which Messrs. Michelin introduced primarily for this event this year. The tread of the tyre is of leather, and is steel-studded like an ordinary non-skid band, but the leather, instead of being superimposed, is let into, and vulcanised solid with, the actual rubber of the tyre, and the inner ends of the steel rivets are embedded in the fabric lining.

The relative depth of the leather is shown in the accompanying sectional drawing, which also makes clear the manner in which it is dove-tailed into the rubber. The idea has been to construct a tyre as a complete unit, which shall approximate very closely to the plain pneumatic in its obstacle-absorbing properties, while at the same time giving the obvious advantage of a steel-studded tread as regards adhesive power and reduced chances of puncture. Were it possible to successfully mount the studs directly on the rubber itself, this would probably have been done; unfortunately this is not possible, and it is therefore necessary to resort to leather as the most flexible material which possesses the requisite tenacity to withstand the tearing strain.

Completely encasing the rubber of the tyre with an external leather covering, has hitherto been the general

practice, but the bad radiating qualities of this material have to be taken into account when the conditions are

such as to make the tyres very hot. Naturally enough, the difficulties of successfully constructing such a tyre as that we have described are extremely great, and it may be taken for granted that Messrs. Michelin have not advocated its use without the assurance of its good qualities based on extended tests. If these tyres prove entirely successful on racing cars, we understand that they are to be put on the market for touring cars in the near future.

Cross-section of the new Michelin tyre, used in the Gordon-Bennett Race. A, fabric; B, rubber cover; C, leather tread; D, steel rivets.

SIR BOVERTON REDWOOD.

EVERY automobilist, and everyone who has taken any interest in the development of that great industry which has rendered automobilism a possibility—the recovery and refinement of petroleum—will be glad to find Dr. Boverton Redwood's name among the recipients of birthday honours, a knighthood having been conferred on him for his great services in petroleum development, and for the able advice which he has always been ready to tender to the various Government Departments, and particularly the Home Office. There are few who have received a recognition of the Royal favour more thoroughly deserved, and we tender to Sir Boverton Redwood our heartiest congratulations.

Wire Wheels for Motor Cars.—The results of some interesting experiments with wire and wooden wheels have been sent to us by Mr. S. F. Edge, and these appear to show that, so far as lateral strength is concerned, the former have a distinct advantage. The wheels were fixed in such a way that a pull could be applied to the tread of the tyre, the force being exerted in a direction parallel to the axle. An exceptionally well-made wooden wheel stood a pull of 1,733 lbs. before a slight crack developed in one of the spokes, this becoming more serious as the pull was gradually increased to 1,806 lbs. This was a dished wheel, and the pull was exerted in the opposite direction to the dishing, as it would be on the outside wheel of a car when turning a sharp corner. From 422 lbs. pull up to 1,733 lbs. the temporary set varied from .18 ins. to .192 ins., and the permanent set, after the test had been made, was .26 ins. Subsequently, at a pull of 1,840 lbs., two more spokes cracked. A symmetrical wire wheel, weighing 27½ lbs. as against 29 lbs., stood a pull of 2,025 lbs., and it was estimated that the strength of a dished wire wheel would enable it to stand a pull of 2,400 lbs. As Mr. Edge

points out, wooden wheels have a more pleasing appearance, and are easier to keep clean, than wire wheels; but, on the other hand, wire wheels are probably more durable, and are certainly easier to repair, than wooden wheels. To still further test the relative merits of wire wheels, he is now having a set fitted to his own touring car. The 6-cylinder Napier racer was, it will be remembered, also fitted with them in the recent eliminating trials in the Isle of Man.

Speed—and its estimation.—There is little wonder that so many cars are now seen fitted with speed indicators, for they only need to be tried once in order to demonstrate not only their utility, but even their fascination. Motorists, as well as other people, are in the habit of flattering themselves that they are accurate judges of speed, but their judgment is seldom more than approximately correct, for the effects produced by varying rates of travel are not proportional. We have recently had our attention—in connection with some tests which we have been carrying out—forcibly drawn to this very point, and we soon found the necessity of relying entirely on the instrument, for, even after a whole day's run on one particular car, it was impossible to depend on one's personal sense of speed—so great an effect have the varying surroundings when the car is travelling.

It is especially remarkable how deceptive speed becomes as soon as what might be called the "critical" rate for any given car is reached, for the impression then produced by a slight increase is grossly exaggerated. In our special articles dealing with these instruments we have also several times emphasised the importance of an open scale over the whole range of the dial, and this matter has been given particular attention by Messrs. Smith and Sons—whose instrument we so successfully employed on this occasion; their triple spring device, which gives this advantage, was well shown in our issue of April 1st this year.

Miles : Kilometres.—This Scale enables distances up to 4 miles to be compared in the English and French units of measurement ; and is especially suitable for short, high-speed races. Each division above the line represents 1/4 mile (110 yards). Each division below the line represents 0.1 kilometre.

Any car can win a cup like this.

It takes an ARROL JOHNSTON to win the Glasgow Cup.

WHY are the ARROL JOHNSTON Cars, Vans, and Lorries the most economical?

BE

of their efficient motors.
of their efficient transmission.
of their efficient form of governing.
of their solid tyres.

They do not use an Automatic Carburettor

HOW

was this proved?

25 British and 19 Foreign Cars were entered for the Scottish Reliability Trials. The ARROL JOHNSTON Car ran 43.8 ton miles per gallon of petrol and won the GLASGOW CUP. The next best car ran only 35.37 ton miles per gallon.

We will be delighted to send Catalogues and full particulars on receipt of a post-card.

A few shop-soiled 6 seated 12 h.p. Cars going at £400 each.

CAUSE AND EFFECT.

BEFORE THE ORDER

MOTOR CARS IN HYDE PARK.

THE question of the exclusion of motor vehicles from Hyde Park "during Society hours" came up for discussion in the House of Lords on Tuesday, the Earl of Rosslyn having asked—

1. At whose suggestion, by what authority, or by whose initiative Hyde Park has been closed to motors and electric cars?
2. On what grounds the order has been issued?
3. Whether the order is aimed at any particular section of society, and, if not, whether electric carriages may not again be allowed by His Majesty's Government to enter the park during the hours at present forbidden to them?

To these questions Lord Windsor, as First Commissioner of Works, made the following reply:—

In the first place, the noble earl has asked me three specific questions. With his permission, I will answer the first question as it stands on the paper, and I will say that it was at my suggestion, on my authority, and on my initiative that motor cars were excluded from the park during certain hours. The second question is, On what grounds the order was issued? and my answer to that is that great inconvenience was felt by those using Hyde Park for various purposes in consequence of the noise, and the dust, and the danger, and the smell of motor cars, and in the interests of the large majority of persons using the parks it was thought desirable to impose certain restrictions on motor cars in the most crowded hours of summer afternoons. I regret that I do not see my way to any alteration in the rule as it now stands, or to discrimination between electric and other motor carriages. Then I come to the rule under which this authority has been exercised. That rule is No. 1 of the rules which were framed under the Parks Regulations Act of 1872, and amended on April 28th of last year. This first rule begins by saying that no stage coach, omnibus, &c., shall be allowed to enter the park. Then it comes to cycles and motor carriages:

Cycles, whether mechanically propelled or otherwise, and carriages and cars propelled or drawn by mechanical means, shall only be admitted subject to such regulations as shall from time to time be framed by the Commissioner of Works. That rule was laid on the table of the Houses of Parliament for a month, and under that rule regulations have been made. I may remind the House that a case was brought in the Courts of Law the other day to decide this very point—the legality of this regulation under the rule. The magistrate allowed a case to be stated for the higher court, and the Lord Chief Justice gave judgment, two other judges concurring, that it was absolutely legal. I have seen various comments on the meaning of these regulations, and it has been suggested that this was likely to be the beginning of a series of persecutions on the part of the Office of Works of motor cars, and that it might be followed by other more serious restrictions in various other parts of the parks. All that I can say is that nothing could be more ludicrously far from my intention. The crux of the question lies in whether discrimination can properly be made

AND AFTER.

between different kinds of motor cars. I readily admit that the hardship of such a regulation is felt by those who have disposed of their carriage-horses and carriages, and who only have an electric brougham. But the difficulty of discrimination is greater than it seems to anyone who looks upon it merely at first glance. I have had to go into this very carefully, and to consult the Chief Commissioner of Police on the question, and I am unable to convince myself that it is a proper thing to put upon the police and park-keepers a discrimination which, although I am told it may very easily be made in nine cases out of ten, yet would in the tenth case give rise to considerable difficulty. It would impose on them a responsibility which I should hesitate to advise should be imposed. As far as I myself am concerned, I have the keenest interest in motors, and hope to see them developed as rapidly as possible in this country and put to the best possible uses, but to say, as an Hon. Member of the House of Commons wrote to the papers, that the motor industry in Coventry is likely to be seriously imperilled if, during three hours of the day for three months of the year, electric landaulettes and carriages are excluded from Hyde Park, seems to me a statement so lacking in the sense of proportion that it scarcely needs to be taken seriously. I can only say that the whole question has been very seriously considered. This regulation, for which I am solely responsible, has been passed in the interests of the large majority of the persons using the parks, and if the public in general think I have done wrong it is I alone who am to blame.

MR. SCOTT MONTAGU asked various questions regarding the parks regulations and rules, in the course of replies to which Lord Balcarras stated that rules had to be laid before Parliament though regulations made under those rules need not be. Though this statement excited laughter, it is, of course, in strict conformity with the Lord Chief Justice's decision. In reply to Mr. Bowles, Lord Balcarras stated that he did *not* rely on the Lord Chief Justice's judgment in interpreting the Act, though why he should have said so is not clear, as the Lord Justice's decision is now a "ruling."

In the House of Lords on Monday last, Earl Russell called attention to the fact that in the town of Beverley, the Local Government Board had imposed a speed-limit on automobiles of five miles an hour, and he asked whether the Local Government Board had taken the advice of the Law Officers as to their power to impose varying speed-limits under Section 8 of the Act. Lord Kenyon, in reply, stated that the Board had not thought it necessary to consult their Law Officers as to the interpretation of the particular clause of the Act referred to.

THE ROYAL AGRICULTURAL SHOW.

THE sixty-sixth annual exhibition of the Royal Agricultural Society of England was held for the third year in succession at the Society's own show-yard at Park Royal. Misfortune has unhappily marred this attempt on the part of the premier representative body of our agriculturists to settle down in life after it had attained the respectable middle-age of three score years and three, and this latest show has been even more unsuccessful from the gate-money point of view than the two which preceded it.

From a motorist's point of view, perhaps, the show at its best contains but little of interest, although the application of the internal combustion engine to the operation of farm machinery must appeal to an enormously larger class, many of whom own, or will own, motor cars for pleasure purposes. One of the features which often characterises the introduction of self-propelled machinery into any new field is a disregard for sound construction of detail, and it is not altogether wonderful, therefore, that some of the exhibitors are not subsequently represented after their first essay. It is only necessary to look at the thoroughly high-class workmanship of the best portable and traction engines, such as those shown by Fowler, Aveling and Porter, Garrett, Marshall, Wallis and Stevens, Forster, and others, to appreciate the fact that properly-made machinery is essential in all cases where it is required to do heavy work of this class.

There never have been very many firms to take up the subject of the lighter forms of self-propelled agricultural machinery, and, roughly speaking, the Ivel agricultural motor has been unrivalled in this department (which is most suitable for the application of the petrol motor), although there have been from time to time other firms who have attempted to get the same results (see *THE AUTOMOTOR JOURNAL*, July 26th, 1902, and April 25th, 1903) with more or less inferior machinery. It is really extraordinary that some other makers—preferably those with a reputation to lose—do not seriously take up this work, because, unless agriculture in England is past revival, it would appear, from such comparisons as are available, that the general employment of self-propelled ploughs, cutters, binders, &c., would give a much-desired stimulus to the industry, even if only from the point of view of time saved and consequent greater independence of the weather.

This year, the Ivel machine has been adapted to use paraffin, Mr. Dan Albone, the inventor, having found that this engine works quite well on this fuel if a simple vaporiser is introduced into the induction-pipe. Vaporisers have the disadvantage of requiring external heat when starting, but this is perhaps a small matter on a farm, and there is the alternative—though less desirable—of starting cold on petrol while the exhaust gases from the engine have supplied the necessary heat.

Another self-propelled agricultural machine was that which is known as the "Universal," constructed by Sanderson and Co. The model shown was fitted with a very large 30-h.p. twin-cylinder vertical engine using paraffin as fuel. The engine is placed longitudinally in the frame, and the front end of the crank-shaft terminates in a pulley for general utility purposes. The differential countershaft has universal joints at each end, and the front wheels are driven directly from it through spur-gearing. The paraffin attachment is at present subject to patent formalities, and full particulars are therefore not yet available, but we understand that the paraffin is led directly to the perforated seat of the automatic inlet-valve. Petrol is necessary for the purposes of starting.

The advantages of motor lawn mowers have always been sufficiently obvious, and the best-known makers of lawn mowing machines have long been in a position to supply the self-propelled mowers from stock. Messrs. Green and Messrs. Ransome, Simms and Jeffreys were represented at the Show, a "thirty-inch" and a "forty-inch" being the largest models shown respectively by the two firms. The 40-in. "Green" model has a twin-cylinder engine which is fitted with high-tension magneto and also battery ignition. An epicyclic gear is employed in lieu of an ordinary main clutch, and is operated by a hand wheel. The propelling roller is chain-driven, and so is the cutter, but by an independent chain, which may be thrown in or out of gear by means of a jaw-clutch.

We have not previously seen the application of motor propulsion to lawn rollers, but Messrs. Banford and Perkins have now put such a machine on the market. The roller is water ballasted up to 3½ tons total weight, although larger sizes are also constructed. The water tank naturally dispenses with a radiator, although this is not exactly the type of machine on which details need be eliminated on the score of saving weight. The single-cylinder Simms engine is placed longitudinally in the frame, and drives a longitudinal shaft beneath it by spur gearing. This longitudinal shaft drives a transverse countershaft, and from one end of this countershaft a single chain passes to a chain-wheel on the rear roller. Two speeds are available, viz., 1 and 3 m.p.h., and steering is accomplished on the traction engine principle by chains.

Although steam traction engines predominate, the self-propelled lorry again takes an important place among the heavy vehicle section, those represented this year being Messrs. Mann, Beaufort, St. Pancras Engineering Company, and Allchin. The last-mentioned firm exhibit this class of vehicle for the first time, their previous experience having been derived with traction-engines.

Several firms exhibited portable petrol-engine plants for general utility work on estates, and among these mention may be made of Messrs. Merryweather's pumping machinery and estate fire engines, all of which have been dealt with from time to time by us.

It is, perhaps, not altogether fair to speculate on the possibilities of a next year's Show at Park Royal, but the serious condition of affairs renders it extremely problematical, to say the least. Perhaps the principal advantage of holding the Show in London at all is the comparatively large export trade which the exhibitors are enabled to obtain from foreign agents in the metropolis. This has, however, no financial value to the Society, who are more concerned with the quantity than the quality of the visitors. If the Show should cease, we can only remind those who have hitherto regarded it as their only Show, that the automobile world has shows of its own at which agricultural motor machinery could undoubtedly be exhibited to advantage.

The Ten-Mile Park Limit.—The sequel to the judgment of the Lord Chief Justice regarding the order of the First Commissioner of Works limiting the speed of motor vehicles in the parks to ten miles an hour was played out last week. Our readers will call to mind that quite a large number of summonses were issued against automobilists for exceeding the ten miles limit. An appeal to the Divisional Court was taken in one of these cases—the one which the Lord Chief Justice and two other judges decided adversely the other day—the others being allowed to stand over until the Divisional Court's decision. These were accordingly brought up before Mr. Plowden, and he decided to fine all the offenders 20s. and costs in all cases in which the speed was below 20 miles an hour though above ten—a very sensible and equitable decision. Mr. Staplee Firth, who appeared for most of the defendants, then raised the question of the endorsement of the licences. The learned magistrate said that the peculiar, he evidently seemed to think the ridiculous, wording of that particular section of the Act, gave him no choice in the matter, and that he was bound to insist on the endorsement, but he stated that he sympathised with the victims who had to suffer the endorsement, and expressed the opinion that the onus placed upon the magistrates of compelling such endorsements by the Act of 1903 was incomprehensible, and added that the endorsement of the licence for such offences was so ridiculous that if he were a motorist himself he would not care personally if his licence was full of endorsements.

THE proposal of Mr. Timothy Davies to apply to the Local Government Board to limit the speed of motor cars in the metropolis to ten miles an hour, came before the London County Council at its meeting on Tuesday. It met with no success, being contemptuously overridden by a motion to proceed to the next business of the day, which was carried by a large majority.

IN the House of Commons on Monday, Mr. Wason asked the Secretary of the Local Government Board if he would consider the expediency of empowering magistrates to impound offending motor cars for a period up to six months where breaches of the law had been committed. To this Mr. G. Balfour replied that the matter would be considered during the enquiry which it is proposed to institute into the working of the Motor Car Acts, which he said would be held this year.

AERONAUTICS.

As shortly chronicled by us last week, the Lebaudy airship has had a record trial, keeping longer in the air than ever before—3 hours and 11 minutes in all, and circling to and fro between Moisson and Freneuse, and repeatedly rounding the clock tower of the latter townlet, and returning to its starting place again a number of times. These evolutions were carried out with the wind blowing 8 miles an hour, and the great airship obtained a velocity of 42 kiloms. per hour with the wind, and 18 kiloms. against it. That is to say, her average speed through the air was 30 kiloms., or approximately 19 miles per hour. That an airship of this type succeeded regularly in accomplishing a speed of 11 miles an hour against an 8-mile wind, is a practical triumph of which there is no gainsaying the importance. So great is it indeed that it has been determined, as soon as the weather is favourable, to take the airship on a protracted tour through France, visiting the camp of Chalons to take part in the Military Manœuvres, and bringing her back again to her home at Moisson. Everyone interested in the progress of aeronautics will heartily wish the great undertaking every possible practical success, and will fervently pray that it may not be marred at the last moment by an accident like that which occurred about a year ago at Meudon.

THIS fine exploit has been rapidly followed by another. Starting from Moisson on Monday, it was determined to attempt steering the airship to a given point at a considerable distance, the spot selected being Meaux, which is almost in a straight line between Moisson and Chalons, and is 95 kiloms. distant from Moisson. The airship went straight as an arrow to Meaux, with the exception of a slight detour from the straight line made when passing over the Montmorency Forts to the north of Paris. The point selected for descending upon was the officers' race course at Meaux, and thither a number of men in the employ of M. Lebaudy had been dispatched to arrange for the descent. The airship ultimately alighted on the exact pre-arranged spot near the men who were waiting for it, the successful termination of its journey being witnessed by M. Pierre Lebaudy and M. Juillot, the engineer of the airship. The experiment was carried out under the supervision of Captain Voyer, who had been specially detailed by the War Office to thoroughly test the capabilities of the airship, and who made the journey on board her.

THE time actually occupied in covering the distance of 94 kilometres as the crow flies—it was probably as generally estimated quite 100 for the airship—was 2h. 35m., which, considering the wind was against it (though not blowing strongly), was a very fine performance indeed. Needless to say, the whole of Meaux turned out to see the airship when tethered to its mooring ground by a perfect network of ropes and cables, and guarded by a troupe of chasseurs.

THE airship at once commenced to take in supplies of gas and petrol, and at 3 o'clock on the following morning continued its journey towards Chalons in the teeth of the easterly wind, which had developed in force to such an extent that the airship could only proceed against it at about 8 miles an hour, from which we may conclude

that it was contending with at least a 10-mile wind. It beat against it triumphantly, however, and was finally brought to anchor over the Market Place of the little town of Ferté.

ALMOST contemporaneously, the veteran navigable balloonist, Count Zeppelin, has made another ascent with his great aluminium airship on the Lake of Constance. Count Zeppelin spent practically the whole of his private fortune on the manufacture of his first airship. This latter model, which has cost 200,000 francs, and has been built at the cost of a fund, to which the German Emperor, the King of Wurtemberg, and a number of other prominent personages have contributed, is of the same type as the first Zeppelin airship, but is provided with a more powerful motor, the present motor developing 80-h.p. It appears to answer well to the helm, and is thoroughly manœuvrable, but so far it has developed but a comparatively insignificant speed, and one certainly not sufficient to enable it to contend with the mildest of breezes.

MORE sensational experiments have been carried out by Professor Montgomery in America. He has designed a very practical form of aeroplane which resembles in general structure two huge curved wings designed to advance through the air, one might say like a bird with outstretched wings, flying sideways, a directing tail which is, roughly speaking, of semi-circular shape, being placed at the side of what would appear to be the span of the wings. The stability of this machine in the air is very marked indeed, and a most sensational experiment demonstrating this fact was recently carried out. Attached to a hot air balloon, and mounted by a skilled aeronaut and parachutist, the aeroplane was taken up to a height of some 4,000 feet, when it was cut loose from the balloon, and made a tremendous dive earthward. Soon, however, like the Alvares aeroplane in similar circumstances, it attained equilibrium and glided slowly in curving flight to the ground, the aeronaut succeeding in alighting at the very spot which he had previously determined to come down on. The capacity of this machine therefore for sustaining a man has certainly been demonstrated, the aeronaut in this experiment weighing 156 lbs., while the total weight of the aeroplane was only 42 lbs. Whether it will be capable of rising from the ground and of accomplishing motor-driven flight further experiments of course only can decide.

THERE is also progress to be chronicled in design and experimentation with other machines of the aeroplane type. Notable amongst these are a number of tests made on the Seine with a new machine designed by M. Archdeacon, which may be described roughly as resembling the former or Wright type of aeroplane with a similar arrangement tacked on at some distance behind, the whole machine, therefore, being very like an enormous box-kite. It is adapted to float on the surface of the water and has been experimented with by being raised into the air by means of a motor boat, La Rapiere, to which it was connected by a hawser. M. Voisin, as before, mounted the aeroplane, and conducted the manœuvres, but so far they have not been very remarkable or epoch-making.

RACES, RECORDS, AND TRIALS.

Some of the cars outside the Maynard Arms Hotel after the day's work.

A group of enthusiastic supporters of the Sheffield Club who took part in the day's sport.

SHEFFIELD AUTOMOBILE CLUB, PADLEY WOOD HILL-CLIMB.

Padley Wood Hill-Climb.—At Sheffield, last Saturday, the rain fell so unrelentingly during the whole morning and a great part of the afternoon that only nine competing cars put in an appearance at Padley Wood Hill, and none of the motor cycles were able to take part in the contest this year. The Sheffield and District Automobile Club made a new departure in connection with this annual event by excluding from Classes 1 and 2 all vehicles and cycles, respectively, used for trade purposes or dealt in by members in the trade, and instituting separate classes (3 and 4) for them. As events turned out, eight of the 29 entries in Class 1 competed, and none of the five cycles entered in Class 2 ran, while it was a "walk-over" for the solitary representative (a 14-h.p. Hallamshire) in Class 3, since the other car in that class failed to appear; this car's time was 9m. 26s., and its marks total 978.

Needless to say, the road up this exceptionally long and stiff, but extremely beautiful, hill was very heavy and very slippery, so that none of the cars were able to do thorough justice to themselves. The weather, too, had naturally a somewhat depressing effect upon intended spectators, though a fair sprinkling of enthusiasts had travelled out by train from Sheffield, and a few local people had assembled. The following table gives the times made by the various cars, as also the marks accorded them, these marks having been arrived at by the same formulæ that were employed by the A.C.G.B.I. in the 1903 Reliability Trials. Mr. F. Churchill becomes the holder of the Harvey Foster Cup for Class 1, and the other cup, presented by Mr. Harvey Foster for motor cycles, remains without a winner this year. After each car had completed the climb, carrying an official observer amongst its full complement of passengers, the majority of the officials, competitors and other members of the club met at the Maynard Arms for the usual friendly meal, during which time Mr. Cawood (hon. secretary) and Mr. Wade (recently hon. secretary *pro tem.*) were able to announce the nett times of each contestant.

Sheffield Hill-Climb. Table of Results, giving Times and Marks.

Owner.	Car.	Time.	Hill-Climb Marks.*	H.-P. shown by Performance.	Accuracy of Declared H.-P. Marks.*	Total Marks.

Dr. Pearson	6 "	14 40	564	2.3	37	601

* The formulæ employed in the 1903 Reliability Trials was used for obtaining these results, but resistance to traction was taken at 70 lbs. per ton instead of 35 lbs.

Brighton Motor Week.—The motor boat trials, which were originally announced to be held in connection with this meeting, have been abandoned, and an extra day will therefore be devoted to the Madeira Road Races. There is also to be an exhibition of automobiles in the Dome and Corn Exchange. Mr. Alderman Blaker, the Mayor, takes a very enthusiastic view of the event, and anticipates the arrival of about 3,000 cars, which should give a magnificent stimulus to the trade of this popular seaside resort.

THE Henry Edmund's Hill-Climbing Trophy, originally announced to take place on July 12th, has been postponed for the time being.

MR. WEBB JAY on his 15-h.p. White steam car on Monday last covered 5.56 miles at the Morris Park Race Track, New York, in 5m. 1s., his best time for the mile being 49½s.

Gordon-Bennett Cup, 1906.—Formal decision was taken, after we had gone to press last week, by the A.C. de France to the effect that the club would not participate in the Gordon-Bennett Race for 1906, whether they secured the Cup this year or not. In voting, 23 of the Sporting Committee were in favour of the club abandoning participation, and 14 in favour of continuing to take part, 6 blanks being recorded. The question of France participating the following year in the race was left in abeyance. This decision has been arrived at in consequence of the French Club maintaining that they should be entitled to have a larger number of French cars in the race in proportion to their larger trade than the other countries who are entitled to run for the Cup.

The Marquis De Dion's proposal of running a big reliability trial in its place over about 2,500 miles on the Continent under the circumstances will probably be put forward in a modified form, whilst no doubt an endeavour will be made to establish the Grand Prix of the Automobile Club de France, at the Aix les Bains Automobile Meeting of 1906, on such a basis as to take the important place now occupied by the Gordon-Bennett Race. In this Grand Prix, as it will be remembered, the idea is that France shall have a very much larger preponderance of cars than any other country—an arrangement which may or may not be to the advantage or disadvantage of France in the long run.

It is significant that at the same time as the announcement of the abstention of the French from the Gordon-Bennett Race next year, the committee of the German Automobile Club are arranging to organise a big international race next year in Germany of the same character as the existing Gordon-Bennett contest.

Herkomer Trophy and Bleichröder Race.—When entries closed last week for these events, 96 cars had been entered for the Herkomer Trophy. The motor bicycle race, which will be held at the same time, has brought in 50 entries, whilst for the Bleichröder race seven racing vehicles from 70 to 130-h.p. have made formal entry. In the Herkomer list of entries, beside Prince Henry of Prussia's 40-h.p. Benz car, and many

The Napier Racers.—"Selling Off."—We have received the startling information from Mr. S. F. Edge that the present well-known Napier racers are for sale, and can even be delivered to purchasers prior to the Brighton and the Blackpool meetings if desired. These cars include the 80-h.p. machine, driven by Mr. Cecil Edge, and that so successfully driven by Mr. Clifford Earp in the Eliminating Trials recently; the price of either is £800. Also for sale are Mr. John Hargreaves car, for which Mr. Hargreaves is asking £1,200; and the extremely fast 6-cylinder racer which has earned so great a reputation in the past, and was driven by Earp on Wednesday. The latter car is priced at £2,500.

One of two alternative explanations naturally suggest themselves either that Mr. Edge considers further participation in big racing events unprofitable, or that he sees his way to building cars which will have a much better chance of winning in the long-distance contests of the future. We learn from him that he holds the latter view. It is certainly characteristic of his usual policy to do a thing thoroughly if at all, even if it involves making a clean sweep, as in the present case.

powerful cars of the leading continental makers, are several British machines, including Mr. Edge's 50-h.p. Napier, a 35-h.p. Daimler, entered by Miss Maud Manville, a car of similar power by Mr. Edward Manville, and two more of the same type by Mr. Phillip Dawson and Mr. Percy Martin. Mr. Clarence Gray Dinsmore is represented by a 70-h.p. Mercedes, M. Paul Meyan, who has matched himself against Mr. Siddeley, by a 40-h.p. De Dietrich, and Mons. A. Dufaux by the 80-100-h.p. racer with which he had hoped to have made a mark in the Gordon-Bennett race on behalf of Switzerland.

Aix les Bains Tourist Trial.—The results in this event are announced as follows:—

Cat. 1.—1, Montaral (De Dion Bouton).

Cat. 2.—1, Perret (Peugeot); 2, Didier (De Dion Bouton); 3, Nieuport (Darracq).

Cat. 3.—1, Cormier (De Dion Bouton); 2, Cote (Pilain); 3, Huillier (Mors).

Cat. 4.—1, De Loys (La Buire); 2, Mottard (La Buire); 3, De Rothschild (Mercedès).

The special prize for teams is awarded to the De Dion Bouton Company.

Circuit des Ardennes (Belgium).—The entrance fee for the Ardennes Circuit has been fixed at 5,000 francs per vehicle up to July 15th. From that date until August 4th it will be 7,500 francs. In this fee is included the 100-franc tax of the Province of Luxemburg, imposed on each of the cars taking part.

By way of a reminder, the Ostend Automobile Week commences on Monday next, July 10th, when the kilometre speed tests will be run off, followed the next day by the 10 and 5 kilometre events for racers and tourist cars respectively, on the 12th by the Tourist Reliability Trial, and on the 13th the Standing Mile Speed Trials for racers and tourist cars is the attraction.

THE French Industrial Vehicle Trial promises to be of considerable importance, as already nearly 60 vehicles have been entered.

⊗ ⊗

When is a driver not a driver?—The London police are in a terrible quandary. Never have they had such a nut to crack before. To drive a motor car without a licence is, of course, as we all know, a seriously punishable offence. Nevertheless, a 24-h.p. Mors was driven all about London the other day by a driver who, there is not the slightest reason to suppose, has ever taken out a licence. Is the driver punishable or not? If he were human there would be no doubt about it; but the question is, is the driver human, and if he is not human, does the obligation to take out a licence apply, and if it is not complied with, is the omission punishable? These are some of the questions which the police are no doubt asking themselves apropos of the exploit of "Enigmarelle," the mechanical figure which daily appears at the Hippodrome. Accompanied by the inventor, he is stated last week to have walked down to the Mors garage in Shaftesbury Avenue, mounted a Mors car, and successfully driven it through Piccadilly, the Green Park, the Mall, Fleet Street, and the Embankment, a large crowd of people witnessing the performance at various points, and cheering enthusiastically.

THE ELECTRIC TRAMWAY AND RAILWAY EXHIBITION.

WE are glad to find that several of our British motor omnibus building companies, undaunted by the narrowness implied by the title given to this Exhibition, have on this occasion invaded the enemy's territory so far as to make a fair showing with their *non*-electrical, and *non*-tramway or railway, vehicles. It is, moreover, extremely significant that the promoters of the E. T. and R. Show should have found it advisable to include an illustration of a motor 'bus on the cover of their well-arranged and carefully-compiled catalogue, even though an ingenious attempt has been made in the preface to explain it away in these words :—

"Motor omnibuses ceased long since to be an alarming object to the tramway manager, who now recognises in them a useful ally, which will help to feed his lines, and run where, for special reasons, his tracks may not be laid. That the motor 'bus has a wide field of usefulness no one will be disposed to deny, but its limitations are such that no corporation or company need tremble for the security of its tramway investment where that has been made with reasonable care."

Apparently tramway men have *now*, at any rate, come to recognise that it is better to be on friendly terms with the very latest development of self-propelled traffic—a striking testimonial which needs no comment.

The exhibition, which opened last Monday and closes on Friday next (the 14th)—and is of an international

character—is the third that has been held, its predecessors having taken place in 1900 and 1902, respectively. As might be expected, it is not an event that is calculated to attract the general public as does an automobile show, and the Agricultural Hall is by no means filled to overflowing, either with exhibits or spectators. For motorists there are the motor 'buses and other commercial vehicles, there is an electric racing car—with an enormous bonnet full of accumulators, and the motors stowed away in the hubs of the front wheels—and there are an assortment of speed indicators, amongst which the Elliot motormeter is prominent. The Wolseley Company exhibit a double-decked 'bus which has already run about 7,000 miles in regular service in Birmingham, and they also have a single-decker outside the building for giving trial runs. Double-deckers are also shown by Messrs. Straker and Squire and by the Motor Car Emporium, while the latter firm stage a char-a-banc and a couple of petrol luries as well. Another char-a-banc is exhibited by Messrs. Durham, Churchill and Co., and Messrs. Blackwell and Co. have a petrol-driven trolley-ladder on their stall. The world-famed Vacuum Oil Company are, of course, well to the fore, as usual, while the important European firm, the Stern-Sonneborn Oil Company, show samples of their special lubricants.

LADIES' AUTOMOBILE CLUB GYMKHANA AT RANELAGH.

CLUBS AND ASSOCIATIONS.

A group of cars of the members of the North-East Lancashire Automobile Club at Mr. Fred Hodgkinson's residence, Higher Feniscloes Hall, Pleasington.

Aero Club.—Two balloons will be dispatched by the club at the Beckenham Flower Show on July 12th, and one balloon is to ascend at the Liverpool Polo Club Ground at Liverpool, on Saturday, July 15th, on the occasion of the Liverpool A.C. Motor Gymkhana.

The Automobile Association.—A meeting was held at the Trocadero on Thursday afternoon, the 29th June, for the purpose of forming an association of motor road users.

Mr. Charles Temperley was in the chair, and explained that the meeting had been called in consequence of another meeting previously held, when the question of forming the association was decided. He explained that the new association would have as its objects the protection and advancement of the legitimate interests of motorists, and in particular to assist in the enforcement of the laws affecting all users of the highway. He explained that the association would combat in every form restrictions on the fair use of the public road by motorists.

Mr. Charles Jarrott spoke in support of the formation of the association, and said that already a considerable number of gentlemen had joined. He believed that the only way to secure fair treatment was to fight for it, and fight hard, and give nothing away. It was intended that the new association should have a strong legal department for the assistance of its members, and that an active policy should be undertaken to see that not only were the laws affecting motor cars fairly enforced, but that other laws relative to the use of the highway by other vehicles should be enforced in a similar manner. He saw no reason why the membership of the association should not run into thousands, and as the subscription had been fixed at a very small amount, a very large number would be able to join who—by the subscription alone—are debarred from joining any of the existing clubs.

Mr. Walter Gibbons strongly supported the formation of the association, and stated that the rank injustice done to motorists at the present time called for unity between all automobile road-users. Unfair prejudice had been created against motorists, and an association was a great necessity.

Lieut.-Col. Mark Mayhew, Sir Archibald McDonald, and Col. Bosworth all strongly supported the formation of the association as fulfilling a big want.

Mr. S. F. Edge stated that he cordially supported the suggestion, and that the only way of securing proper treatment from the hands of the authorities was to see that the law was administered to everyone impartially, and that it was necessary for all automobilists now to make a bold fight, instead of the policy adopted up to the present of taking everything "lying down."

Further supporters in the names of:—Mr. Thring Robertson, Mr. H. S. A. Smith, Mr. Schlentheim, and Mr. C. W. Brown spoke in further support, and nearly all those present signed application forms for membership, and joined the association.

The chairman explained that the subscription to the association was 2 guineas, and that application forms and particulars could be obtained from Mr. E. A. Bowden, hon. sec., 45, Great Marlborough Street, W.

It was arranged that a general meeting of the members of the association, for the purpose of electing a working committee and appointment of officers, should be called for Monday, the 10th of July, at 5.30 in the afternoon, at the Trocadero Restaurant, and he hoped that they would persuade their friends to attend that meeting, and join the association. He also gave a general invitation to all automobilists to attend and enrol their names as members.

Berkshire A.C.—Members of the club lunched together at the small Town Hall, Reading, on Saturday last, when the chairman of the club, Major E. R. Portal, presided over a gathering numbering about one hundred, including many ladies. Field-Marshal Earl Roberts, K.G., K.P., V.C., president of the club, who was accompanied by Lady Aileen Roberts, was present. Earl Roberts, on his arrival, was received by the chairman, Lieut.-Col. W. Waring (hon. sec.), and the members of committee. Amongst those present were Mrs. W. Waring, Miss Melloney Waring, Mrs. E. R. Portal, Mrs. J. W. Ouvry, Mrs. Geo. Alston, Mrs. J. F. Ochs, Mrs. Walter L. Bourke, the Marquis of Downshire, Capt. and Mrs. Kenneth Campbell, Capt. and Mrs. E. F. Rhodes, Mr. and Mrs. Emile Garcke, Dr. and Mrs. J. Hopkins Walters, Mr. Oscar S. Thompson, Miss Muriel Thompson, Col. and Mrs. Fielden, Mr. and Mrs. E. S. Gooch, Mr. and Mrs. George Tydd and the Misses Tydd, Mr. and Mrs. Chas. H. Dodd, Mr. and Miss Vanderstegen, Mr. and Mrs. Stuart A. Ord Mackenzie, Mr. and Mrs. A. Kadford, Dr. and Mrs. John Phillips, Mr., Mrs. and Miss D. D. Coath, Mr. and Mrs. W. A. Farmer, Mr. and Mrs. W. St. Quentin Leng, Mr. and Mrs. R. Hughes, Mr. and Mrs. W. B. Secretan, General and Mrs. Waddington, Miss Lowain, Miss Koenig, Miss Pawle, Miss Royds, Miss Peek, Miss Prioleau, Sir William Farmer, Capt. J. T. Wigan, Major H. Caversham Simonds, Dr. G. C. B. Hawes, Messrs. C. A. and J. R. H. Prioleau, S. E. Garcke, Sidney Harrison, R. H. C. Harrison, A. Wombwell, W. H. Vincent, J. F. Hawkins, Reginald Powys-Lybbe, R. C. Thompson, W. Gratwicke Heasman, Seymour du Bourg, M.F.H., A. D. Selkirk, and W. A. Farmer.

At the conclusion of the luncheon, Major Portal expressed the pleasure it afforded the members to welcome Lord Roberts' first attendance at one of their functions. He also desired to take this opportunity of thanking Lord Roberts for consenting to become president of the club, of which the membership now exceeds one hundred.

Earl Roberts, who was very heartily received, stated that although he did not at present drive a motor car himself, he hoped soon to do so. It was his intention shortly to take up his residence at Ascot, which would enable him to be more regular in his support of the various club meetings. He was confident that county clubs, such as the Berkshire Automobile Club, were doing much good for automobilism by exercising an effective control on the behaviour of motorists within their respective areas. The motor car has already conferred great benefits upon the countryside, by enabling people to tour about the country more conveniently than had previously been possible, and there was every indication that the growing extension of motors of all types would steadily benefit all classes of the com-

munity. The adoption of motor omnibuses in London was a case in point.

Subsequently a garden party and reception were given by Captain and Mrs. E. F. Rhodes at Holme Park, Sonning-on-Thames, and Lord Roberts and Lady Aileen Roberts left for London shortly after 5 o'clock.

British Motor Boat Club.—The Lords Commissioners of the Admiralty have been pleased to issue a warrant, authorising members of the club to fly the Blue Ensign of His Majesty's Fleet. The warrant authorises the Blue Ensign, without any device in the fly, to be worn.

The privilege is a much coveted one, and this is the first occasion on record, we are informed, on which such a permission has been granted for vessels of so small a size.

Various concessions are granted by port authorities to boats allowed to fly the Blue Ensign; these include the use of the naval part of harbours, and in foreign ports this is of particular value.

The Lords of the Admiralty are watching with interest the development of the motor boat, and though they do not see their way at present to using them for naval purposes, there is no doubt that the granting of this warrant is due to the particular interest they take in the movement, and the part motor boats may play should war ever break out.

Ladies' Automobile Club Gymkhana.—Ranelagh, on Saturday afternoon, was the Mecca of the fashionable motoring world, for the principal event on the programme was the Ladies' Automobile Gymkhana. Last year Ranelagh was also the scene of an automobile gymkhana, but peculiar interest was imparted on the present occasion because the entry list was exclusively reserved for members of the Ladies' Automobile Club.

Eleven ladies entered cars, and the programme included three competitions of skill in driving, and also an appearance in suitable

former of these two appearance competitions was won by Mrs. Ernest Amsden with her 16-24-h.p. Germain, and the latter by Mrs. Claude Borrett with her splendid 22-h.p. Crossley. It is an ironical fate which bestows on Mrs. Claude Borrett a valuable prize for her handsome "turn out," and yet precludes her from using it during the fashionable hours in the Park. What is good enough to win a prize at Ranelagh might conceivably have been sufficiently inoffensive in the eyes of a less fastidious First Commissioner of Works.

Fresh from the morning rain—which at first looked as if it was going to spoil the proceedings by continuing all day—the grass lawn track was rather "heavy," and the larger cars experienced a certain amount of difficulty in getting away after any enforced stoppage. The restricted area at the far end of the course, too, put a premium on short wheel bases when the car turned about to come home, but several ladies displayed a quite professional ability in the manipulation of their change-speed-levers, and the use of the "reverse" in performing this manoeuvre.

The following is a list of the competitors, with the results of the respective events:—

List of Competitors.—1, Mrs. Ernest Amsden (16-24-h.p. Germain); 2, Mrs. Claude Borrett (22-h.p. Crossley); 3, Mrs. J. Foyster Bowen (18-22-h.p. Daimler); 4, Miss C. Browne (10-12-h.p. Cupelle); 5, Mrs. Nevill Copland (12-h.p. Talbot); 6, Mrs. Edmunds (20-h.p. Renault); 7, Mrs. Guy Hardy (10-h.p. Panhard); 8, Mrs. Herbert Lloyd (30-h.p. Daimler); 9, Mrs. Manville (16-h.p. Daimler); 10, Miss M. E. Morris (28-h.p. Daimler); 11, Mrs. Todd Newcombe (16-20-h.p. Richard-Brasier).

Bending Race. Eight entries (Nos. 1, 4*, 5, 6*, 7, 8, 9*, 11).—1st, Miss C. Browne (10-12-h.p. Cupelle); 2nd, Mrs. Herbert Lloyd (30 h.p. Daimler).

Crawling Race. Seven entries (Nos. 1, 4, 5, 6, 8, 9, 11).—1st, Mrs. Todd Newcombe (16-20-h.p. Richard-Brasier); 2nd, Mrs. Herbert Lloyd (30-h.p. Daimler).

Bomb Race. Seven entries (Nos. 1, 4, 5, 7, 8, 9, 11).—1st, Mrs. Manville (16-h.p. Daimler); 2nd, (Mrs. Todd Newcombe (16-20-h.p. Richard-Brasier).

General view by the Pavilion on the course.

Strawberries and cream in front of the Club house.

LADIES' AUTOMOBILE CLUB GYMKHANA AT RANELAGH.

Appearance Competition (cars and occupants suitable for touring). Six entries (Nos. 1, 4, 5, 6, 7, 8).—1st, Mrs. Ernest Amsden (16-24-h.p. Germain); 2nd, Mrs. Hertert Lloyd (30-h.p. Daimler).

Appearance Competition (cars and occupants suitable for the Park). Eight entries (Nos. 2, 3, 4, 5, 8, 9, 10, 11).—1st, Mrs. Claud Borrett (22-h.p. Crossley); 2nd, Mrs. Todd Newcombe (16-20-h.p. Richard-Brasier).

Lady Cecil Scott Montague distributed prizes to the winning competitors.

Ladies' A.C.—The committee's report for the past year states that the year has been a successful one. The membership list has been steadily added to until now it numbers 330. The financial position is in every way satisfactory, the income and expenditure account showing a considerable balance on the credit side. The club house has been well frequented by members and their friends since June, 1904, nearly four thousand of them having made use of the rooms.

It has been decided to form a motor club for Pontypridd.

North-East Lancashire A.C.—On June 22nd Mr. Fred Hodgkinson gave an "At Home" to the members of the club at his residence, Higher Feniscowles Hall, Pleasington, near Blackburn. The invitations were for 3.30, and soon after that time a large number of cars had put in an appearance. Altogether 20 cars were present, owned by the following members:—Dr. Paterson, 6-h.p. Humber; T. J. Hacking, 12-h.p. Gladiator; Mrs. W. Birtwistle, 18-h.p. Crossley landaulette; Dr. Stephenson, 12 h.p. Whitlock Astor; William Birtwistle, 22-h.p. Daimler; R. Spencer, 14-h.p. Minerva; F. J. Marwood, 12-h.p. Belsize; E. A. Riley, 18-h.p. Belsize; R. Clayton, 9-h.p. De Dion; W. D. Coddington, 14-h.p. Lanchester; H. Lonsdale, 15-h.p. Darracq; W. T. Entwistle, 8-h.p. Darracq; T. Saul, 10-h.p. Brown; T. Higham, 18-h.p. Belsize; F. Hodgkinson, 15-h.p. Argyll; R. Lord, 10-h.p. Vulcan; A. L. Marsh, 5-h.p. Rexette; A. C. Beard, 6-h.p. Empress; Dr. Fox, 18-h.p. Belsize; and Mr. E. N. Hodgkinson, 9-11-h.p. Clement-Talbot, who is not a member.

The Midland Automobile Club, at their meeting last week, voted the sum of 10 guineas towards the Legal and Legislative Defence Fund of the Motor Union. This fund now amounts to nearly £300.

Mrs. Todd Newcombe's car, a winner in the Appearance Competition.

LADIES' AUTOMOBILE CLUB GYMKHANA AT RANELAGH.

MOTOR CYCLING.

THE One-third Litre Consumption Trial, which is annually organised by *L'Auto* on the Paris Parc des Princes Track, is fixed this year for September 19th. The regulations are in the main the same as last year, the Trial being run over 100 kiloms. on the track, and change of drivers being allowed, but the machine must in no way be replaced. This year the number of entries for each make of machine is to be limited to four, as the principle of unlimited entries last year was tried, and it is this year thought advisable to give the other system a chance. As before there will be the challenge cup for regularity in running for specified "teams" of the same make.

A RACE for motor bicycles is being organised to take place in the second fortnight of September by *Les Sports* on the French Ardennes Circuit, which gives a course of about 75 kilometres, good roads, without neutralisation. There will be two classes, viz.: (1) for motor bicycles with a maximum weight of 50 kilogs. to race over a distance of 400 kilometres; (2) for motor bicycles with $\frac{1}{2}$ litre cylinder capacity over a distance of 300 kilometres. It has not been so far decided whether each of these is to be run in one stage or two.

L'Auto have also arranged for a similar event, with about 25,000 francs in prizes. Machines under 50 kilogs. can be entered, and the distance of the non-neutralised run will be 400 kiloms. The date suggested is the first part of October, and it is hoped to find a suitable course at Morvan.

Mrs. Todd Newcombe laden with her prizes.

APROPOS of the suggestion put forward by Mr. Weir in the House of Commons that a further tax should be imposed on motor cars, Mr. S. F. Edge writes to us that he sees no reason why people who prefer being propelled by mechanical power should pay more than those dragged by animals, which are in many cases uncontrollable. He adds that it would be more practical if Mr. Weir were to propose that a heavy tax should be levied on all car owners who employed foreign drivers, his reason being that the country has no real hold upon the latter, and that when they have made things too hot for themselves here by repeated negligence or furious and reckless driving, all they have to do is to return to their own country. There is undoubtedly a great deal in this contention. As a matter of fact, the automobilist already pays considerably more than the hippomobilist to the revenue. He has to pay the same amount annually in carriage tax, and in addition he has the expense of car registration and a yearly renewal of his licence, and, in most cases, the licence of a driver as well. Everybody, too, is agreed that the greater proportion of cases of furious driving are due to chauffeurs who take out cars without their masters, and there certainly seem to be good grounds for believing that in this respect chauffeurs of foreign nationality are the worst offenders.

MOTOR BOATING.

British International Cup.—Only three French boats, viz., De Dietrich VI., Hotchkiss III., and Loodit III., have been entered to take part in defending this Cup for France at Arcachon on September 11th.

On the other hand, six boats on behalf of England have sent in their entries to the British Club with the hope of representing Great Britain in fighting to bring back the Cup to England. These are the 40-ft. Saunders - built boat, fitted with a 180-h.p. Napier engine, entered jointly by Mr. Lionel de Rothschild and the Hon. John Scott Montagu; the second is Napier II., entered by Mr. S. F. Edge; the third is the 40-ft. boat built and engined by Messrs. J. W. Brooke and Co., and entered by Capt. B. D. Corbett and Mr. Mawdsley Brooke; the fourth is Hutton II., built by Messrs. Hart, Harden, and Co., and engined by J. E. Hutton, Limited; the fifth, "The Competitor" (Napier Minor hull fitted with a 100-h.p. Siddeley engine), entered by Lieut. Mansfield Cumming, R.N., Rear Commodore to the Motor Yacht Club, and the sixth is Lord Howard De Walden's featherweight Napier with Saunders hull and Napier engines.

The start of these boats in the Eliminating Trials for the honour of representing Great Britain takes place off Sea View Pier on August 1st. The course is about $2\frac{1}{2}$ miles long, and an excellent view of the race will be obtained from the pier.

The harbour officials at Southampton are taking great interest in, and are doing all they can to make a success of, the Solent Fortnight. It is hoped that dry dock No. 3 or No. 4 will be available for mooring the motor boats.

BRITISH INTERNATIONAL CUP.—Brooke I, the high-powered boat which has been entered by Messrs. J. W. Brooke and Co., of Lowestoft, for this Cup. Our photograph shows the huge engine being dropped into the Brooke boat on Thursday of last week. The boat will probably be able to have its first trial trip by the end of this week.

Motor Boats at Kiel Regatta.—The chief results in the races for motor boats on two days of this Royal regatta were as follows:—

Course Kiel-Eckernförde, 78 kiloms.

Bleichroder Cup, 18 to 25 meter boats.—1, Karin (400-h.p. steam); 2, Rover (150-h.p. steam).

Hohenlohe Cup.—1, Elise; 2, Knirps; 3, Muguette.

Daimler Cup.—1, Napier.

Course Kiel-Travemünde, 120 kiloms.

Emperor's Cup.—1, Karin.

Simon Cup.—1, Lord Howard de Walden's Napier (steered by A. MacDonald).

Napier, the only British boat present, succeeded in doing the fastest time, averaging 23 knots per hour, in addition to carrying away two first prizes of the meeting.

Aix-les-Bains Meeting.—Unfortunately, on the second day of the motor boat races on Lake Bourget, the marking of the course had shifted, and consequently the published times for the marine mile and kilometre can hardly be regarded as of any use. For the Quinones de Léon Cup, offered for boats using alcohol as fuel, there was only one starter, viz., Herald. The distance given in the programme was 62 kiloms., but upon re-measuring this, following a protest by the owner, it was found to be 600 metres in excess. Herald's time was 5h. 1m. 26s., whereas the maximum time allowed for covering the distance was 5 hours. Under these circumstances, the judges determined to award the Cup to the Herald.

Algiers-Toulon.—The official awards of the Committee for this motor boat race have now been issued. Madame Du Gast has been, so far as the Algiers-Mahon stage of the race is concerned, adjudged the winner. Madame Du Gast lodged a protest against Fiat on the ground that Fiat carried a crew of four only, instead of five according to the rules, and that she was not decked—also an infringement of the rules. It was suggested that in view of International courtesies these objections should be passed over, but Count Récopé reminded the Committee of the decision in the British International Cup whereby the trophy was awarded to Trefle-à-Quatre at the Cowes Meeting last year, in consequence of the innocent mistake which was made by the Napier boat, although her time was considerably worse than the Napier's. Count Récopé's view was shared by the rest of the Committee and therefore Madame Du Gast's Camille is adjudged the winner. It was determined, however, to admit Fiat into an "extra-reglementaire" class, in which she is awarded a prize. The 2nd prize goes to Mercedes C.P., the 3rd to Mercedes-Mercedes, the 4th to Quand Meme, the 5th to Heracles II, and 6th to Malgre Tout. The Mediterranean Cup, it has been decided, shall not be awarded this year.

One of the latest types of the new 10-h.p. 1905 De Dion Bouton models. The car is of the twin-cylinder type, fitted with metal-to-metal clutch and sliding spur-wheel gear and is owned by Mr. Walter Munn, who is seated at the wheel.

At the hotly-contested Finsbury election some 100 motor cars were employed in driving electors to the poll.

In the catalogue of Mrs. Brown Potter's furniture and effects at Bray Lodge, Maidenhead, Lot No. 694, the last, was a 7-h.p. Panhard Car.

At the annual general meeting of the Coventry Chamber of Commerce last week, Mr. Henry Sturmev, who represents the Duryea Motor Company on the Council of the Chamber, was elected a vice-president.

MR. J. A. BRODIE, Surveyor to the City of Liverpool, to whose experiments in combating the dust-fiend we have often alluded, has been asked by the City Council to arrange for the laying of 12 ft. wide tracks of asphalt along the sides of the main streets, to be reserved as much as possible for cycles and motor cars.

DR. HERBERT JONES, of Hereford, in a paper read at the provincial meeting of the Incorporated Society of Medical Officers of Health, held at Lancaster recently, entitled "The Public Health Aspect of Motoring," gave a most valuable testimonial to automobilism. In his opinion, the more fully horse traction is replaced by motor traction, the more disease, which is so greatly caused by the wholesale dissemination of organic material, will be lessened, while a not less important consideration was the advantage which would accrue to towns by the removal from their centres of all the horses now stabled there. The compensating disadvantage of the dust nuisance, Dr. Jones is confident, will be ultimately got over by chemists and engineers.

THE Motor Union is holding a great meeting at Chester, instead of Manchester, as previously arranged, on the 15th of July, which, it is hoped, will be the greatest gathering of automobilists that has yet taken place in the United Kingdom. All the burning questions connected with the movement are expected to be fully discussed, chief amongst them being the increasing severity of fines for offences under the Motor Car Act, police methods of prosecution, and the supineness of the authorities in taking any steps to organise a central control of the roads. The proposals to further tax automobiles are also expected to come up for discussion.

THE British Empire Motor Trades Alliance advise us that they have received an inquiry for the names and addresses of British firms who manufacture gear boxes, axles and steering connections.

MESSRS. THORNYCROFT have issued a new edition of their Handbook of Instruction to Drivers of Petrol Commercial Vehicles. The little volume is well arranged and suitably got up for the pocket. Users of Thornycroft vehicles will do well to see that their drivers are in possession of this useful work.

The above fine array of twelve motor omnibuses are a batch of machines supplied during the last few weeks to the London Road Car Company, Limited, by the Motor Car Emporium, Limited. A few dozen more batches of like character, which are in training for early delivery, will make an astonishing difference in the carrying capacity of the Company, and in the appearance of the traffic on the various routes which these cars are destined to serve.

Horse-Driving Road Hogs.—A very bad case of running down was recently reported to the Motor Union, as occurring on the main road between St. Albans and Barnet, in which the defendant was Joseph Elisha, a job-master, of Duncan Street, N. Two summonses were issued by the union—one for having prevented Mr. F. N. Kingsbury, of Perrymead Street, Parsons Green, from passing on the highway, and the other for having on June 4th furiously driven a carriage at Shenley.

Mr. Huntley Jenkins, for the prosecution, said that on the day in question Mr. Kingsbury, while driving a motor car between Barnet and St. Albans at Ridge Hill, came up to a party of beanfeasters in a brake drawn by four horses. Wanting to pass, he sounded his hooter, but instead of going to the proper side, defendant pulled his brake into the off side of the road, leaving no room for the motor to pass, although the road at this part was about 23 feet wide. The motor was driven behind the brake for 300 or 400 yards, during which time the occupants of the car were subjected to insults and jeers from the beanfeasters. After a time, defendant went to the proper side, and a man in the brake sitting beside the driver beckoned to the prosecutor to pass. While the motor was passing, the brake was wilfully pulled again to the off side, and two alternatives were offered to the prosecutor. He had either to smash into the brake and run the risk of injuries to the occupants of the car, or to drive on to the footpath, 10 inches above the level of the road, and damage the motor machinery. He selected the latter alternative. Mounting the path, the machinery underneath the motor was damaged, and the car came to a standstill. The driver of the brake and the other occupants knew what had happened, but they had not the grace to stop. They drove ahead, leaving the motor stranded on the path.

Amongst the witnesses who confirmed counsel's statement was Mr. F. W. Kingsbury, who added that two cyclists, who were unknown

to him, who had followed him from Barnet, came to his assistance. After helping to straighten his steering which was considerably damaged, and to get the car on the road once more—as the footpath at this place was ten inches above the level of the road—the cyclists kindly volunteered to search for the char-a-banc. It was ultimately discovered on a bye-road, and with the assistance of a policeman the name and address of the driver was taken.

Mr. C. A. Taylor, of Luton, one of the cyclists who assisted Mr. Kingsbury, said he was a witness of the occurrence, and volunteered his assistance to Mr. Kingsbury, and went in search of the driver of the char-a-banc.

For the defence, one of the beanfeasters, James Hursey, said that all the time the motor was behind the brake was on the near side. There was no room for the motor to pass the brake, the road was so narrow. He beckoned the prosecutor to pass, waving his hand in a forward direction over his head. By this he intended to convey to prosecutor that it was hopeless for him to pass unless he flew over the top of the brake.

The chairman said that in the view of the Bench it was a very bad case, and a serious accident had only been narrowly avoided. The maximum penalty of £5 would be imposed and 12s. 6d. costs, or the alternative of a month's imprisonment.

The second summons was withdrawn.

IN recent reliability trials for motor cycles, Eisenach to Berlin and back, the first seven competitors used Continental tyres, and of forty-three successful riders in the Berlin to Frankfort-a-Main trials, thirty-one were on similar tyres. Another big score was made by the makers of the Continental in the International Cup Motor Cycle Race on the Dourdan course, when the cycle of the winner, Wondrick, of Austria, was fitted with Continental tyres.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E. Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

10385. 5th May, 1904. Improvements in Oil Engines. James W. Cross, 4, Trafalgar Square, London. In this invention the engine works on a cycle consisting of compressing air, drawn in on the suction stroke, to a suitable pressure on a compression stroke, the air so compressed being divided into two separate portions, forcing a charge of oil into one of the two portions of compressed air, and effecting ignition of this charge, and then causing the ignited mixture of oil and air to mix with the remaining portion of air, so that the mixture is completely

burned, and the two portions form the motive fluid used for producing the next working stroke of the engine. There are seven figures. Fig. 2 is a sectional elevation in a vertical and central plane. The combustion chamber end of the cylinder, *a*, and the inner end of the piston, *b*, are respectively constructed with annular tubular extensions, *d*, adapted to telescopically fit when the piston arrives near the end of its compression stroke, and form two separate concentrically-arranged compressor air compart-

ments, *c* and *f*, the inner of which is provided with an air inlet valve, *g*, and with means by which a charge of oil can be forced at the required times by an oil pump (not shown). The space, *e*, is also provided with the ignition sparking plug, *m*. The piston on its suction-out stroke will draw in air through the valve, *g*. It will then compress the air, which is divided at the top of the compression stroke by the extensions, *d* and *c*, into two portions. The oil is then forced by the pump into the compressed air in the central compartment, and is ignited by the plug, *m*. The further movement of the piston on the outstroke permits the two compressed portions, charge and air, to mix together. This construction, the inventor claims, prevents too high a temperature in the cylinder, *a*. On the next exhaust stroke the products will escape by the valve, *n*. The inlet and exhaust valves are held closed by springs *p* and *q*, and are opened by separate levers, *r* and *s*, respectively, which are depressed by cams, *u*, on the half-speed shaft, *v*, which is rotated on the crank shaft, *w*, by bevel gearing. June 15th, 1905.

16959. 3rd August, 1904. Improvements in the Clutch, Brake and Change-Gear Mechanism of Power-propelled Vehicles and Vessels. F. W. Lancaster, 53, Hadley Road, Edgbaston, Birmingham. The object of this invention is to permit of the construction of a combined clutch and change-gear mechanism of the epicyclic type in which the power

Fig. 1

is received and transmitted direct without the employment of a peripheral transmission, and to construct a clutch and a brake which shall be capable of an indefinite amount of slipping without much wear or injury. There are seven figures. Fig. 1 is a longitudinal section in a central plane. The pins on which the planets, *b*, are mounted project from a face plate, *c*, which is arranged to form the cover of a box, *d*, in which the clutch parts are enclosed. The end of the motor crank shaft, *a*, and carries in driving-connection with it one of the frictional elements of the clutch, the other element being in driving-connection with the box, *d*. From the centre of the box, opposite the end of the motor crank shaft, the driven shaft, *e*, commences, and this shaft, the box,

d, and the face plate, *c*, are all secured together. It will thus be seen that the box that contains the clutch forms the means by which motion is conveyed from the change-gear trains to the propeller shaft of the vehicle or vessel. On the driven shaft, *e*, next the clutch box, *b*, is a sliding collar, *f*, operated longitudinally by mechanism from the driver's seat, and a number of small plungers or pins, *g*, pass through the wall of the box, and by applying pressure to the clutch rings within it cause the clutch to become operative. The brake acts on the driven shaft by reversing the movement of the lever, *h*, pressure is applied to the other series of rings by means of the gear wheel, *i*, and the car is brought to rest. The inner drum, *j*, of the Weston clutch is keyed to the end of the motor shaft, *a*. In the face of each ring are a number of radial oil grooves. The grooves or key ways on the inner drum, *j*, by which the rings are driven are cut to such a depth as to provide a free oil circulation through them. The whole arrangement is conveniently encased in an oil-tight casing, *k*, bolted to the crank case, *m*. June 15th, 1905.

PASSING EVENTS.

Are Touring Car Speed Contests Advisable?

WE feel convinced that the policy of the Automobile Club in according its countenance, sanction, and support to high-speed contests for touring cars of the kind which will be held at Brighton next week, and which the town of Blackpool is straining every nerve to emulate and even surpass, is at the present time exceedingly ill-advised.

There are many other methods of benefitting the automobile cause which at present would be much more generally useful, and would possess the further advantages of showing that the Automobile Club are really anxious to help in removing possible causes of friction, and amongst these we would suggest popular demonstration of what the Club is doing in regard to combating the dust nuisance, and ensuring the suppression of the motor hooligan and the road hog. It is not so much mere speed as the dust produced, which excites bitter prejudice in country districts, and gives rise to such widespread hatred and hostility towards the car and its driver. In time, when road conditions are changed, other ideas will also have changed, and then possibly speed racing pure and simple may have its votaries without in any way raising the ire of the populace. Until that time, it behoves every automobilist to use every effort to quell the rising storm which, if ultimately bowed to by Parliament, may sweep away all the good which has been achieved up to the present. In the meantime it should not be surpassingly difficult to devise some means of encouraging the sporting side of the movement in a legitimate manner without enraging the masses.

Racing is all very well in the case of events like the Gordon-Bennett Cup, where the contest is confined to regular racing cars, all more or less monstrosities in their way, and which are practically not allowed, and as a matter of fact are hardly ever driven, on our highroads. Racing cars have been designed to show what triumphs in the attainment of high speed modern engineering can effect. They are quite outside the purview of the ordinary man in the street or on the road. It is a different matter when the Corporation of a large town and the Automobile Club, in concert with one another, arrange to demonstrate *urbi et orbi* that touring cars such as he may meet frequently can get up speeds rivaling those of the express train, and far surpassing the speed of the trains by which he is accustomed to travel.

Particularly at this Time of Year.

WE are now in the enjoyment(?) of the dog-days. It is the dustiest season of the year, when cars, driven at high speed along the high road, set up enormous clouds of dust, blinding and half smothering foot passengers, infuriating cyclists and the drivers of hippomobiles of all kinds and descriptions, filling their eyes and mouths with dust and setting their animals coughing and choking, and coating the natural green of our hedges with a drab neutral tint. On many roads, therefore, the inhabitants are going about with rage in their hearts, and, we fear, sometimes with brickbats in their hands. What will they say when they hear that at Brighton or Blackpool ordinary touring cars—unaltered in any way—have made speeds of 50 and more miles an hour? "No wonder," they will say, "that these things (with an epithet) raise the dust," and the first vow

they will make is that they will absolutely refuse to vote for a single Member of Parliament at the next election who has not solemnly pledged himself to abolish the nuisance.

How it will Hamper the Automobilist M.P.s.

IN Parliament, and out of it, feeling, as it always does in the dog-days, is growing dangerously hostile. We submit that it is not diplomatic, it is not far-sighted, it is not even common-sense, to deliberately encourage high-speed touring cars. It is all very well to say that no decent motorist actually indulges in such high-speed travelling on the roads, but are the public going to believe it with such object-lessons before them? When Mr. Arthur Stanley gets up in the House of Commons, at the time that the next Motor Car Bill is introduced, his power to prevent reactionary legislation, which would seriously cripple the automobile movement, will be likely to be decidedly hampered in consequence. If he is to be greeted with cries of "Brighton," "Blackpool," and "fifty miles an hour," such interruptions will be disconcerting, not to say embarrassing.

Speed-Concealment Useless.

IT will be little use for the Club to attempt to take refuge in the "ostrich policy," which we dealt with the week before last, of refusing to disclose the speeds attained. People will find them out—probably even exaggerate them—or else say that the Club has refused to publish them because they were too awful for publication. No, the whole thing at the present time is simply a mistake, and it is not as if anything useful were to be learned from it. It does not show that the tourist car that wins is the most durable, or that it is the vehicle best suited to everyday requirements. The presumption is, in fact, quite the other way. It does not show the maximum speed an automobile is capable of, for that can be far exceeded by regular racing cars, and it does not constitute a real car test. The whole business, in our opinion, is a mistaken line of policy, and the Club would be well advised to drop it, and drop it quickly.

But the Industry must be Convinced.

WE trust to the good sense of the leading members of the Club to see the matter in this light, but at the same time it is to be hoped that car manufacturers and agents throughout the country will take active steps to support our view, should the attitude of the Club not rapidly undergo modification, for it is they who will incur the danger of ultimately paying the penalty. If as the result of the weapon which will be placed in the hands of our opponents, some reactionary legislation is introduced—a return to the 12-mile limit for example—the effect on their business will be paralyzing. Competition naturally compels them, if such events are held, to enter for them, so they must see to it that the Club refuses to hold them. If they do not control the action of the Club, but merely follow it, they will be like the rats running after the Pied Piper of Hamelin, to their own undoing.

Too Much Gregariousness also to be Depreciated.

FROM the point of view of the dust nuisance and of conciliating public opinion as much as possible, big motor car meets such as have been arranged by the Motor Union, in which as many as 200 cars congregate at a given place and proceed in various directions into

the country, are, at any rate at this time of the year, and under existing circumstances, also to be deprecated in the very strongest possible terms. Even where everyone of those taking part in such re-unions drives with the carefulness of the ideal "considerate motorist," and where the utmost care is taken to avoid exceeding the legal limit and driving to the danger of the public, there is still bound to be irritation simply and solely from the enormous clouds of dust raised. It is a different question from the speed question, of course, and cannot, for one thing, be brought up so effectively in Parliament. But the frequent practice of motorists assembling together in large numbers on ordinary roads will certainly do as much as anything else to continue and increase popular irritation, and those having the real interests of the cause at heart will abstain from everything likely to do this.

A Substitute Required.

BUT when all is said, there is little doubt that something in the nature of a sporting contest—in which cars and drivers can be matched against one another—is necessary for the well-being of the automobile movement, and for the satisfaction of car owners. It certainly promotes general interest, and, what is at least of as much importance, it has the effect of making car owners maintain a lively interest in the development of different types of car. Doubtless the Automobile Club has felt this, and we should not be inclined to so forcibly point out the disadvantages attaching to the continuance of mere speed contests over what are practically private tracks, did we not feel convinced that they can now be replaced by something better. At present, as far as any rate as provincial clubs are concerned, the gymkhana is the only species of competition that to some extent fills the gap. But what is needed is, of course, contests of a kind which will both appeal to the manufacturer by enabling him to show the merits of his cars, and also to the private car owner who is not indifferent to the attractions of a sporting competition in which he stands a chance of coming off the winner and carrying home a prize. In fact, at the present day it is not really any longer necessary that *mere* speed should count for anything. Indeed it is opposed, when fully considered, to the sporting interest. But events which put a premium on the individual skill of drivers and upon the *all-round* merits of the car have much more to recommend them. Such events would require on the part of the drivers qualities much more similar to those by which a great jockey wins a race than to those which are called out by the type of motor car race with which we have been previously familiar; for the driver would have to spare his car as much as possible under circumstances in which he knows the fuel consumption is likely to be excessive, and press it as much as possible under circumstances in which he knows that he is getting good speed out of it at relatively small fuel cost. This is just the sort of thing that a jockey has to do in a long race where he has, under certain circumstances, to husband the resources of his mount, according to its personal equation, and it is the kind of thing that is not encountered at all on a race like the Gordon-Bennett. From this, as well as other points of view, we believe that the Tourist Trophy for a big event, or the principles on which it is being organised—modified so as to be applicable to contests on a smaller scale—provides just what is required. It certainly would tend to standardise

cars into certain well-recognised classes, and this in itself would greatly simplify the organisation of all local competitions.

The Tourist Trophy.

IN spite of the good reception which the proposal to hold a race on the lines of the Tourist Trophy received, when first enunciated, we fear that many people in the automobile world have merely the haziest of notions as to what the competition really is, what kind of cars are likely to win it, what kind of information it will provide for the benefit of the prospective buyer, and what amount of interest it is likely to evoke as a sporting event. At present, many people either know nothing about it at all, or consider it to be a sort of glorified fuel-consumption test on a large scale, skilfully stage-managed to look like a race. Needless to say, it is nothing of the sort, and there has been no intention of allowing the prize to fall to the car which merely uses the smallest amount of petrol—a relatively unimportant feature in cars designed for touring purposes. The Trophy will be awarded for vastly different merits than this. It is, indeed, primarily calculated to encourage the best all-round type of touring vehicle, and it may well not only become a regular annual institution, but even prove to be a far more attractive and useful national event than any which have been organised hitherto. So promising are the possibilities of this competition, that the misconceptions prevailing on the subject ought to be got rid of as widely and as quickly as possible, and it is with this object in view that we have considered the whole subject of the racing rules for touring vehicles in an article, of which we print the first instalment this week. This article is designed to remove the misconception that the event is in any way an extended economy contest, to point out how extremely useful the event may be in supplying information to the buying public, and to make certain suggestions as to how the event might be rendered still more serviceable. The line we have adopted is to consider, from an independent point of view, what are the essential requirements of a competition which can, at one and the same time, bring out the good features of the competing cars, and also secure that universal interest which can only be excited by some kind of race.

Co-operation Needed—and Invited.

THE success of the Tourist Trophy depends largely upon appealing to all, including the general public as well as that section who are motorists already. We feel, therefore, that the co-operation of everyone, either directly or indirectly interested in the automobile movement, is desirable, and we are confident that an extremely satisfactory type of contest, on the present Tourist Trophy lines, might be evolved in this way for future years. To start the ball rolling, we are this week publishing the first instalment of a special article explaining the whole question, and we invite our readers to let us have any views—either of agreement or disagreement—which may occur to them on reading the article. Nothing but good can come from the free expression of opinion on such an important subject, and we hope that the information contained in the article will enable all enthusiastic motorists to contribute to the discussion, so that it need not be confined to a comparatively small circle of experts. We think everyone will agree that an ideal racing event should fulfil four main objects:—It ought to be attrac-

tive as a spectacle to the general public, it ought to appeal to the best sporting instincts of owners and drivers, it ought to have the useful effect of encouraging the development of the best touring cars, and it ought to enable purchasers to ascertain the relative merits of the various makes of vehicle. It is with a view of showing how an event may be organised to attain these ends, and of how far the Tourist Trophy, as at present proposed, does so, that we have written the article. Of course, the subject is a very big one. It requires the most careful and concentrated thought, but its successful solution is one of the most important questions for the future of the automobile industry. We do not for a moment suggest that a final solution has actually been provided, but the suggestions and proposals put forward by us will, we hope, prove a useful basis for further progress and development. If the result is to extend and deepen the discussion, and render the proposals ultimately adopted thoroughly suitable to attain the end at which we all aim, we shall feel that we have not opened up our columns to the subject in vain.

For the convenience of those who are keenly interested, and since it is impossible for us to publish the whole of our article in this issue, we shall be pleased to forward an advance proof of the complete article to any of our readers who may wish to have it, and to receive their comments and criticisms in return.

The Alien Drivers' Bill.

So much attention has been drawn to the extent to which foreign motor car drivers who have no stake in the country, and who can retire to their various fatherlands when, owing to their depredations, Great Britain becomes too hot for them, that most people who have the interest of the automobile movement at heart, will be glad to learn that Mr. Scott Montagu is introducing into the House of Commons a Bill to the effect that a licence to drive a motor car shall not be granted by any County or Borough Council to any non-resident alien unless he produces:—

(a) Such evidence in writing from the police authority of his place of residence as the council consider sufficient that his character and conduct as a driver of motor cars has been satisfactory, and

(b) The licence or certificate (if any) authorising him to drive a motor car in his own country.

Owing to the advanced date in the session at which the Bill is being introduced, there is very little chance of its passing unless the House is practically unanimous in its favour, and this, we fear, it would be too much to hope for, but little doubt can exist that the Bill, if passed into law, would be for the general benefit.

The Dust Nuisance Not a New Annoyance.

CONSIDERING the manner in which the motor car has become identified in the Press and the popular mind with the raising of enormous volumes of dust on our roads, and the whitening of our hedges when they would otherwise be green, most automobilists will be thankful to Mr. Leveson Scarth for drawing attention to the fact that there were complaints in the old days of stage coaches of exactly the same kind. Miss Mitford, the well-known author of "Our Village," and the daughter of the well-known historian of Greece, writing in 1830, says:—

"Woe to white gowns! Woe to black! Drab was your only wear. If we happened to meet a carriage coming along the middle of the road, what a sandy whirlwind it was! What choking! What suffocation! No state could be more pitiable, except, indeed, that of the travellers who carry this misery about with them. I shall

never forget the plight in which we met the coach one evening in last August, steeds and driver, carriage and passengers, all in dust."

The difficulty was met on the Bath road at any rate by the establishment of water-carts (with pumps for supplying them at frequent intervals), a relic of the past which many of our readers have gazed upon no doubt with fond regret. That was a great undertaking for those days. Similar enterprise at the present day, a moderate expenditure, and a good allowance of commonsense, may ultimately get over the trouble now.

The Considerate Motorists' League.

WE have referred before to Mr. Scott Montagu's Considerate Motorists' League, approving, of course, of the objects aimed at by the organisation, and we are glad, therefore, to be able to record that a distinct forward step has been taken, and that at the private meeting recently held in the House of Commons the constitution of the League was provisionally settled, an executive committee appointed, and a badge chosen for the new organisation. The object of the League is, as our readers are aware, to promote courtesy to other road users on the part of all motor car drivers, and to curb recklessness and promote a standard of good behaviour on the road. A special feature will be made by the League of appealing to the professional driver so as to get him to conform to the principles of the League, which are set forth in a set of "maxims" to which we have already referred. The maxims are admirable in tone, but we would suggest, with all respect to the League, that one of the best methods of dealing with part of the difficulty would be for all their members to undertake to adopt measures that will render it impracticable for their drivers ever to take out their cars unless under the supervision of themselves or some members of their family. This course of action, if adopted by all the members of the League—and it is to be hoped that the League will before long include the great majority of car owners in the country—would have the effect of eliminating that most unpleasant and dangerous phenomenon of our high roads, the professional driver taking his acquaintances of the opposite sex out for a drive in his master's car, to his own great glorification.

Motor Ambulance Service.—The proposal of the London County Council to establish a general motor car ambulance service for London, which was referred to by us when it was first brought forward, was discussed at the Council meeting on Tuesday. It is proposed to arrange, in connection with the motor ambulances which will be electrically driven, one principal station and seven district stations, with which call posts, similar to those used for fire brigade service, will be set up in the streets at distances of half a mile apart. Telephones will be connected with these call posts, and the police will be provided with keys to enable the telephones to be used. The drivers of the motor ambulances also will be schooled in ambulance first-aid duties. It is further suggested that medical men should be provided with keys in case they desire to use them, while another suggestion is that the casualty house surgeon of the hospital connected with the ambulance should, as in Liverpool, go out with it, and enquiries are being made at the London hospitals as to how far they are willing to co-operate in this scheme. The estimated cost of the proposal appears moderate enough, being put at £13,000 initial cost, and £9,600 per annum for expenditure.

THE GORDON-BENNETT RACE.

Photo by Michelin and Co.

Théry, after his victory, being escorted to the Grand Stand by Mons. Brasier, arm-in-arm.

LAST week we gave briefly the times of the competitors in covering each lap as received by wire, but we have taken the opportunity to again publish this week these times, together with other particulars, so that we may place on record as complete a table of statistics of the race as is possible with the information available. All the times have been carefully revised, and, in addition, the average speeds over the complete circuit have been worked out. The times per lap are gross, no net times being available, but that they approximately represent the regularity of running, will be evident from

the small amount of total time to be deducted for delay in controls.

It is always impossible to tell beforehand who is going to win a race, and at the end of the first lap Lancia's high speed not unnaturally had its effect on the guessing of the spectators. An interesting feature of our table of results is that which shows the relative positions of the competitors lap by lap.

No change, it will be noticed, took place in the order of the first five of the winning cars during the last lap, but Duray's last round secured him sixth place, whereas

Photo by Michelin and Co.

at the end of the third round he was as far back as eleventh in the race. All those who started on the fourth lap finished it, and, as we have already said, in much the same order as they started, with the exception of Duray. Both Bianchi and Braun lost time on this last round, and altered their positions in consequence, Braun dropping down from seventh to tenth, and Bianchi from ninth to eleventh.

Much was said about the advantage to the French team, of their practice on the course, and it is interesting to note that although the remarks were essentially justifiable, the Frenchmen were not the only drivers who

improved upon the times made by them in the French Eliminating Race. Théry's net time in that event was 7h. 34m. 49s., but the first four drivers in the actual event—which includes the two Italians, Nazzari and Cagno, on their Fiats—all made better times.

With regard to fastest times, however, Théry's record of 1h. 36m. 25s., which he made in the Eliminating Trials, was hard to beat, and only the intrepid Lancia—who is popularly supposed to drive "all out" round every corner on the course—succeeded in lowering it by completing the tortuous circuit of 85.3 miles in 1h. 34m. 57s., which is equivalent to a speed of 54 m.p.h. Even Théry himself never approached his old record, and it was, one might almost say, a retrogression on his part to ever have put up a record which differed so much from his average.

Photo by Michelin and Co.

GORDON-BENNETT RACE.—Cagno on his Fiat waiting to be scaled.

GORDON-BENNETT RACE.—Blanchi on the Wolseley Car after rounding the "grand tournant."

GORDON-BENNETT RACE.—Clifford Earp on the 6-cylinder Napier taking the Baraque bend at top speed.

Théry's victory was a just reward for such skilful and well-judged driving. Nothing seems to disturb his calm confidence, and his capability for driving by the clock is little short of marvellous. Not once only, but throughout his racing career, has this been a feature of his performances, and his right to the nick-name, "Chronometer" Théry, is shown at a glance by the annexed table which appeared in the *Morning Post* :—

On the whole, the event was perhaps rather remarkable for regular driving than otherwise. Cagno on his Fiat, for instance, did not vary more than 4m. between any two laps, and the English team also made steady

Place and Date.	First Lap.	Second Lap.	Third Lap.	Fourth Lap.
	h. m. s.	h. m. s.	h. m. s.	h. m. s.
Mazagran, May 20, 190.	*1 23 0	1 19 0	1 16 0	1 26 0
Taunus, June 17, 1904	†1 26 57½	1 26 45½	1 29 56½	1 26 22½
Auvergne, June 16, 1905	*1 49 52	1 36 25	2 9 47	2 6 45½
Auvergne, July 5, 1905	*1 41 7	1 48 57	1 48 42	1 40 56

* Gross times † Net times.

There were six laps for the Mazagran circuit, and Théry completed the last two rounds in 1h. 23m. and 1h. 27m. respectively, which was well up to the average of the first four laps as shown in the above table.

GORDON-BENNETT RACE.—The Hon. C. S. Rolls on his Wolseley Car at the Baraque turning.

Photo by Michelin and Co.

GORDON-BENNETT RACE.—The crowd at the starting point by the Grand Stand.

running although it proved unfortunately too slow to place them in the front rank. The fact that 12 out of 18 starters finished (66 $\frac{2}{3}$ per cent.) is in itself satisfactory, and as a coincidence it happened that exactly the same number finished in last year's race, when there were also 18 starters. Five of the 12 competitors who finished this year also finished last year's circuit, these being Théry, De Caters, Braun, Cagno, and Werner.

One hour and thirty-five minutes separated Bianchi from Théry in this year's results, but a glance at our table will show how close was the struggle for second place

between Nazzari, Cagno, and Caillois. A considerable interval separates Werner from Caillois, and the times of the next six drivers are comparatively close together, so that those who finished appear to be divided into two classes, of which Théry and Werner are the respective leaders.

Information respecting the troubles of competitors *en route* are always difficult to ascertain in such events as these. Those cars and drivers who had not apparently vanished into thin air during the race made haste to do so immediately they had finished, carrying with them

Photo by Michelin and Co.

GORDON-BENNETT RACE.—Before the start. At the Michelin Company's "Tribune."

GORDON-BENNETT RACE.—Wolseley Car (No. 8), driven by the Hon. C. S. Rolls, at the Dunlop Tyre Company's depot at Pontgibaud. As at last year's race, Mr. Frederic Coleman, of the White Steam Company, will be seen acting as the "good Samaritan" in connection with the British cars.

the secrets of their day's run. Théry had one puncture, but otherwise his running was, as he himself expresses it in the columns of our French contemporary, *L'Auto*, "*très régulière et très heureuse*." Nazzari also suffered from one puncture, and also considers that he lost time in passing the American cars; while Cagno, the most successful of the Italians, had to tighten the belt drive of the mechanical lubricator.

Of the English team, the Hon. C. S. Rolls writes us that some time was lost on his first three rounds through having to clear out the dirt which found its way into the lubricator. Near Pontgibaud, during the third round, one of the driving tyres burst and the car had to be driven to

the next dépôt on the rim. Later on the other three tyres were changed, and the last round was made under exceptional difficulties, because the seat came adrift, which necessitated holding on by the steering-wheel and the brake-lever. Earp had trouble with the petrol-tank and with a shock-damper on one of the side-springs. Both Earp and his brother—who was acting as his mechanic—suffered terribly from the dust and tar getting into their eyes, so much so, in fact, that they could hardly see during the last lap. Some other drivers also experienced this difficulty, but those who knew the course had, not unnaturally, had goggles specially constructed to be quite dust-proof.

GORDON-BENNETT RACE.—Baron de Caters with his Mercedes Car at the "Continental" Tyre Depot near Pontgibaud. Compressed air for the tyres and fuel replenishments.

RESULTS OF THE GORDON-BENNETT RACE, AUVERGNE CIRCUIT, JULY 5th, 1905.

Bianchi, who came in last of the English drivers, had the misfortune to have an exhaust-valve break, but his driving was nevertheless very regular throughout.

Although both Werner and De Caters made good running for the German team, Jenatzy's performance must have been a sad disappointment to many spectators, no less than to himself. He had trouble with a broken petrol pipe and a front spring among other things—including tyres—and eventually abandoned the race. De Caters had trouble with his valves, and, like Lancia, he had the misfortune to kill a dog.

Hieronymus, driving an Austrian Mercedes, was another competitor who had valve troubles, while Lancia—the only unsuccessful Italian—was put out of the race owing to his radiator being smashed by a stone. The American team did not fare well, although one of them succeeded in getting in at the finish. Dingley burst a water pipe, and retired on the first round, and Tracey broke a driving-chain and a clutch-pin.

The Montagu Trophy this year again goes to France for securing the first, fourth, and sixth places. England was the only other country to get her three representative cars in at the finish. Italy and Germany had two cars home, while Austria and America were represented in the final lap by only one car each. The Montagu Trophy was presented by the Hon. J. Scott Montagu, M.P., as a prize to be awarded to the best team performance in the Gordon-Bennett Race. No definite system of marking, however, has been drawn up for the purpose of enabling each competing country to be placed in any order of merit, and it is, therefore, only the actual winner which can be specified in this connection—the donor of the trophy reserving the right of final decision.

There were, of course, many notable persons in France who witnessed the race in a more or less official position, but the following were the delegates of the competing clubs on the International Commission of the Gordon-Bennett Cup:—

France.—Chevalier Rene de Knyff.

Germany.—Count de Sierstorff.

England.—Mr. J. W. Orde.

America.—Mr. Gray Dinsmore.

Austria.—Count de Kolowrat.

"Starting Prices."—Although no very serious betting takes place in connection with motor racing, it is—in the light of the results—interesting to notice the latest odds before the start laid against the success of each competitor, which were as follows:—Théry (evens), Cailliois (2 to 1), Jenatzy (3 to 1), Duray (5 to 1), De Caters (6 to 1), Lancia and Werner (10 to 1), Braun, Rolls, Cagno, and Hieronymus (12 to 1), Burton, Earp, and Bianchi (15 to 1), Lytle, Dingley, Tracy, and Nazzari (20 to 1).

Acceleration Times.—The column of acceleration times which we publish in our table of results must, of course, only be read in a comparative sense. There is no indication to show that each car had not previously settled down to its stride, since this could only be ascertained if a number of times had been taken at different distances from the start. In connection with the French Eliminating Trials, these times were taken over a distance of 400 metres, which would appear to be a much more suitable length for the purpose than those selected on the present occasion. Assuming, for instance, that each car finished "accelerating" exactly as it passed the 400 metre line, and that the rate of acceleration were uniform, then the rate of travel at that moment would be twice the average speed indicated in our table on

La Baraque. The village between Clermont Ferrand and the starting point at Laschamps. In the distance is the famous Puy de Dome.

The turning and rise before La Baraque.

The Puy de Dome seen from the Laschamps Plain, where the start takes place.

Finish of La Baraque ascent.

AUVERGNE CIRCUIT.

GORDON-BENNETT RACE.—A series of good-natured character sketches of prominent celebrities in connection with the Gordon-Bennett Race, by "Mich," of "Les Sports": 1. Chevalier Rene de Knyff; 2. Edge; 11. Heath; 12. The Touring Club de France; 13. Franz Reichel; 14. Alexander Burton; 15. Charley; 16. Jenatzy (Le Diable Rouge); 17. Jellineck Mercedes; 18. The Baron Pierre—19. The other Baron Pierre.

page 758 of our last issue. A car taking, say, 25 secs. for the distance (starting from rest) would thus have attained a maximum speed of about 72 m.p.h., and would have accelerated up to that speed at the rate of 4 ft. per sec. during every sec. It is interesting to notice that this would require a stress upon each driving tyre of about 140 lbs. Considering that the stress per driving wheel due to road resistance and windage is only some 40 lbs. with such cars, the additional strain under such conditions will be seen to be very considerable, and it is,

in fact, something like 20 per cent. in excess of that imposed on the tyres when climbing an extremely steep hill. How much driving tyres were called upon to stand in this year's race, however, is really demonstrated most forcibly when it is realised that quite twice as much stress is thrown upon the tyres when pulling up quickly for negotiating corners as when accelerating, and there were 177 corners on the course where it was necessary to slow down, to say nothing of the three controls.

GORDON-BENNETT RACE WINNERS SINCE 1900.

Year.	Course and Total Distance.	Winner.	Car and Driver.	Time.	Average Speed
				h. m. s.	m.p.h.
1900	Paris-Lyon (347.5 miles) ...	France ...	20-h p. Panhard (Charron) ...	9 9 0	38.5
1901	Paris-Bordeaux (329.8 miles) ...	France ...	40-h.p. Panhard (Giradot) ..	8 54 59	40.0
1902	Paris-Innsbruck* (386.2 miles) ...	England ...	40-h.p. Napier (S. F. Edge) ...	10 41 58	34.0
1903	Irish Circuit (370.6 miles) ..	Germany ...	60-h.p. Mercedes (Jenatzy) ...	6 39 0	49.5
1904	Taunus Circuit (321 miles)...	France ...	80-h.p. Richard-Brasier (Théry) ...	5 50 8	53.0

* Part of the Paris-Vienna Race.

NON-SKID TYRES AND THE GORDON-BENNETT RACE.

NON-SKIDS and their efficacy in preventing a car from slithering crabwise over the temporarily greasy surface of roads has become a topic—now mellow with age—to which the touring motorist never turns a deaf ear. So much is at stake; he may not mind the varnish on his 800 guinea car, but he objects to break his neck, or possibly the case is *vice versa*, but the fact remains—a side-slip is an objectionable performance both when made publicly or privately.

Now it is not only skidding which harrasses the already occupied mind of the driver of a high-speed racing car, there is the rapid wearing away of the tyres when, failing to get a grip, they whirr round in space, and there is a possibility that they may prematurely burst in consequence. On a racing car, therefore, a non-skid of sorts is a desideratum even on a dry day, and it was for this reason that the new Michelin tyre was used in this year's Gordon-Bennett Race. With its construction our readers are already familiar from the illustrated description which we gave last week, but the following translation of a communication from M. Michelin is in itself an interesting commentary on the subject:—

"The ever-increasing weight and speed of motor cars had rendered the use of non-skids an absolute necessity.

MR. COWLEY LAMBERT, the Guildford magistrate to whose denunciation of the unfair methods adopted in motor car prosecutions we drew attention last week, has been asked by a local paper for his reasons for taking such an unusual step. He has refused to be

In turning a corner the centrifugal force, acting at the centre of gravity—which generally lies towards the back part of the car—tends to slew the car round about a point situated near the bonnet. If this effort is excessive the back wheels skid sideways over the ground, but with the heaviest part of the car in front it is, of course, the steering wheels which skid, and the front tyres which burst if the strain is sufficiently great. In both these cases the uncertainty of what is going to occur causes a possibility of accidents, especially at high speeds. This is overcome by fitting the tyres with metal studs which, getting a grip of the ground, prevent the car from skidding at all.

The first non-skids made had the studs fastened on the rubber of the tyre, but they did not give satisfaction because rubber was found to be insufficiently strong to prevent the studs tearing out. After this came the non-skid with a complete leather casing all round the cover. It held on, but was detrimental to the cover and inner tube. When on the road the cover heated, leather being a bad conductor of heat, and the heat, concentrating inside, baked the inner tube and made it so brittle and inextensible that it finally burst.

The Michelin non-skid tyre, which has now been placed on the market, aims at preserving the advantages of leather as a medium for the attachment of the metal studs, without at the same time having the disadvantages which are pointed out above. The leather band is only on that part of the tyre which touches the ground and the rest of the tyre is identical with a smooth-treaded one, thus allowing the heat to be well radiated. Besides this, the non-skid retains all the flexibility of an ordinary tyre. The studs around the tread naturally afford great protection to the tyre against punctures, since half of the exposed surface is imperforateable and the other half—being of leather—is very difficult to penetrate.

It is necessary to remember, however, that in using this non-skid, as all other tyre protectors, a car should be driven carefully, and corners should be taken at a reduced speed. The effect of starting quickly is the same with all kinds of smooth-treaded tyres—the wheels spinning without being able to get a grip on the ground. This, of course, causes the tyres to wear out quickly, perhaps even to burst, or to leave the rim. By attaching rivets or studs to the cover, however, the adhesion of the tyre to the ground has been much more perfect, but nevertheless care must be taken. If a brake is applied suddenly when travelling at say 50 miles an hour, something must go; either the road will be torn up under the rivets, or the mechanism will smash. In conclusion, it must be remembered that although the motoring public have an excellent article in their hands, they must not take advantage of it, but use it in a considerate way."

drawn at any length, and merely states that his action was due to his opinion "that the want of discrimination shown by magistrates and police in dealing with the question, is calculated to bring justice into contempt."

THE 1905 DE DIETRICH CARS.—PART III.

THE igniters, D, are, as will be seen presently, actuated by an independent cam-shaft from beneath. Each of them is connected by flat contact springs, D¹, with a rotary switch, D², that enables it to be cut out of action, for testing if required. The construction of the igniters is well shown in Fig. 12, and is very simple. The rocking-arm, D¹, passes through the main casting, D, carrying the contact-making arm at its inner end and the lever-arm by which it is operated on its outer end. The contact-arm is normally pressed up against the insulated plug, D³, by the flat spring, D², and the plug, D³, is so made that it can be screwed out separately.

pivoted lever, B⁶, lying in front of the crank-chamber. The sliding keys normally form a smooth surface where they pass through slots in the cam faces, but when moved along the shaft, their projecting portions come into play—lifting the exhaust-valves during the first portion of the compression strokes.

The ignition-cam-shaft, E¹, is only enclosed in the crank-chamber at its centre and at its ends, but it is driven by the same spur-wheels as those that drive the main cam-shaft. The wheel, F⁶, on the crank-shaft meshes with an intermediate wheel, F⁷, (Fig. 13), and it is this wheel that gears with those on the two cam-shafts.

Fig. 13.—The 24-h.p. De Dietrich Engine. On the left, are views from beneath and from the side of the upper portion of the crank-chamber. On the right is shown the crank-shaft, with its pistons and connecting-rods, and a view is also given showing the base-chamber from above.

The crank-chamber is formed by the two castings, F¹ and F², which are shown separately in Fig. 13. The former constitutes the upper portion, to which the cylinder castings are bolted, and the latter is provided with six feet, by which the engine is secured to the frame. The casting, F², which is lightened out considerably, forms the upper half of the three main bearings for the crank-shaft, F³, and it completely encloses the main cam-shaft, on which are mounted the exhaust-cams, B⁴, and the inlet-cams, B⁵. This cam-shaft is rendered accessible from outside by the two detachable doors, F², and, mounted upon it, are sliding keys that can be made to form half-compression projections for the exhaust-cams. These keys are controlled by the vertical rock-shafts, B⁵, that pass through the top of the crank-chamber, above which they are both connected to the

The ignition-cams operate the push-rods, E, in just the same way that the cams on the other shaft actuate the rods, B³ and C⁴, but a special timing gear is introduced between the cam-shaft, E¹, and its spur-wheel, by which it can be partially rotated, in one direction or the other, in relationship to that wheel. Three spiral keys are used for this purpose, their sliding-sleeve being controlled by the short shaft, E², that projects from the casing. The rock-shaft, E², is connected by the rod, E³, and the lever, E⁴, with the hand-lever, E⁵, (Fig. 3) above the steering-wheel.

Mounted centrally on the cam-shaft, E¹, is a spur-wheel that drives the magneto, E⁶, this wheel meshing with a corresponding wheel of equal size on the shaft, E⁷. The magneto spindle is driven by the shaft, E⁷, through a jaw-coupling that enables it to be removed at any time

quite easily; the magneto is bolted to the casting, F¹.

No other auxiliary ignition system is, as a rule, employed, although the supplementary battery apparatus introduced by Messrs. Jarrott and Letts can be fitted to the car if required. Except that a single spring serves for operating each igniter, and that the magneto is "timed" simultaneously with the ignition-cams, the system does not differ from that on other well-known cars. The type of switch, D⁴, used for each igniter is, however, particularly neat, and the igniters themselves have unusually substantial tappets. A main switch, D⁶, (Fig. 14), enables the magneto to be short circuited, and the igniters to be cut out of action.

The crank-shaft, F³, is a solid forging, to which the fan flywheel, F⁴, is bolted by means of a register flange. It has large bearing surfaces, it carries, inside the front end of the crank-chamber, a ball bearing, F⁵, to take the thrust of the clutch, and, on its extreme front end, is the fitting, F⁸, for the starting handle.

Between the pinion, F⁶, and the fitting, F⁸, is fixed the chain-wheel, G², that drives the circulating pump, G, and the pulley wheel, G⁶, for the belt-driven fan. An uncommonly useful feature of the engine is that the periphery of the flywheel is marked off in such a way as to enable the precise position of the crank-shaft to be ascertained at any time; not only are the two dead centres indicated in this manner, but the proper positions at which the igniters and the valves should be operated are marked as well.

The pump, G, is of the centrifugal type, and is made in such a way that the gland can be easily adjusted.

bourhood of the exhaust-valve-chambers, and is conducted back to the radiator from the opposite side of the cylinder-heads by the pipe, G⁴. In frosty weather, it is easy to drain the entire system, for not only is there a cock beneath the pump, but cocks, G⁸, are also pro-

Fig. 14.—The dashboard on the 24-h.p. De Dietrich Car. In this illustration, the auxiliary, gravity-feed, petrol-tank (A¹), the mechanical lubricator (H¹), the ignition switch (D⁶), and the exhaust relief valve (A³) are clearly visible.

vided at the bottom of each cylinder-jacket. The fan, G⁵, which is driven by a wide flat belt, runs on ball-bearings, and is fitted to the engine in such a way that the belt is kept at a proper degree of tightness by the spring, G⁷.

Lubrication.

The engine is fed with oil through the branched pipe, H⁵, from the lubricator, H¹, on the dashboard, the quantity passing being regulated by the adjustable sight-feed-fitting, H⁴. The oil is led to each of the four pistons as they complete their down strokes, but for the most part the oil is distributed over all the bearing surfaces by the movement of the working parts.

The lubricator is driven from the engine by a belt, and is kept full from the pressure-tank, H, which is fixed at the side of the car. The two pipe connections seen on the left in Fig. 14 connect the lubricator with the supply tank, and it is the pipe connection, H³, to which the feed-pipe, H⁵, is coupled up. The required amount of oil can be forced into the crank-chamber by the hand-pump, H², and there are cocks with gauges in the base of each half of the crank-chamber.

An additional oil-cup, H⁶, is also provided immediately above the central bearing of the crank-shaft, this merely leading into the chamber and not to that bearing alone.

(To be continued.)

Fig. 12.—Two views of a De Dietrich Igniter.

The driving-chain passes over the wheel, G¹, which, being smaller than the wheel, G², causes the pump to run at a high speed. The water is delivered by the branched pipe, G³, into both water-jackets in the neigh-

Motor Volunteer Corps.—The following announcements are gazetted this week:—Gentlemen to be Lieutenants: John F. Stanley, Earl Russell, Fred J. Frost, Harold R. Mosenthal; Charles Buttar, M.D., to be Surgeon-Lieutenant; the Rev. C. W. L. Evans is appointed Acting Chaplain.

Proposals are being submitted to the military authorities for the reconstruction of the corps, car owners to have commissions and motor cycle members to rank as sergeants, the rank of private being abolished.

THE disastrous hurricane to which we referred last week, and which overturned the tents of most of the campers out in the neighbourhood of the race-course, brought down the tent in which the weighing was taking place. After the committee and those present had been extricated from the *débris* and order to some extent restored, the Comte de la Valette, the chairman of the committee, who had escaped injury almost by a miracle, created a good deal of amusement by pronouncing with unruffled calm the famous words, "*la séance continue.*"

INDEX

MARINE GAS ENGINES.—PART III.

THE "CAPITAINE" SUCTION-PRODUCER.

OF such a nature, then, is the producer-gas, which it is now proposed to use in marine gas engines, and of such a character is the plant by which the gas may be made. It is only within the last four or five years that the suction-producer has been commercially manufactured in England, and in this pioneer work the well-known firm of Crosley and Co. has been, as usual, well to the front, and are now among the best known makers of this type of apparatus.

The "Capitaine" Plant.

What is probably the first application of a suction-producer to marine work, is due to M. Capitaine, of

gas is, of course, very hot, and in passing over the boiler it gives up a large part of its sensible heat to the water, and thus generates the steam necessary for the purposes of making the gas. The steam thus generated passes through a pipe, B', to the bottom of the producer chamber, where it is allowed to escape into the hot fuel.

The "Cooler" and "Scrubber."

Even after the gas has passed between the boiler tubes, B, it is still at a higher temperature than is desirable for satisfactory use in a gas engine, and in order to further cool it it is then passed through a chamber, C, where it is caused to give up its heat to the water which is sprayed into the cooler chamber. Baffle plates are arranged, it will be noticed, in this chamber, in order to make the gas take a circuitous path, and so to ensure that it shall have time to become thoroughly well cooled. The gas, as it leaves the cooler, is still unfit for use in the engine, for it will, undoubtedly, be damp, and, in all probability, it will have some solid impurities, such as particles of ash, &c., suspended in it. In order to remove these impurities the gas is passed through a mechanically-driven "scrubber," H. This device is a centrifugal apparatus which, by whirling the gas at high speed, causes the solid particles, and the water, to be thrown outwards, and deposited, so that the gas passes to the engine by the pipe, H', in a pure condition. The "scrubber" is driven by a belt which passes

Fig. 3.—Views of the Capitaine marine plant, showing the general arrangement of engine and gas producer, and also (on the right) the gas producer, A, with its cooling chamber, C, separately.

whose apparatus we are able to give photographs and line drawings. Our first illustration shows the boat "Capitaine," which has been fitted up with a suction-producer plant, and gives a very good idea of how small a boat may be and yet use this class of engine. Another illustration (Fig. 2) shows a view of a larger plant fitted in place in "Gasschlepper I.," Fig. 3 is a line drawing of the complete plant, and Fig. 4 is a sectional elevation through the producer apparatus.

Of these illustrations Fig. 4 gives the most comprehensive idea of the actual gas-making part of the plant, and, from what has already been said, the arrangement of the producer-chamber, A—shown on the left—will be readily understood. Besides this, however, there are two other chambers, C and H, which will be referred to presently. The producer chamber, A, is fed with anthracite coal through the doors, A², but a fire has, of course, first of all to be lighted on the fire-bars at the bottom. The producer is got under way by the aid of a hand-fan, which is used for blowing air through the fire, and the fumes that are given off during the operation are allowed to pass into the atmosphere. Under working conditions, the centre part of the producer is a mass of incandescent fuel, and the top part, surrounding the boiler, B, is kept filled with fresh coal which replaces the lower layers as they are consumed. In order to prevent radiation the centre part of the producer-chamber shell is "lagged" with fire brick.

The gas generated in the producer passes among the tubes of the boiler, B, and so into the pipe, A¹. This

Fig. 4.—The Capitaine Suction Gas-producer. Sectional elevation through producer and the cooler, showing the arrangement of the boiler, B, inside the former.

over the pulley, H², from a corresponding pulley on the engine crank-shaft, A. Mounted on the end of the "scrubber" spindle, is the circulating pump, K, which supplies water for the cooler and for the cylinder jackets.

A feature of this particular form of "scrubber" is that the gas is delivered to the engine at a pressure which is

slightly above atmospheric. The actual means by which the gas is drawn off from the producer is not, therefore, the suction of the engine itself, but the exhausting effect of the "scrubber." It will be noticed, too, that the cooler chamber and the scrubber have, in themselves, a certain volumetric capacity which does, in effect, act as a reservoir for the gas, and prevents any too sudden changes taking place in the producer-chamber owing to rapid increase or decrease of the engine-speed or load.

The Engine.

It must be understood that the gas, as it arrives from the suction producer, is not used in the engine before it is diluted with additional air, sufficient to form an explosive "mixture." This operation is accomplished in the "Capitaine" plant by means of an automatic valve which is designed to compensate for any fluctuations which may be likely to occur in practice, such as, for instance, any increase or decrease in the pressure at which the producer gas is delivered from the "scrubber."

Comparatively few particulars are, at present, available as to the construction of the "Capitaine" engines—which are built in both two and four cylinder types—but Figs. 2 and 3 show the general lines of a four-cylinder engine of this make. The engine is said to run at a moderately high speed, and the magneto ignition is auto-

matically "timed" by means of a centrifugal governor. The arrangement of the overhead cam-shaft is visible in Fig. 2, and the valve-springs are prominent in Fig. 3. The engine driven "scrubber" can also be seen in Fig. 2, beneath the exhaust-box, which is supported on brackets secured to the engine casting. The engine is started by compressed air stored in a tank below the floor

Size and Cost.

As regards the cost of running, the data available show that a 10-h.p. engine consumes 0.5 kilogs. of coal per h.p. hour, the consumption for 30-h.p. and 100-h.p. plants being 0.4 kilogs. and 0.36 kilogs. respectively. With anthracite at 24s. per ton, the cost on the above consumptions is equivalent to 0.166d., 0.113d., and 0.102d. per h.p. hour for the three types of plant under consideration. The floor space occupied by a 25-h.p. engine is 2.4 ft. by 5.8 ft., and the head room required is 3.96 ft. With a 50-h.p. engine the length is 7.9 ft., but the other dimensions remain unaltered, while the weight is increased about 25 per cent. Engines of 25-h.p. have two cylinders, but the 50-h.p. size has four cylinders. It is interesting to note that J. I. Thornycroft and Co. have recently taken up the "Capitaine" marine plant in this country, and developments may, therefore, be expected to take place in home waters.

THE SIDDELEY-MEYAN MATCH.

THIS contest, the preliminary arrangements for which have excited considerable attention, actually started at 5 o'clock on the morning of Wednesday from Paris, Mr. Siddeley being represented by an 18-h.p. Siddeley car, and M. Meyan (that is to say France) by a 24-h.p. De Dietrich. The Siddeley car which is taking part in the contest has already run some 40,000 miles, and is, as a matter of fact, the first car of its type that was ever completed. The De Dietrich car, which is being driven by M. Meyan personally, has also a good record, having already covered 30,000 miles. The Siddeley car will be driven by Mr. M. Grahame White, of the A.C.G.B.I., who will be relieved on alternate days by Mr. V. G. New, of the Kent Automobile Club. The route, part of which will traverse the Alps, has been reduced at M. Meyan's request to 4,400 kiloms., and will cover almost every conceivable kind of surface and gradient, very beautiful scenery being passed through. We append the conditions which are regulating the contest, but it may be added that, in addition to these, it has been arranged that a seat on each car is to be reserved for a friend of the other competitor, who will act as "controleur" or observer. The gentleman who is acting in this capacity on the Siddeley car is to have a fair knowledge of the route, to prevent missing the way. The contest, which is for a stake of 10,000 francs, will be decided by the 26th of the present month, when the 4,400 kiloms. will have been completed. Both cars can use any tyres they like—French, German or English.

ROUTE OF SIDDELEY-MEYAN TRIAL.

July.	kiloms.
12th.—Paris to Boulogne, via Mantes, Rouen, and Dieppe	326
13th.—Boulogne to Sedan, via Lille and Valenciennes	320
14th.—Sedan to Luxeuil, via Nancy and Epinal	292
15th.—Luxeuil to Aix les Bains, via Lous le Saunier	330
16th.—Aix les Bains to Embrun, over Mont Cenis	287
17th.—Embrun to St. Raphael, via Nice	289
18th.—St. Raphael to Beziers, via Nimes	337

19th.—Beziers to Luchon	286
20th.—Luchon to Bayonne, via Col d'Aspin, Col de Tourmalet and Lourdes	268
21st.—Bayonne to Royan, via Bordeaux	312
22nd.—Royan to Nantes, via Les Sables d'Olonne	264
23rd.—Nantes to Brest, via Quimper	319
24th.—Brest to Granville, via Dinan	300
25th.—Granville to Trouville, via Trigny	304
26th.—Trouville to Paris, via Mantes	200

CONDITIONS.

1. The competing vehicles to be ordinary touring cars, capable of carrying four people. Every seat to be occupied during the trial. The cars to be driven by gentlemen, members of an automobile club.
2. The daily run to be about 320 kiloms. The total journey to be about 4,400 kiloms.
3. The competitors can start each morning any time after 5 o'clock, and must finish the day's run at 7 o'clock latest. From the point of departure to that of arrival the competitors have complete liberty as to pace and stops.
4. Repairs are permitted during running time only, and must be done with the touring kit, and without outside help, an exception being made for tyres.
5. The daily run will be divided into sections of about 50 to 60 kiloms. each. The competitors will be controlled in each of the sections, and the times noted by the observer in a book carried on each car. Each section must be traversed at a minimum average speed of 25 kiloms. per hour. A stop of two hours will be made for lunch. All control times and stops will be noted in the route book by the observers.
6. The car which fails to arrive at the last control at 7 o'clock will be disqualified, and loses the match. The car which fails most often to maintain the average speed of 25 kiloms. per hour in the different sections of the route loses the match. If the two cars fulfil the conditions of the match equally it will be declared a dead heat, and the stakes will be returned to each of the competitors.
7. In the event of illness, or unforeseen circumstances necessitating it, the drivers may be replaced.
8. At the finish of a day's run, washing, greasing, filling of tanks, change of tyres or sprockets may be proceeded with, but no repairs. Where possible the cars will be interned during the night.

THE TOURIST TROPHY, AND ITS VALUE TO CAR OWNERS.—PART I.

Pros, Cons, and Suggestions.

ALTHOUGH a considerable amount of interest has naturally been aroused in the minds of the entire motoring public over the international race, to be held in September, for the Tourist Trophy, yet it is obvious that no little curiosity has been excited as well, and that the majority of car owners have but the haziest idea as to how far this contest—which is to be run on entirely new lines*—will be of any real value to them. One might, perhaps, even go further, and say that the prevailing notion concerning the event results from an entire misapprehension, for we have reason to believe that a large number of motorists look upon it as being little more than a glorified fuel-consumption test, which has merely been given the semblance of a race by the ingenuity of the organisers. Since they rightly deem the cost of fuel to be a comparatively insignificant item in practice, it speaks well for the minor merits of the competition—or for the confidence that they have in the wisdom of their representative body—that those holding these ideas should take as much interest in it as they do. In view of all this, and also because it is quite possible that the Tourist Trophy will, within the next few years, prove to be the automobile race of the year, in this country at any rate, we propose—in compliance with the requests of several correspondents—to deal in a general way with this subject, to show how far the rules for this year's race will secure the desired result, and to consider the extent to which such events are likely to be of real value to purchasers of touring vehicles in the future.

Its Raison D'Etre.

To begin with, we may pass very briefly over the reasons why such a competition has been mooted at all, for not only are they all of a fairly obvious character, but they have been pointed out time after time by us and by the Press generally. Shortly stated, the automobile industry has now developed to such a pitch (1) that the limit of speed on ordinary roads has been reached (or passed) by cars that are racers pure and simple; (2) that the racing chassis of to-day is practically useless for any other purpose; but (3) that the buying public will probably always be largely guided, in the choice of a car, by the racing successes of the makers. A racing event is therefore required for *touring* cars, but the rules must be such that no dangerous speeds can be indulged in, and that (so far as possible), the winning cars will be those which would be the most serviceable to private users.

Why a "Race"?

If only because a race (in which the first man in is the winner) is an event which is understood by every Englishman, it would be highly desirable that the Tourist Trophy should be conducted on these simple lines. It will then not only appeal to the public in a way that no ordinary kind of reliability or hill-climbing trial can ever be expected to do, but it will also constitute a contest of an even more exciting spectacular

kind than does the Gordon-Bennett Race. But, apart from such relatively superficial considerations as these, there is no reason why the event should not take the form of a race, because it is quite as easy—if not more so—to make "speed" the final determining factor, as any other attribute, and the speed capabilities of a car must, in any case, be looked upon as one of the chief indications of its power, its reliability, and its efficiency. The "race" element is, indeed, most valuable, even if it is only looked upon as a means of giving every part of a car considerably more strain than it would have to withstand in ordinary use, and as imposing sufficiently severe running conditions to neutralise the superior skill of the professional drivers who handle the cars in the race.

The "Points" of a Good Car.

The words "reliability," "durability," "speediness," "flexibility," "silence," "absence of vibration," "ease of control," "comfort," "smokelessness," "efficiency," &c., have become so extremely familiar to all motorists that, although they very thoroughly sum up the most desirable characteristics of a good touring car, they have almost ceased to be as definitely expressive as they once were.

"Good Points" in Touring Car Construction.

Those which are placed at a premium in <i>any</i> race.	Those which are also put at a premium in the "Tourist Trophy."	Those which can be enforced by special rules.	Those which can only be secured by arbitrary rules permitting disqualification at discretion.
Reliability. Speediness. Ease of Control. Flexibility. Hill-climbing.	Durability. Efficiency. Absence of Vibration. Smokelessness.	Roominess of Body.	Silence. Absence of "Freak" devices.

A glance at each will, nevertheless, show how difficult it is to frame rules for any racing event in such a way as to put a premium on them all, or even to do so in such a way that a car having some obvious bad points shall not win. Fortunately, however, the majority of the good points enumerated above favour the chances—all other things being equal—of any car that is running in a race, and, even more important from the point of view of the Tourist Trophy, not only are others put at a premium, but most of the good features are rendered still more valuable to a competitor, if the rules compel him to run as economically as possible. Take, for instance, "durability" and "absence of vibration." Both may mean a possible gain of speed in any race, because less power is lost in doing useless work, but the benefits of both are rendered vastly more evident if a competitor actually makes a direct score by saving that amount of power.

Fuel-Economy, *per se*, Unimportant.

We have specially referred to the last-mentioned matter here so as to clear the ground for what follows, and in order to refute the impression that fuel-economy, as such, has had much to do with the existing Tourist Trophy rules. Primarily, as we shall show presently, fuel-consumption has been selected merely as a means whereby the speed of the cars can be limited, and,

* The Regulations, issued by the A.C.G.B.I., were given in our issue of 10th December last.

although there are very important subsidiary advantages, low-fuel cost, *per se*, is quite a minor one that could only have any material weight if it were the question of commercial vehicles that were at issue. The really important advantage of low consumption to the car owner is that it effects a far greater saving than is represented by the mere value of the fuel. We refer to the ill-effects produced by any wasted power. A brief consideration will show that there cannot be much power available for doing *harm*, if nearly all the energy that the fuel can give is turned into *useful* work, but, on the other hand, high fuel-consumption is sure to be accompanied by some detrimental effects. It may be that only a part of the fuel is consumed, and then the remainder is liberated to contaminate the air, and, incidentally, to feed the anti-motoist. It may be that some of it is used in unduly heating the cylinders or the exhaust passages, and then the valves are apt to suffer, and, indirectly, the engine is called upon to expend more power in operating and propelling the heavier cooling apparatus. Or, most serious of all, it may be that a good deal of the power developed by the engine is expended in wearing away the bearing surfaces of the transmission mechanism, and then just that fatal depreciation which is so impossible to detect in most short-duration trials is in reality taking place on the car.

The Essential Restrictions.

It is obvious from what has already been said that one of the first things that has to be decided is as to how all but *bonâ fide* touring cars can best be excluded from a competition of this kind, without at the same time introducing restrictions which might be unfair to some vehicles, and might tend to favour the chances of some specially constructed, but commercially faulty, car—or, in fact, some freak. Practically, this point resolves itself into two questions—how to limit the speed capabilities, and how to enforce touring-car requirements. By rendering it impossible for any competing car to maintain a high average speed, not only will racing cars be excluded, but the effect of the event will be to direct the chief attention of manufacturers to the perfection of a certain type of pleasure vehicle, and by so framing the rules that they enforce touring-car requirements, the further development thus induced will be of such a nature as to be directly beneficial to the motoring public.

How to Limit "Speed."

Although the two questions just mentioned are to a certain extent mutually dependent upon one another, yet it will, we think, be found to simplify matters a good deal if we confine our attention, to that of "speed" first, and briefly consider the chief different methods by which it might be restricted. Starting with the axiom that "speed" primarily depends upon the relationship of power to weight, one might almost jump to the conclusion at once that the engine power must in some way be limited, and that a minimum load or weight of car must at the same time be ensured, but, although that also is the conclusion to which we must come ultimately, there is one alternative suggestion presenting itself that should be briefly mentioned. We refer to the employment of a weight limit *only*, which may at first sight appear practicable, if the stipulation were made that a certain dead-load had to be carried. It is true that this might be made to serve the duty of keeping the speed within reasonable bounds, and that the imposition of a

dead-load would prevent spider-built machines from competing successfully, but then there is—amongst others—the fatal objection that the sole aims of manufacturers would be to sacrifice everything as far as possible to employ the largest and most powerful engines. The result would, in fact, be far from that which is desired, and therefore we are brought back once more to the consideration as to how best to limit engine-power also.

How to Limit Engine-Power.

Numerous are the proposals that have already been made for arriving at a fair computation, by means of calculations and measurements, of the power of automobile engines, and although the object has usually been somewhat different—for handicapping at hill-climbs and speed-trials or for motor boat work*—yet the possible methods are the same. In the present case, it is quite unnecessary to specify what the horse-power of the engine shall be, or even to select a system that will incidentally enable the approximate horse-power to be estimated. It is the performance of the *car* as a whole, not merely that of the engine with which we have to deal, and the only object of imposing a power-limit at all is that which has already been dealt with.

The following are the various methods that suggest themselves:—Specifying (1) the over-all cubic measurement of the engine, or (2) the total weight of the engine (with or without flywheel), or (3) the total cubic displacement of the pistons per revolution, or (4) the total cubic displacement of the pistons per minute, or (5) the rate of fuel consumption per hour, or (6) the rate of fuel consumption per mile.

Comparatively little need be said concerning the two first mentioned, for it is only too obvious that either would prove a direct incentive to the construction of freak-engines. If over-all dimensions were, for instance, to form a basis, accessibility would naturally be sacrificed in order that the cylinders could be made as large as possible, and if, on the other hand, a weight allowance were selected, then the "best" car would probably have a very fragile, and needlessly costly, engine.

Limitation of cylinder dimensions is not quite as impracticable as those just mentioned, for it certainly would leave the makers free to obtain the best results without departing radically from the best known practice, and it would, moreover, be an easily comprehended standard of size. Unfortunately, however, there are several strong reasons that militate against its adoption, these being that it places an unduly large premium on high-speed running, that it tends towards increased output at any cost, and that it involves troublesome measurements being taken by the officials who conduct the race. High speeds, although by no means *necessarily* detrimental as such, are, conversely, not essentially advantageous, so that—apart from the fact that the engine efficiency decreases at very high speeds, even though the output may still be increasing—it would be extremely inadvisable to compel makers to strive in this direction. In the same way mere high output, as such, is not so important as to warrant unqualified encouragement, for, as already pointed out, any waste of power is more or less harmful; it might well be that an engine might stand being "forced" to the utmost during the race, but that its life would in reality be a comparatively short one. The troublesome measurements to which we refer are

* On January 14th last we dealt at some length with the particular matter.

those of actually checking the cylinder dimensions stated by the competitor, for in any so important event as this it would be essential to do so. It is one thing to measure the quantity of fuel that is put into the tank, and to guard against any attempted deception, but it is quite another matter to ascertain the total piston displacement accurately, even if a means were found for doing so without actually dismantling the engine.

From another point of view, moreover, this suggested method is open to very adverse criticism. By specifying a certain piston displacement, the winning car would probably be that which was capable of taking full charges into its cylinders during each and every suction stroke, and was able to maintain the best richness of mixture (from a maximum power point of view) during the entire race. The engine would, therefore, not only be designed so that it could be "forced" at times, but the designers' further object would be to enable the driver to ensure continuous "forcing" throughout the event. To this end, the engine itself would undergo development in a very undesirable direction, and further than this, freaks in the way of change-speed mechanisms would be inevitable, since it would only be by multiplicity of "speeds" that the full available power of the engine could be utilised on all and every gradient met with.

The fourth suggested method only differs from that which we have just considered inasmuch as the substitution of piston displacement per *minute* for piston displacement per *revolution* eliminates any direct premium on high-speed running. Otherwise it is open to the same objections—though possibly to a slightly less extent. But what is perhaps more important at the moment, is that it introduces other very serious difficulties. Virtually insuperable is that of determining the engine-speed for the purposes of the race, for engine-speed is naturally a very variable quantity, and the "nominal" speeds of makers mean but little. In practice, the adoption of this means for limiting engine-power would involve the employment of some more or less complicated recording instrument on each car, say, for instance, a special revolution-counter that would automatically stop the car when the permitted piston displacement had been exceeded; even this device would need a clock mechanism to be combined with it unless "average piston-displacement per mile" were selected as the basis for the limitation of power.

Probably the point of view from which the adoption of piston displacement has appealed so forcibly to many is that it apparently goes to the root of the matter by giving an actual measure of engine capacity. Regarded in this light, and if it did so satisfactorily, it would be excellent, but unfortunately—as we have shown—this is not the case. It is just from the same standpoint, however, that the remaining methods, with which we have yet to deal, are so attractive, and it will, we think, be found that, in their case, no insuperable difficulties arise, nor is an undue premium placed on the development of any undesirable engine characteristics. We need hardly devote much time to the relative merits of the two, because the points that chiefly concern us apply with equal force to both, and because "fuel consumption per *mile*" is so obviously preferable to "fuel consumption per *hour*," when it is cars rather than mere engines that are on trial.

It is true that even this fuel-consumption basis does put a certain premium on "full-load" running, and that there is therefore an advantage to be obtained from the

employment of multiple-speed-gear mechanisms, but this is only the case in so far as economical working is concerned, and high-engine speed, as such, is actually deprecated. It is also true that this method does not necessarily ensure quite *all* the "good points" of touring car requirements—silence, convenience, and comfort, for instance—but one cannot hope to obtain everything "at one fell swoop," and we have other suggestions to make concerning them presently.

Practically what this selected method of limiting the engine-power amounts to is:—that a certain quantity of fuel is allowed for the purpose of transporting a certain weight a certain distance, and the vehicle which can perform the work in the shortest time under these conditions is the winner. Nothing could well be more in accordance with the real requirements of motorists, provided that the weight corresponds with that of their vehicles, and that the fuel allowance renders possible the desired speed. On the one hand, the fuel represents a certain amount of energy; on the other hand, a certain amount is necessary for transporting the weight the specified distance; the car which obtains from the fuel the greatest amount of mechanical energy on its driving-wheels will have the highest balance in hand, and therefore that car can afford to travel at the greatest speed. Expressed in this way, it is possible that the full advantages that would accrue to the "best" car in the race are not at first sight evident, and it is, moreover, quite likely that some of our readers have not hitherto realised the effect which speed has on the fuel-consumption of a car. It may be thought, for example, that, since the energy in the fuel sufficiently exceeds the energy required for the work in hand, the question of speed will not be of very serious moment, but that the effect of the rules will rather be to determine which competing cars can cover the whole distance, and which will run short of fuel before having done so. It may, in fact, appear as though higher speeds would only involve a comparatively small increase in fuel-consumption due to windage and to greater road-resistance, and that, therefore, any trivial delay on the road, from any cause, might hopelessly reduce the chances of success of even the best car, since the speed of all would be approximately the same. As a matter of fact, however, nothing of the kind need be anticipated, for the same determining factors that exist in any other race are still retained to the full in the Tourist Trophy, and the fuel economy of any engine is very materially affected by its own speed and by that of the car. Cars which fail to complete the course, through lack of fuel, might therefore have reached the winning post if they had been driven at a lower speed, and it is safe to say that very great differences will be found between the average speeds of those cars that do pass the post.

Another advantage that results from the choice of fuel consumption as a means of limiting power, is that the race need not be restricted to petrol cars, but is equally open to steam vehicles. This fact does, as a matter of fact, open up other questions—such, for instance, as the relative allowances of different kinds of fuel—but they do not concern us in the present article, and are, after all said and done, of minor moment. Possibly the chief drawback is the difficulty that is sure to be experienced in determining the proper amount of fuel that should be allowed on any particular occasion, to suit the actual road conditions that exist at the moment of running the race.

(To be continued.)

THE WOLSELEY VACUUM CLEANER EQUIPMENT.

Two views of a specially-constructed self-propelled machine, which has just been completed for the British Vacuum Cleaner Company by the Wolseley Company, are given in the accompanying illustrations. The propelling mechanism and the 12-h.p. engine are arranged

petrol to enable the engine to run all day continuously, if needed. An unusually large radiator is also provided, with a similar object in view, and, behind it, is a fan that draws sufficient air through it even when the vehicle is stationary; an extra water tank is also fixed beneath the engine. Above the body is a strong canopy which is well adapted for carrying the hose-pipes, amongst other things, and there is a ladder fixed to the side of the body for giving ready access to the roof. At the back is a step that affords accommodation for two men.

In order to render the exhaust gases unobjectionable when the plant is in operation outside a private house, the silencer is fixed up under the canopy, and the gases are led up through the canopy into the open air. In other respects, too, considerable forethought has been brought to bear upon small, though important, details by the designers—as, for instance, in completely encasing the entire mechanism.

This useful machine, which is geared to run at normal speeds of 5, 9, 14, and 19 miles per hour

The Wolseley Self-Propelled Vacuum Cleaner.

in much the same way as on the well-known standard Wolseley cars, but the chassis has in this case been modified considerably to render it suitable for its purpose. It has a very strong and rigid channel steel frame, and the axles are also heavier than usual, while, to ensure rigidity, the track has been increased to 4 ft. 8 ins., which is 5 ins. wider than standard. The wheel-base is 8 ft. 2 ins., the weight of the vehicle is about 3 tons, and the wheels are shod with "Sirdar" solid rubber tyres—twin tyres on the driving wheels.

The cleaner plant is fixed, as seen, at the back of the vehicle, the vacuum reservoir—above the axle—forming the rear-member of the main-frame, and the pump being driven by a "silent" chain from an additional shaft, fixed over the gear-box. This shaft is at rest except when the pump is in operation, and is brought into use by a separate hand-lever which slides a spur-wheel on it into mesh with a corresponding wheel on an extension of the first-motion-shaft of the ordinary change-speed-gear. The main-clutch then controls the pump in the same way that it controls the car, when travelling.

Included in the equipment, are six or eight lengths of hose, special tool boxes, and a sufficient storage of

Another View of the Vacuum Cleaner.

respectively, has a very smart appearance—with its red and white colouring—and undoubtedly forms an extremely compact and mobile power-plant, for which the durable petrol engines built by the Wolseley Company are eminently well suited. It forms yet another of the already numerous types of commercial vehicle made by this progressive firm.

THE BRIGHTON MOTOR MEETING.

WHATEVER the public generally may think of the advisability of motor racing at the present moment, all the inhabitants of Brighton are looking forward with great interest to the approaching speed contests, to be held

that they will not alter their ordinary tariff for the occasion. The arrangements are now practically complete, and what may be considered as the opening ceremony was inaugurated by the Brighton Hotels

Interest Association at their headquarters at the Hotel Metropole on Saturday last. The proceedings commenced with a reception by the Mayor of Brighton at 7.30. After the dinner and the usual loyal toasts, the Mayor referred to the satisfactory manner in which the negotiations between the Corporation and the A.C.G.B.I. in regard to the speed contests had been brought to a satisfactory conclusion in the most agreeable manner possible. He paid a particular tribute to the Secretary, Mr. Orde, whom he said he had found most generous in every respect, though personally he had himself been to some extent criticised for not making better terms on behalf of the Corporation.

It was pointed out by Mr. Orde, who represented the Automobile Club at the dinner, that the course has now become the finest in the world, its great length being a particularly favourable feature, as it will enable for the first time in this country a flying mile to be accomplished, while the attractions of the meeting would be greatly

BRIGHTON MOTOR RACE MEETING.—An inspection of the Madeira racing road last week by the guests of the Brighton Hotels Interest Association.

next Wednesday on the Madeira Walk, and the support which the Town Council have accorded to the undertaking has met with the most widespread recognition. £4,000 in all has been expended on tarmac-ing the Madeira Road, and this in itself will provide an interesting experiment as to the permanent value, as a method of combating dust, of this process. A fine track 1,100 yards in length, of tarmac 4 inches deep, approached by $\frac{3}{4}$ mile of good macadam, will form the speed track. There has been a good deal of fear amongst the public generally, who contemplate visiting the town to be present at the competition, that the hotels will generally raise their prices to a prohibitive figure. It is therefore satisfactory to learn that the Brighton Hotels Interest Association, which includes the Hotel Metropole, the Grand Hotel, the Old Ship, and practically all the principal hotels in the town, have unanimously decided

enhanced by the promised presence of Lancia, who, until the unfortunate accident to his car—the breaking of the radiator by a flying stone—had the best of chances for winning the Gordon-Bennett Race.

The Chief Constable's observations deserve attention, as he recognised that motoring was a permanent institution and should be treated as such. The rarity of summonses and fines in Brighton, he explained, was due to his method of conveying quietly a warning to offending motorists, and he found as a rule the trouble was but seldom repeated.

The assembled guests were subsequently taken to view the racing track on the Madeira Road, followed by a short run round the town, the party being distributed among sixteen cars. A run was also made to Seaford and back in the morning, and in the afternoon to the Devil's Dyke.

Northampton Institute Engineering Courses.—At the entrance examination for the day courses in engineering to be held next September, the Governing Body of the Institute has decided to offer three scholarships for open competition. These scholarships will give exemption from fees, amounting to £52, during the whole of the four years' course in mechanical or electrical engineering.

GENERAL BOOTH has been so satisfied with the results of his motor car tour last year that he has arranged to again employ the automobile in the conversion tour which he is arranging for the present summer. He will commence the tour on his arrival at Folkestone on August 1st, and the tour it is anticipated will be considerably more extended this year than last embracing in all some 2,000 miles.

RACES, RECORDS, AND TRIALS.

Ab-Kettleby Hill-Climb, May 27th—The formal results of the competition which took place on this hill on May 27th last under the auspices of the Leicester A.C. have just been issued, the Du Pre Cup, which was offered for the event, being secured under the handicap formula by Mr. G. F. Reading with his 10-h.p. Wolseley car. The distance was over 1 kilometre, in which the rise is 265.42 feet, the cars starting from rest. The results would prove of considerably more interest if the formula under which the places have been worked out had been also published.

KETTLEBY HILL CLIMB RESULTS, MAY 27th.

DU PRE CHALLENGE CUP.

33	J. M. Bennett, 12-h.p. Darracq (4) ...	21½ 2	100 × 120	158.4
34	E. H. Jeule, 12-h.p. Binks (2) ...	14½ 4	3 × 3½	154.25

Ab-Kettleby Hill-Climb, July 8th.—Entries for this event were confined to members of the Nottingham A.C. on Saturday last, when 28 cars took part in the two competitions, four high-powered Daimlers being entered in the speed contest as well as the handicap. There were some new cars trying their mettle at this hill, and some good ascents were made.

The mile course was used this time, and there was a total rise of about 280 feet. Only one car failed on the hill, and that through a choked carburettor. The speed class was very interesting, the 40-h.p. Daimler beating the best times on this hill of a year ago.

In the speed class the placings were:—Mr. C. Hardy, 40-h.p. Daimler, first; Mr. J. Crosshaw Wilson, 28-h.p. Daimler, second; Mr. F. A. Bolton, 35-40 Daimler, third; and Mr. E. Prestwich, 35-40 Daimler, fourth.

In the club handicap the times were not given, but

the following are the cars placed in order of time. The handicap is to be decided by the Nottingham A.C. Committee:—

	h.p.		h.p.
C. Hardy ...	40 Daimler	P. Huskinson ...	— Simms
T. C. Pullinger ...	16-20 Humber	A. R. Atkey ...	14 Minerva
J. C. Wilson ...	28 Daimler	R. R. Latham ...	12-18 Progress
W. M. Hutchin-son	28-36 Daimler	A. Barlow ...	12-14 Clement-Talbot
W. Blamires ...	24-30 Richard-Brasier	G. P. Mills ...	10 Raleigh
F. A. Bolton ...	35-40 Daimler	H. Bowden ...	15 Darracq

		H. B. Gast ...	10 R. Brasier
		S. Harvey ...	14 Renault

Ightham Hill-Climb.—A hill-climb, limited to members of the Blackheath A.C. took place on Saturday last, the 8th inst., at Moat Hill, Ightham. The cars were handicapped according to bore of engine, and weight of car with passengers, upon the basis of the formula used by the Midland A.C. at their hill-climb in June. The place, according to formula, and speed of the best six cars up the hill (about one-third of a mile), giving an average gradient of about 1 in ten, was as follows:—

1st ...	T. Marshall ...	De Dion ...	12.3 miles per hour.
2nd ...	E. H. Fraser ...	De Dion ...	9.3
3rd ...	S. T. Norfolk ...	Comet ...	10.5
4th ...	W. Whiteway ...	Regal ...	14.4
5th ...	S. D. Graves ...	Darracq ...	15.3
6th ...	E. W. Stabb-Johnson	Star ...	11.4

South Wales Hill-Climb.—A hill-climbing competition, organised by the South Wales A.C., took place at the Buttrills, Barry, last Saturday, when thirty-seven cars took part. The hill rises for about 500 yards with a gradient from 1 in 9 to 1 in 11. The following were the results:—Amateur drivers—1, G. S. Seccombe's 12-h.p. Wolseley; 2, F. C. Shackell's 10-h.p. Gladiator; 3, C. H. Bailey's 28 to 36-h.p. Daimler. Professional drivers—1, G. S. Seccombe's 12-h.p. Wolseley; 2, C. E. Evans's 12-h.p. De Dion; 3, Gibbon Brooke's 6-h.p. Wolseley. Open event—1, G. S. Seccombe's 12-h.p. Wolseley; 2, Gibbon Brooke's 8 to 10-h.p. Humber; 3, Parker Thomas's 10-h.p. Talbot. The Bailey Trophy for the most meritorious performance was won by G. S. Seccombe.

Vanderbilt Cup Course.—The change proposed in the course for this race in October will reduce the "circuit" to 22 miles, which will necessitate 14 laps to make up the minimum distance of 300 miles under the rules. The new route, although more hilly than the old one, however, would ensure a non-stop race, as no controls would be necessary. The sanction of the Long Island authorities has been given for the race on October 11th, but the choice of the circuit is not yet decided, but the proposed changes are, starting from New Hyde Park, the first part is along the Jericho Turnpike (7 miles), over which last year's race was started and finished; then turning north, instead of south, as last year, to East Norwich (5 miles); thence to the left along the North Turnpike to Bull's Head Hotel (5 miles), at which point, turning

again to the left, down south past the Vanderbilt, Jr., estate, again reaching New Hyde Park (5 miles). The roads are sinuous and narrow for about 8 miles, whilst about 14 miles will allow good speeds to be developed.

Ostend Motor Week.—In fine weather the programme of this fixture was opened on Monday, when the event of the day was the Flying Kilometre for Racers and Tourist cars. In the former Rigolly, on his Gobron, came out at the top with 21 $\frac{3}{4}$ s., and in the Tourist Class, Baron Jochem's 60-h.p. Mercedes was first in 37s. No new records were established, except in the bicycle class. In this class Cissac, on a Peugeot machine (50 kilogs.), was timed for 28 $\frac{1}{8}$ secs. (= 127.65 k.p.h.), and Guipponi, on a similar machine, for 28 $\frac{3}{8}$ secs., both these therefore beating the world's record made by Lanfranchi at Dourdan, also on a Peugeot machine, of 29 $\frac{1}{8}$ secs. The chief times accomplished were:—

Racers.

- Heavy Cars.*—1. Rigolly (Gobron), 21 $\frac{3}{4}$ secs. (= 166.66 k.p.h.); 2. Wagner (Darracq), 23 $\frac{1}{4}$ secs. (= 155.72 k.p.h.).
Light Cars.—1. Touloubre (Darracq), 29 $\frac{3}{8}$ secs. (122.4 k.p.h.); 2. Renonce (Gregoire), 40 $\frac{1}{8}$ secs. (88.67 k.p.h.); 3. Civelli (Gregoire), 47 secs. (76.6 k.p.h.).
Motor Bicycles under 50 kilogs.—1. Cissac (Peugeot), 28 $\frac{1}{8}$ secs.; 2. Guipponi (Peugeot), 28 $\frac{3}{8}$ secs.; 3. Max (Minerva), 40 secs.
Motor Cycles over 50 kilogs.—1. Guipponi (Peugeot), 29 $\frac{3}{8}$ secs.; 2. Pilette (De Dion trike), 43 $\frac{1}{8}$ secs.

Tourist Cars.

- Cat. 1. Chassis under 5,000 francs.—1. 7-h.p. Oldsmobile, 1 min. 32 $\frac{1}{4}$ secs.
 Cat. 2. Chassis under 8,000 francs.—1. 12-h.p. Unic, 1 min. 19 $\frac{1}{8}$ secs.
 Cat. 3. Chassis under 9,000 francs.—1. 24-h.p. Vivinus, 58 secs.
 Cat. 4. Chassis under 12,000 francs.—1. Gardner-Serpollet, 43 $\frac{1}{8}$ secs.; 2. 18-h.p. Darracq, 52 $\frac{1}{8}$ secs.; 3. 18-h.p. Darracq, 56 secs.
 Cat. 5. Chassis under 15,000 francs.—1. 24-h.p. Germain, 51 $\frac{1}{8}$ secs.; 2. 24-h.p. Radia, 54 $\frac{1}{8}$ secs.; 3. 24-h.p. Radia, 56 secs.

Mechanical versus Horse-drawn Traffic.—So much has been said about the rights of the owners of horse-drawn vehicles upon our roads that Mr. S. F. Edge has had a census taken of all the vehicles passing along the Bath Road through Hounslow from 9 o'clock in the morning till 9 o'clock at night on July 2nd last. Here is the result:—

Cycles	4,577
Motor vehicles	557
Electric trams...	407
Horse vehicles	209
			<hr/> 5,750 <hr/>

These figures are a very interesting and complete refutation of the impertinent assumption of the owners of hippomobiles that they have superior rights to our highways. Here, out of 5,750 vehicles passing in 12 hours, there were only 209 horse-drawn conveyances. Comment is needless.

Hiring Out Cars.—It is doubtless only a matter of common law, but the case of Mr. J. Hextall and a London motor car firm has a certain amount of importance in connection with automobilism, owing to the increasing amount of business done in hiring out cars for short periods. Mr. Hextall had engaged a car to take him and a party of friends out for the day. He

- Cat. 6. Chassis under 17,000 francs.—1. Two Rochet-Schneider cars, dead heat, 40 $\frac{1}{8}$ secs.; 3. Rochet-Schneider, 44 $\frac{1}{8}$ secs.
 Cat. 7. Chassis under 20,000 francs.—1. Germain, 44 $\frac{1}{8}$ secs.; 2. Radia, 46 secs.; 3. 40-h.p. Brouhot, 47 $\frac{1}{8}$ secs.
 Cat. 8. Chassis under 30,000 francs.—1. Darracq, 41 $\frac{1}{8}$ secs.
 Cat. 9. Chassis over 30,000 francs.—1. 60-h.p. Mercedes, 37 secs.

On Tuesday the 10-kilom. event for racing cars and 5-kiloms. for tourist cars took place, the categories being the same as on the first day.

On this day several records fell. Wagner, with his French Eliminating Darracq racer, covered the 10 kilometres, standing start, in 4m. 8s., beating Rigolly's previous record on a Gobron of 4m. 39s. Baron Jochems, in the tourist class, with his 60-h.p. Mercedes, lowered De Cater's time over the 5 kilometres by $\frac{2}{8}$ s., and Guipponi, in the motor bicycles, put up 5m. 9 $\frac{3}{8}$ s. for the 10 kilometres. The chief times were:—

Racers, 10 kiloms. Standing Start.

- Heavy Cars.*—1. Wagner (Darracq), 4 min 8 secs. 2. Rigolly (Gobron), 6 mins. 32 secs.
Light Cars.—1. Touloubre (Darracq), 5 mins. 18 $\frac{1}{8}$ secs. 2. Civelli (Gregoire), 6 min. 8 secs.
Motor Bicycles under 50 kilogs.—1. Guipponi (Peugeot), 5 min. 9 $\frac{3}{8}$ secs.

Tourist Vehicles, 5 kiloms.

- Cat. 1. 1. 7-h.p. Oldsmobile, 6 mins. 34 secs.
 Cat. 2. 1. 12-h.p. Unic, 5 min. 37 $\frac{1}{8}$ secs.
 Cat. 3. 1. Darracq, 4 min. 6 $\frac{1}{8}$ secs. 2. Vivinus, 4 min. 19 $\frac{3}{8}$ secs.
 Cat. 4. 1. Fiat, 3 min. 51 secs. 2. Darracq, 4 min. 11 $\frac{1}{8}$ secs.
 Cat. 5. 1. Germain, 3 min. 50 $\frac{1}{8}$ secs. 2. La Buire, 4 min. 6 $\frac{1}{8}$ secs. 3. N.A.G., 4 min. 10 $\frac{1}{8}$ secs.
 Cat. 6. 1. Rochet-Schneider, 3 min. 17 $\frac{1}{8}$ secs. 2. Rochet-Schneider, 3 min. 25 secs.
 Cat. 7. 1. Brouhot, 3 mins. 25 secs.; 2. Germain, 3 mins. 29 $\frac{1}{8}$ secs.
 Cat. 9. 1. 60-h.p. Mercedes, 2 mins. 52 $\frac{1}{8}$ secs.

On Wednesday, the Tourist Trial over 240 kilometres, starting from Ostend, was the programme, and on Thursday, the standing mile on the Snaeskerke Road.

paid two guineas deposit on it, and it was agreed the car should arrive at 9 a.m. The car did not turn up till 11 o'clock, so Mr. Hextall sent it back again, and sued the company for the return of his deposit and damages, both of which he obtained, the latter to the amount of £2. The defence set up was that the car did not belong to the defendant company, but to a private owner, who had garaged it with them, and that the order was taken by a man who was in no way connected with the company.

Vulcanisers for Tyres.—The difficulties of effecting satisfactory repairs to tyres are, as every motorist will admit, exceedingly great, and, when it is necessary to send away the tyre for repair, very annoying as well. We have already had occasion to draw attention to a device by which it is possible to effect most repairs in the garage, and the same firm (Harvey, Frost and Co.) who introduced this vulcanising apparatus last year have now brought out a smaller *portable* plant designed so that it may be carried on a car. This "Car" vulcaniser—as it is styled—measures 9 in. by 6 in. by 6 in., and weighs less than 20 lbs., so that it cannot be considered an exceedingly bulky object even in the limited space at disposal on most motor cars. Messrs. Harvey, Frost and Co. claim that an inner tube can be effectively repaired in less time than is required by ordinary means, and that it is possible with their device to successfully deal with bursts which could not be patched at all.

CLUBS AND ASSOCIATIONS.

HEREFORDSHIRE AUTOMOBILE CLUB.—Meet of the members at the Moor, Hay, last week, upon the invitation of Mr. H. Graystone, after which the run was continued to Brecon and back.

Automobile Association.—The first general meeting of this newly-formed Association was held at the Trocadero on Monday evening last, when Mr. Charles Temperly again presided. A committee was appointed, which included Mr. Charles Temperly, Sir Archibald Macdonald, Lieut.-Col. Mark Mayhew, Messrs. Charles Jarrott, S. F. Edge, and Colonel Bosworth. Various matters of constitution and trade representation were discussed, and upon the motion of Sir Archibald Macdonald a vote of thanks was passed to Mr. Cowley Lambert for the course he publicly adopted in condemning from the Guildford Bench the biased judgments and unjust sentences which are so frequently passed upon motorists by magistrates throughout the country.

The Secretary of the new Association is Mr. E. A. Bowen, of 45, Great Marlborough Street, W.

Ladies' Automobile Club.—One of the best attended of the club meets this year was, perhaps, that at Lady Beatrice Rawson's beautiful country place, Woodhurst, near Crawley, when Lady Beatrice personally received her guests. The members of the East Surrey A.C. had been invited by Captain Rawson for the same day as the members of the club of which Lady Beatrice is a vice-president, and altogether some ninety motorists and their friends accepted the invitation.

Lincolnshire A.C.—Dr. Gilpin's annual picnic to the members of the Lincolnshire A.C. took place last Saturday in Grimsthorpe Park by the courtesy of Lord Ancaster, the Red Deer Park being selected for the occasion. In order to make the gathering one of more than passing interest, some excellent competitions were provided. About twenty cars carrying about one hundred guests attended, and the competitions which took place, after a very enjoyable *al fresco* tea, were attended by a considerable number of onlookers. The speed-guessing events created considerable amusement. In the spectators' competition, Mr. W. S. Foster, of Lincoln, proved the winner, the Rev. M. C. Wilkins, of Croft, being second best. The motorists subsequently were also tested for guessing speed on their own cars over a measured mile. In this the winner was Mr. H. Marshall, of Gainsborough, and Mr. C. W. Pennell, of Lincoln, second. A speed match over a mile distance was subsequently arranged between Mr. H. Newsam, of Lincoln, and Mr. W. Younger, M.P.'s 6-cylinder Napier, the times respectively being, for the Daimler, 1m. 39½s., Napier, 1m. 50s.

WHAT one motor can mar, another can sometimes mend. At any rate this was the case with the mails which on last Saturday evening were being conveyed from Brecon to Abergavenny. The motor omnibus broke down, and the officials were just wondering what they would do with the mails, when Captain Morgan, of Pontwell Hall, drove up on a powerful Daimler motor

Manx A.C.—Tynwald Day was selected for the second run of the season to Kirby by members of this club. A goodly company assembled upon the occasion, including the president, Mr. G. Drinkwater, with his family, in his White steam car; Dr. Sugden, of Ramsay, on a Wolseley; Mr. J. Daly (Darracq); Dr. Teare, of Castletown (Wolseley); Mr. T. Moore, Billown (Argyll); Mr. Leigh, Port St. Mary (Horbick); Mr. Mylchrees, of the Yorkshire A.C. (Lanchester), who was accompanied by the hon. secretary of the club; Mr. and Mrs. Caparu, Port St. Mary (Riley tri-car); and Mrs. A. E. Hunt (Lanchester).

Motor Union Meet at Chester.—To-day, Saturday, the Motor Union is holding the third and last of its this year's inter-club meets by the invitation of the Duke of Westminster at Eaton Hall, the meet being followed by a Motor Union dinner at the Grosvenor Hotel, Chester. Eaton Hall, the celebrated Cheshire seat of the Westminster family, is, as a general rule, rigidly closed to automobiles, so that the present opportunity afforded to the members of the Union should be specially appreciated. The meet at Eaton Hall is arranged for 3.30 in the afternoon, and it must be understood that no cars will be admitted without the production of a pass, which members can obtain at the Grosvenor Hotel, Chester. They are then to leave Chester by the Dee Bridge, and pass through the village of Handbridge to the Eccleston Gate of Eaton Park. Afternoon tea will be partaken of at the Iron Bridge near the Hall at 4.30, after which the members will return to the Grosvenor Hotel, Chester, for the dinner at 7.30, at which the Hon. Arthur Stanley, M.P., Chairman of the Union, will preside. The meeting should prove especially interesting to all who attend, as in addition to the attractions of Eaton Hall, Chester is the most picturesque and quaint old town in the United Kingdom. It is, as many people will remember, still enclosed by the old mediæval wall, and is full of houses of the black and white Cheshire type, often beautifully carved, dating from the 15th and 16th centuries, among which "God's Providence House" is perhaps the most noted. In Charles the First's time it was triumphantly held for the crown for a long period by the Byron of that day. It may be of interest to any members that intend to proceed to Chester by railway to know that week-end tickets are not issued by the L. & N.W. Railway to the town itself, but they can be obtained to Rhyl, which is but a little further down the line.

car with a party of officers on board. He at once undertook to take the mails on, and collect the mails and passengers *en route* to Abergavenny railway station. Although Captain Morgan started twenty minutes behind time, he accomplished the journey successfully, and arrived at the station twenty minutes before the schedule time.

MOTOR CYCLING.

Motor Union of Ireland Hill-Climb.—The Dublin centre of the Motor Cycle Union held the first hill-climb of the season on Saturday last. The event was decided at Glendhu, co. Dublin, over the course usually selected by the Irish Automobile Club for their annual contest, the distance being increased from $\frac{1}{4}$ of a mile to $1\frac{1}{2}$ miles. The event was confined to members, but open to any type, make, or class of motor cycle, irrespective of weight or horsepower. Two sets of prizes were awarded, one on the time and the other on a handicap; the former was won by A. Summers, who

MOTOR BOATING.

Motor Boat Fixtures.—The racing programme for the 1905 season, which has been arranged at the conference between the Motor Yacht Club and the British Motor Boat Club, promises some excellent sport during the next two months. These will embrace meetings as follows, entries in each case closing three days before the actual race meeting :—

July 25-26.—Races at Plymouth (M.Y.C.).
 „ 26.—Garden Party and Motor Boat Gymkhana (B.M.B.C.).
 August 1.—Sea View Races (M.Y.C.).
 „ 2-3.—Southampton Motor Races (M.Y.C.).
 „ 7.—Races in the Solent (B.M.B.C.).
 „ 8.— „ „ „ (M.Y.C.).
 „ 9.—Southampton Water (B.M.B.C.).
 „ 10.—Cowes (B.M.B.C.).
 „ 11-12.—Solent (M.Y.C.).
 „ 15-16.—Ryde (B.M.B.C.).
 Sept. 20.—Burnham-on-Crouch (B.M.B.C.).

A SUCCESSFUL trial run has been made by the Pioneer, a new motor fishing boat which has been acquired by the Congested Districts Board of Scotland, and is also controlled by the Scotch Fishery Board. She has run round from the Fife coast to the Custom House below London Bridge, and completed her experimental trips by a run down the river. The motor boat was fitted with the Dan type of motor, which consumes ordinary paraffin oil, and enables the boat to develop the speed of three knots an hour in perfectly calm weather, when the sails do not draw at all.

At the Maidenhead Regatta a regulation was promulgated that no petrol or motor spirits should be poured from one receptacle to another on the river, and that every motor boat should be provided with a quantity of dry sand for extinguishing petrol flames.

It has been announced by the Prime Minister that the inquiry to be held into the working of the Motor Car Act is to take the form of a Royal Commission.

MOTOR CYCLE UNION OF IRELAND.—A snap at the Hill-Climb on Saturday last. A real test hill. Alf. Summers on 3-h.p. Triumph (winner of Class I. and second in Class II.).

covered the course on a 3-h.p. Triumph in 3m. 22s.; C. B. Franklin being second, and L. D. Horty, on a 4-cylinder F.N., being third. The handicap worked out in favour of Franklin; Summers second, and Hewison third. The following are the times taken by Messrs. T. W. Murphy and Colman O'Connell :—

			m.	s.
1.	A. Summers	3-h.p. Triumph	3	22
2.	C. B. Franklin	2 $\frac{1}{2}$ -h.p. F.N.	3	23 $\frac{1}{2}$
3.	L. D. Horty	4-cylinder F.N.	3	54 $\frac{1}{2}$
4.	L. Summers	3-h.p. Triumph	3	57 $\frac{1}{2}$
5.	H. E. Alfred	3-h.p. Singer	4	25 $\frac{1}{2}$
6.	T. T. Hewison	2 $\frac{1}{2}$ -h.p. F.N.	4	39
7.	P. S. Sheardown	3-h.p. N.S.U.	4	51 $\frac{1}{2}$
8.	W. Guilfoyle	2 $\frac{1}{2}$ -h.p. Liberty	5	7 $\frac{1}{2}$
	A. E. Bannister	2-h.p. Minerva		(retired).

DURING the Brighton Race Week the Michelin Tyre Company, Limited, have arranged with their agents, the Brighton and Sussex Motor and Carriage Works, Limited, 29, King's Road, and 13A, Cannon Place, Brighton, to have a large stock of Michelin tyres and accessories on hand, so that motorists will be able to obtain any spares they may require.

THE growing importance of the home industry and the value of the business to be done by an enterprising and capable firm is attested by the recent progress of which the Argyll Motors, Limited, of Glasgow, send us some particulars. During the last quarter, ending with the midsummer quarter-day, the firm manufactured and delivered 220 cars. This output represents some £80,000 and 3,000-h.p. On the last day of June, a special train carrying nothing but Argyll cars was chartered to convey their output to Carlisle. The Company have laid down new works, which will be rapidly completed, and these, which will be fitted with every modern convenience, will cover some 11 acres of floor space. The principal building is an imposing structure, some 550 feet long and two storeys high, built of red Dumfriesshire sandstone with a Peterhead granite basement and entrance hall. This building contains a large hall capable of accommodating 500 people, which will be used for meetings of the employees. A lecture room, ambulance rooms, and refreshment rooms for the staff and different departments are provided. When the new works are in full swing, the Company anticipate turning out upwards of 2,000 cars per annum.

H.M. King Edward's latest acquisition—a 40-h.p. Mercedes Car. The carriage which has just been completed by Messrs. Hooper, the well-known carriage builders, is perfectly fitted throughout. The wheel base is 10½ feet, a table is placed in the spacious body, electric light is fitted, and every convenience that can lend comfort in long-distance travelling is embodied in the finished car.

NOTHING which has recently occurred in connection with the automobile movement can be considered to be of greater importance than the proposed Royal Commission into the working of the Motor Car Act. It is most important that the case of motorists should be placed before the Commission as strongly as possible, and all car owners or others who have either been themselves the victims of flagrant injustice, police persecution, magisterial incompetence or prejudice, or hostility on the part of the general public, should, in the interests of the movement, communicate such facts as they can support by evidence, either to the Automobile Club or to the Motor Union. The Automobile Club, of course, will be recognised as the official spokesman of motorists throughout the United Kingdom, and any useful suggestions for the amelioration of the Act that may occur to anyone should be communicated to the Legislative Committee of that body.

The Results of Local Dilatoriness.—The Chertsey District Council are still at work on the bridge over the Wey at Byfleet. The work, which might have been done, according to expert estimates, in a fortnight, has been in progress for upwards of six weeks, and shows little signs of approaching completion. In the meantime, all the traffic has to go through the river in what is called a "water splash" (at its own risk, the Council is particularly careful to point out). The above photograph shows a Wolseley car in the act of crossing the Wey at this point, an experience more suggestive of South Africa, it must be admitted, than of "Christian" England.

THE Colonists of South Africa are looking forward to the general introduction of the alcohol motor with much interest, as it is anticipated that the demand for colonial alcohol which would result would have a very beneficial influence on the agriculture of the Colonies.

SCARBOROUGH church parade on the Esplanade is a feature of this highly-popular seaside resort. Strangely, an agitation has sprung up to exclude motor cars from this function, a few rabid anti-motorists alleging that the attractiveness of the parade is destroyed by the presence of automobiles.

Crossing the Wey at Byfleet.

The recent Scottish Reliability Trials have been the means of a large number of orders being placed for cars which did well in this trying ordeal. The photograph which we give above is of a 20-h.p. Ariel, a sister of the one which gained the Gold Medal in these Trials. This has been specially built to the order of Mr. C. Russell Gray, of Monmouth, and adds one more to the beautiful British cars which are so rapidly getting on the road throughout the whole country.

MEMBERS of the Huddersfield A.C. on Saturday took 54 patients of Huddersfield Infirmary, in charge of Dr. Horsfall, the matron, and 20 nurses, in 27 motor cars, to the Moors, where tea was provided.

MR. CATHCART WASON has been writing to the papers in support of his proposal to impound cars in the case of offences against the law, committed by their drivers. But we cannot say that he makes out much of a case. He does not attempt to meet the injustice that would arise when an offence is committed by a driver whose employer is not on the car with him.

A VERY serious accident occurred last week to a car belonging to Baron Henri de Rothschild on the Auvergne course. The Baron had established a regular medical encampment just off the circuit road, and the car was being taken back by two of his chauffeurs. Careering down a long stretch of road with a bad corner at the bottom at some 50 miles an hour or more, they attempted to take the corner, but suddenly the car skidded, colliding with a stone parapet, and was literally smashed to bits. A female occupant of the car was thrown with her head against a wall and killed instantly. The driver was hurled against a barrel of anti-dust mixture with such force that his head penetrated the timber and received a dressing of that material, and he died some hours later. The other two occupants of the car are dangerously, but, it is hoped, not fatally injured. The accident, which was witnessed curiously enough by both Baron de Caters and Jenatzy, is a shocking

example of the kind of thing that sometimes happens when irresponsible professional drivers are permitted to gallivant about on a car without any supervision.

MR. WHARTON, M.P., who was one of the principal speakers at the Harrogate Habitation of the Primrose League, in the course of a long speech said that he never encountered such unanimity as now prevailed to restrain the ardour of those motorists who seemed to him to live to break the law. He again put forward his proposals that great increase of duty should be made in the case of high-powered cars. Up to 12-h.p. Mr. Wharton would be graciously pleased to allow them to pay the same contribution as they now make to the revenue, but over 12-h.p. he would inflict a duty of £1 per h.p. per annum. We are all in accord with Mr. Wharton that something must be done to stop the road hooligan, though even he can hardly be said, we think, to live only to break the law.

ANOTHER case has been dismissed by a magistrate, this time at Stockport, owing to the crude methods of timing adopted by the police. So it is interesting to note that someone has found out, or re-discovered, the fact that the old-fashioned egg-boiler—the three minutes sand-glass—works beautifully on a motor car, and is more accurate than most police stop-watches. All you have to do is to carry one of these time-honoured inventions with you and keep your eye on the milestones. Start your egg-boiler when you see a milestone, and if you do not pass a second milestone before the sands are run out, you know you are not exceeding the legal limit. If there are no milestones you will probably write subsequently to the inventor, so we do not give his name.

Built specially for use in India, the 25-seated char-a-banc shown above has recently been completed by Messrs. J. W. Brooke and Co., for shipment to Bombay. It has a four-cylinder engine of 15-20-h.p. a four-speed change-gear of the sliding spur-wheel pattern, and is of the chain-driven type. Solid rubber tyres of the well-known Sirdar make are fitted, those on the back wheels being of the twin type. The teak body has a strong canopy to carry luggage, curtains to protect the passengers from the weather, and a glass screen in front. This useful car is geared to run at any speed up to 20 m.p.h., and has, we learn, proved easily capable of taking 30 people up a gradient of 1 in 8.

Lubricating Oil for Petrol Engines.—Every motorist knows, or soon finds out, how important it is to get a suitable oil for his engine, and it is not altogether surprising that such a firm as De Dion Bouton, Limited, should have placed a new brand of oil upon the market under their own name. That the oil they are now able to supply should have only been evolved as the result of most extensive tests will, of course, be taken for granted by all who know the thoroughness which is characteristic of the firm. In an interesting pamphlet which they have drawn up on the subject of these tests, it is pointed out that none of the ordinary oils formed by a mixture of American and Russian products had, when tested, a sufficiently high flash-point to render them satisfactory, and that pure American oil, therefore, formed the basis of all further investigation. During one series of tests extending over half an hour, it was found that the 12-h.p. engine developed $3\frac{1}{2}$ electrical h.p., more, when lubricated with the De Dion oil, than could be obtained from it when using the next best oil on the market.

British Exports and Imports of Motor Cars, &c., for 1905.

NOTE.—For 1904 comparative figures see full table for the year in our issue for January 21st, page 91.

COMPANY DOINGS.

NEW COMPANIES REGISTERED.

Motor Yacht Club Proprietary (Limited), 18, Down Street, Piccadilly, W.—Registered with 20 members, each liable for £1 in the event of winding-up.

Newton, Bennett, and Carlisle (Limited), 35, King Street West, Manchester.—Capital, £25,000 in £1 shares (10,000 six per cent. preference). Object, to acquire and amalgamate (1) the business of a motor car dealer and agent carried on by J. Newton, at 35, King Street West, Manchester, and (2) the similar business carried on by Bennett and Carlisle (Limited), at 239 and 241, Deansgate, Manchester. First directors, J. Newton (managing director), J. A. Bennett, R. H. Carlisle, R. Newton, and W. Kay, J.P.

T. and R. Young (Limited).—Capital, £1,000 in £1 shares. Object, to acquire the business carried on at 12 and 14, Semley Place, Eason Square, S.W., by T. H. Schultess-Young as Martin's Motor Mart and Garage, including the Pall Mall cycle business, formerly carried on by the Wilkinson Sword Company, Limited. T. H. Schultess-Young is permanent managing director.

Motor 'Bus Progress.—At an extraordinary meeting of the London Motor Omnibus Company, Limited, an increase in the Company's capital from £103,000 to £303,000, by the creation of 40,000 6 per cent. Cumulative Preference Shares of £5 each, was authorised. Mr. A. T. Salisbury Jones, the chairman of the Company, stated that their now well-known "Vanguard" service from Brondesbury to the Law Courts was running most successfully. The receipts since they first started on March 28th have been consistently good from the first day, the aggregate average earnings per mile showing a steady and uninterrupted increase. The average takings per mile to date were better than those of the first week by upwards of 2d. per mile. In April, 212,250 passengers were carried, the takings being £1,170. In May, 308,462 passengers were carried, the receipts amounting to £1,937. In June there were 591,745 passengers, and receipts were £3,666. In all 1,100,000 passengers had been carried up to July 1st. It was announced that a working arrangement had been come to with the London District Motor 'Bus Company, in order to avoid competition and friction, this arrangement, it was considered, being to the advantage of both the Companies. Although the authorisation of the capital increase was sanctioned, it was announced that there was no intention to make any issue of these Preference Shares at the moment, but that it was deemed advisable to have the power to do so when requisite, without waiting for the delay which might ensue in calling a special meeting for the purpose. The chairman stated that he thought he could promise that before the end of the year the directors would be able to declare an interim dividend.

The Motor Pneumatic Tyre Company (Limited), prospectus is to be issued next week. The capital is £150,000. The formation of the company is mainly for the purpose of acquiring the Seddon motor tyre patents which have been now for some time so well known. A strong Board of Directors appears in the prospectus, and strikes us, moreover, as being a particularly practical one, whilst the company will start being able to supply their goods forthwith under a special contract, of which they will get the benefit, with Messrs. David Moseley and Sons, Limited, of Manchester, for the manufacture of their special tyres. A speciality of the Seddon tyre, as worked by this company, will be for motor omnibuses and other heavy road motor vehicles. The company also obtain control over the patents for the United States of America, the French and the Belgian patents.

COMMERCIAL POINTS.

As showing how inexpensive a light car may be, if well made in the first place, and intelligently cared for in the second, the experience of Dr. Dowse, M.D. Dub., L.R.C.S.I., with his 6-h.p. De Dion is instructive. He has had this car since June 3rd, 1904, has always driven it himself, and it has been kept oiled and cleaned by his indoor servant. During the year, the car has covered a distance of 3,236 miles at a total cost, including petrol and lubricating oil of £10 0s. 4d. (under 3d. per mile). The only involuntary stop was for a broken wire at the sparking-plug, and the only repairs (costing 24s.) were two new spring-leaves, to replace those broken by travelling over exceptionally rough roads. Dr. Dowse is naturally extremely satisfied with his experience as a motorist, particularly as he has never had a puncture and has never found it necessary to tighten a bolt.

UNDER the title of the Mutual Motor Car Assurance Association, Messrs. Ernest Schofield and Geoffrey Smith advise us they are forming an association for the purpose of assuring motor cars under private ownership whilst employed in a reasonably careful manner, and in a private capacity, in any part of the United Kingdom. The address of the proposed Association is 32, Sackville Street, W.

THE MOTOR CAR CO. (1905) LTD., have opened their ground floor premises at 168, Shaftesbury Avenue as a depot for the sale of second-hand cars. The system employed by the Company is to have each car examined by experts, and to give written certificates to the ultimate purchaser of each vehicle. The Company have also arranged for their garage to be open day and night with a com-

petent staff in attendance, a stock of accessories and spare parts, motor spirit and lubricating oils being always at hand. This branch of the Company's business is in the hands of Mr. Harry Nelson, who for some time has been well known in the automobile trade.

AN interim dividend of 6 per cent. on the Preference Shares and 25 per cent. on the Ordinary Shares of Friswell, Limited, has been declared for the half year ending June 30th, 1905.

DE DION BOUTON cars appear to be maintaining their good reputation for reliability in Australia. Besides securing first and second place in the Sydney-Melbourne event, Mr. E. Norton Grimwade, on a 10-h.p. De Dion car with 4-seated touring body, in a 100-mile non-stop trial at Melbourne, has just, we learn, obtained full marks. The car ascended 1,800 ft. at an average speed of 25 miles an hour the whole journey, and used 4 gals. of petrol.

PRINCE ARISUGAWA of Japan, at St. James's Palace, after inspecting and testing a 30-h.p. Darracq car on Saturday last, concluded by becoming its owner. One of the Legation secretaries informed Mr. Beardwood, the representative of Messrs. A. Darracq and Co., that owing to the scarcity of horses in Japan due to the war, there was a big opening for motor cars there. The car is at present being got ready for shipment by the Darracq Company at their Oxford Street premises, and can be inspected by anyone interested in same.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E. Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

17729. 15th August, 1904. Improvements in Tractors for Agricultural Purposes. E. A. Taine, 26, Rue Hamelin, Paris. The object of this invention is to increase the adherence to the ground whatever the weight of the tractor or the nature of the soil. For this purpose an endless chain is placed round the wheels of the tractor, which are provided with sprocket teeth. The chain forms a continuous rail, having links provided with blades or teeth adapted to successively engage the surface of the soil as the tractor advances, so as the better to overcome the resistance of the agricultural machines drawn. There are eight figures. Fig. 1 is an elevation of the tractor, parts of it being diagrammatical. The frame, *a*, is carried on the springs, *b*, on a cross-frame, *c*, and the rear part of the frame on an axle, *d*. The steering-wheels, *e*, are mounted in vertical forks, *f*, each of which is pivoted to the end of the cross-frame, *c*, so that its vertical axis of rotation is in the line, *z z*, while the driving wheels, *g*, are

mounted to give a variable supply, its passages for air and liquid hydro-carbon being capable of a simultaneous and proportionate increase or decrease. The variation is effected by hand by means of a bell crank lever. There are two figures. The carburettor shown, Fig. 1, a part section, comprises a chamber, 1, containing petrol at a constant level and an air chamber, 2, closed at its upper part by a cover, 3 having an opening, 4, through which air enters the chamber. At the upper part of the chamber fits, 5, a conical or funnel-shaped piece, inside which a disc, 6, can be moved up and down by means of a bell crank, 7. The upper side of the disc, 6, has a hollow cylinder, 8, fitting and sliding smoothly within the lower part of the cone, 5, and surrounding a step cone, 10, fitting round the nozzle on the base of the chamber, 2. The cylinder, 8, is provided with ports, 16, for permitting the air entering by the passage, 4, passing into the cylinder, 8, whence it passes to the space, 17, and thence to the

consequently entirely unaffected by the suction stroke of the motor piston. If the disc, 6, be raised by means of the bell crank, 7, the air passage round the spraying nozzle, 11, not only increases as the disc rises, but at the same time the supply of petrol increases proportionately because the lower part of the tube, 18, uncovers successively the passages, 13, 14, which being then subjected to the suction created in the chamber, 8, come successively into operation. June 22nd, 1905.

loosely mounted on the axle, *d*, and have the same gauge and diameter as the steering-wheels. By this arrangement the steering-wheels, *e*, can be moved to the right or left for the purposes of steering without movement of the wheels themselves forward or backward. For simultaneously changing the direction of both wheels, *e*, levers, *h*, are used integral with the forks, *f*, and connected by a toothed rod or rack, *i*, sliding transversely. The rod is operated by means of the steering-wheel and rod, *j*, and the pinions, *k* and *m*. For guiding the floating link of chain over the wheel, *e*, two guide rollers, *n*, are used between which the chain passes. The chain is also kept comparatively tight by means of the weighted roller, *o*, fitted to an oscillating lever, *p*. June 22nd, 1905.

7834. 12th April, 1905. Improvements in Carburettors for Internal Combustion Engines. Louis Renault, 139, Rue du Print du Jour, Billancourt, Seine, France. Date under International Convention, 7th January, 1905. The object of this car-

suction pipe of the motor. The cone, 10, enables the passage from the cylinder, 8, to the space, 17, to be completely closed, but if the cylinder, 8, and disc, 6, be raised by means of the bell crank, 7, an air passage is obtained, the area of which is proportional to the lift, thus the quantity of air passing increases in proportion to the lift. The disc, 6, has at its centre a tube, 13, which passes through the cover, 3, and is open to the atmosphere through 10. The lower part of the tube, 18, is of reduced internal diameter, and slides smoothly over the spraying nozzle. According as the disc, 6, is more or less raised a greater or less number of outlets for petrol is uncovered and subjected to the suction produced in the cylinder, 8. In the lowest position the disc, 6, closes the air passage. The petrol outlet, 12, communicates with the inside of the cylinder, 8, while the other two passages, 13 and 14, for the petrol are covered by the tube, 18, and so communicate with the atmosphere through the opening, 19, and are

THE GLIDDEN CUP ROUTE.—A specimen of the scenery in the White Mountains which the competing cars traverse. A White Steam Car, seen in the picture, was driven over the difficult and rough route without any troubles arising. A series of the pictures obtained under these circumstances are published by us elsewhere this week in addition to the above charming photograph. The competing cars started from New Rochelle, near New York, on July 11th, and finish to-day (Saturday) at Yorkers, during which time about 900 miles were to be traversed, including the Bretton Woods and Mount Washington in the famous White Mountains. The run is in the nature of a "go as you please" touring car event, so long as "you get there." About 40 cars were entered for the start, including two to be driven by ladies.

PASSING EVENTS.

The Results of Incitement.

WHEN the Marquis of Queensberry and Canon Greenwell promulgated their suggestions that motorists ought to be shot at sight, we felt quite sure that had they realised that their remarks would be translated into action by some downright individual who did not possess the gift of humour, they would both have been highly shocked, and would have declared that such a suggestion involved a needlessly prosaic and alarmist view of the situation. But this is exactly what has happened. An inhabitant of the village of Bromley in Kent—a spot which is almost a London suburb—has taken these incitements literally, and discharged a rook rifle at the head of Mr. Alfred Hewett and some friends who were driving through Orpington on Friday last. The rook-rifle-motor-car-pepperer was ultimately taken into custody, and alleged, apparently in self-defence, that “they ran over my children and I shot at them.” He will, of course, be tried, so about his case we say nothing, and we do not particularly wish to see either the Marquis of Queensberry or Canon Greenwell in the dock as having incited to the outrage which has now been committed. But we would point out to them that under different conditions that is the place they might certainly have occupied. If they were at present living in Ireland, and had in equally clear and unmistakable language declared that a man who took a grazing farm ought to be shot, and if within a short time afterwards such a man had been shot, they would have found themselves in a very tight place indeed. When a staid ecclesiastical dignitary like a canon supports a popular nobleman in advocating recourse to the shot gun (whether in joke or not), it is not to be wondered at if the ordinary agriculturist, who is not usually gifted with much sense of humour, takes their advice a little too seriously.

* * *

Useful, However, for Practice.

THERE is a town on the west coast of Ireland which shall be nameless, where there once lived a member of the Irish constabulary who was called upon to despatch with a revolver—an indispensable part of the equipment of the R.I.C.—a stray cur which had been led before him for destruction. The representative of law and order took deliberate aim at the head of his victim, pulled the trigger, and shot off the last inch of his tail, after which he became so celebrated in the neighbourhood that he had to request his transference to another part of the country. We are reminded of this occurrence by the extraordinary story which comes to us from New York, where a policeman (who had been instructed to pull up recalcitrant motor cars which refused to stop when called upon to do so, by puncturing their tyres with a pistol) fired at the tyres of a passing motorist, and wounded the motorist in the thigh. This is the sort of thing that happens when in civilised countries either the authorities or others have recourse to brute force. They generally hit the wrong target. To make a bullseye on the wrong target is about the most humiliating misfortune that can occur to the marksman. At ordinary rifle practice the perpetrator is fined half-a-crown, but the New York policeman, it is to be hoped, will not get off quite so lightly as this.

The Report of the Royal Commission on London Traffic.

THE first volume of the Report of the Royal Commission on London Traffic has been published, and altogether it is quite in accordance with the previous unofficial statements which have been made in the Press, the principal proposals put forward being as follows:—

1. The creation of an authority or board with limited and special powers, having the general control of measures affecting locomotion and transport in London; such board being appointed by His Majesty's Government.
2. Extension of the tramway system and the linking up of north and south.
3. Absolute abolition of the veto now possessed by certain authorities to prevent the construction of tramways.
4. Further development of railways; railways in shallow subways being deemed preferable to “tubes,” where the cost is not prohibitive.
5. If private enterprise will not construct the necessary railways, the local authorities might be empowered to give assistance by remission of rates or direct contribution.

On the whole, the Report is a disappointing document. The organisation of the Traffic Board may do some good, and will, no doubt, provide comfortable posts for the people appointed to it. The general adoption of subways, particularly the great subways under Hyde Park and elsewhere which are proposed, will, in some ways, conduce to diminish traffic, and there is no doubt that the great thoroughfares that the Commission suggests, the so-called “main avenues,” would have a still greater effect in the same direction. Unfortunately, the Commission at the same time suggest that the commencement of these avenues should be postponed to the Greek Kalends, or to a time when London will be in a position to pay for them.

The most astonishing feature of the Report, however, is the extent to which it bows down before the electric tram, proposes an enormous extension of the electric tram system, and even suggests four electric tramlines running abreast on its ideal “main avenues” —when they are made. We have already dealt with the extent to which the indefinite multiplication of trams is likely to impede London traffic. After this it is not to be greatly wondered at that the attitude adopted by the Commission to the motor 'bus is not a very sympathetic one, as they are “of opinion that on routes suitable for tramways where there is a large traffic, tramways will continue to be the most efficient and the cheapest means of street conveyance, and they cannot recommend the postponement of tramway extension in London on the ground of any visible prospect of the supersession of tramways by motor omnibuses.” Well, of course, the Commission began their labours some time ago, and possibly the Report was practically finished before the recent demonstrations of what the motor 'bus can effect had been placed before the eyes of Londoners. But there was plenty of evidence of what it could effect long previously provided in provincial towns, and one might expect a Royal Commission to have some cognisance of the world generally, and not, as in Mr. Kipling's words, to imagine that “The empire stops at Charing Cross.” It is, therefore, with some surprise that we find the Commissioners have discovered such a distant fastness as Brentford, and have even animadverted on the state of traffic which regularly prevails in that unsavoury townlet. In spite of the Royal Commission's Report, we fear that things will be still allowed to “muddle along” much as they used to do.

D

The Brighton Race Meeting.

THE attention of the whole automobile world, at any rate, that portion of it which is interested in sporting events (and that of course means the great majority of car owners or producers), is this week concentrated on the Brighton Madeira Walk, where a huge number and a great variety of motor cars and motor bicycles are showing their maximum speed capabilities, to the great entertainment of the inhabitants. All possible praise must be bestowed upon the initiative of the Brighton Corporation and the admirable manner in which they and the A.C.G.B.I. have organised the meeting, and everyone will hope that the result will be satisfactory from every point of view as a commercial speculation for the town. There is no question that the Corporation deserves well of the automobile movement for the trouble to which it has put itself in arranging the meeting, and though we have felt it to be our duty to strongly question the wisdom of holding speed contests of this kind at the present juncture—when we may say without any exaggeration that the future of the automobile movement is about to be thrown into the Parliamentary melting-pot—it must be recognised that the large number of entries which have been registered for the Brighton events proves most incontestably that sporting events, in which car can compete with car and driver with driver, are greatly appreciated by the car owners or by car makers of the country, or by both these sections of the motoring community.

A Reason for Reflection.

THIS very fact should provide the strongest possible inducement for everyone interested in the automobile movement to thoroughly and carefully consider the situation. The Brighton and Blackpool meetings will no doubt go off this year without let or hindrance, even though, as we have already pointed out, they may leave some unpleasant effects behind them in the way of giving point to the arguments of enemies of the movement. But whether such meetings are wise or not, at the present time, it is quite certain that no far-seeing automobilist can look upon them, either at Brighton, Blackpool, or anywhere else, as being thoroughly satisfactory institutions, no matter from what point of view they are regarded.

Apart from the fact that such events are liable to have a very injurious effect on the industry by influencing future legislation adversely—as pointed out by us with special emphasis last week—the very multiplicity of winners, and the almost irritating sameness of most of the heats, are bound to detract from the interest that might otherwise be taken by the public, while, above all, the results of this type of race can never form a real guide as to the true relative merits of the competing vehicles, and therefore purchasers and makers alike are doomed to dissatisfaction, whether the event is regarded from a sporting or from a commercial point of view.

A Matter for Manufacturers.

It is naturally the makers who have most to lose by any retrograde legislation, and it is they too who have most to gain by fostering events of a sufficiently attractive kind to render them permanently popular, for not only will owners of their cars then gradually relieve them of the expense of taking an active part themselves, but those who build the best touring vehicles will benefit accordingly.

For this reason, therefore, we feel that manufacturers in particular ought to give their most careful attention to the elaboration of satisfactory rules for holding competitions and sporting events on the same or similar lines to those which we sketched out last week, and with which we are still dealing.

It is not as if racing events of the Tourist Trophy type would involve an increased expenditure. Any idea that the manufacturer will have to undertake an elaborate series of experiments, in order to successfully compete, is wholly mistaken. It is just as costly, for instance, to develop a form of carburettor that will give maximum power, regardless of efficiency or anything else, as it is to develop one that will give the most desirable all-round results for touring—not for mere racing—purposes. As a matter of fact, it would actually save money if the aims of the designer were identical, whether he wished to produce a car that would give the greatest satisfaction to the ordinary user, or whether his object were to supply the most suitable vehicle for competing in the various racing contests of the year. Look at it as one may, it should obviously be the policy of the manufacturer, even more than of the user, to see that the sporting side of the movement is directed into the right channel, and it is for him to take care that no important automobile competition in the future is the mere farce that many of them are now rapidly becoming. There is no time to be lost in grappling with the problem, for, otherwise, it will be too late to retain such interest as now prevails.

United Action Essential.

It is only if something like practical unanimity is attained that progress will be possible, and to attain this unanimity every real automobilist must consider the subject carefully and formulate proposals. We have already received a large number of letters on the subject, the first batch of which we propose to publish next week. The expression of views should be as wide and universal as possible.

It is a very burning question, and we most sincerely trust that our readers will not content themselves with a passive attitude, in which they merely agree with what we or others have said. They must take serious and active steps to promote unity and agreement if they are really enthusiastic on behalf of the cause.

The present proposals, as outlined by us in the special article devoted to the subject, amount to a classification of cars according to the power available (from the fuel), and their weight, while certain restrictions are imposed in order to eliminate all but *bona fide* touring cars from taking part in the race. Mere speed, which after all said and done is not what real touring cars are built for, is no longer made of supreme importance, but the car that stands the best chance of winning is that which is the fastest *in spite* of being the most reliable, durable, and efficient. Quite as important as the opinions of all motorists on the general issues at stake are the views of manufacturers as to what they consider might fairly be taken as the limits of weight, size, and fuel allowance for one or more standard types of car.

The Apotheosis of the Policeman.

It has long been said that good Americans when they die (and sometimes before that catastrophe occurs) go to Paris, and there is now reason to hope that a similar improvement in condition will overtake the functionary whom the Irish priest described as the “common policeman walkin’ the shreet,” at any rate when he retires from the police force; that is to say, he may become a

driver of a motor car. Such, at any rate, is the example which has been set by H.M. King Edward, who has selected his most recent driver, Henry Payne, from the ranks of the Metropolitan police force. Policemen are often excellent fellows when left alone by joint committees and other fussy functionaries, and we have no doubt that the ex-Metropolitan policeman will make His Majesty an admirable driver. In the meantime the appointment ought to open up a new vista to policemen of possible promotion in the future. We trust that from this point of view the diplomatic action of His Majesty, who has for some time past been recognised as the ablest diplomatist in Europe, will have the effect of imbuing the police with kindly feelings towards the form of locomotion towards which they are popularly supposed, at any rate in many instances, to cherish a special aversion.

♦ ♦ ♦ This Smacks of Priestcraft.

ONCE upon a time we were very enthusiastic about the Iveagh-Pirie scheme for regenerating Ireland by motor car and motor delivery van. The "distressful country," however, is a remarkably tough place to regenerate. The admirable scheme which has been elaborated for its benefit has been practically rejected by the County Councils. The Irish County Councils seem to nourish the same objection to the new locomotion, and to all the benefits which the country might derive from it, as our forefathers did to the old steam cars, and they are combating them with the very same weapon—the inability of their bridges to stand the traffic. That is what they allege, and they have refused to go to the necessary expense for strengthening the bridges and improving the high roads. It is a fatuous policy, and anyone who knows Ireland will not be long in fixing upon the sinister influence which dictates it. There is a powerful class in the country, not inaptly characterised by the poet Béranger, as

"Des autres nains tous noirs,
"Dont mon nez craint les encensoirs."

These gentlemen are greatly afraid of the enlightening effects which modern progress, particularly mechanical progress, may produce in their special sheep-fold, and they have a tremendous influence on the County Councils.

♦ ♦ ♦ Sir Ralph Payne Gallwey as Ulysses.

WE had not hitherto imagined that there was much resemblance between Sir Ralph Payne Gallwey and Ulysses. But if Sir Ralph does not share the proverbial wisdom of the hero, it seems that he can to some extent lay claim to rivalling him as a wielder of the bow. He possesses an extraordinary Turkish bow, said to be 200 years old, and with this he shot three arrows into a space 18 yards by 10 yards, the furthest travelling a distance of 367 yards. The previous archery record in this country is believed to be 340 yards. Sir Ralph Payne Gallwey was the original suggester of the proposal of stopping motorists by firing at their tyres, a process which has led to such a lamentable misfortune in the neighbourhood of New York. Should he emerge upon the high roads armed with his Turkish bow, with a quiver in which "the arrows rattle on his shoulder as he goes along raging at heart," and form a picturesque addition to some of our well-known police traps, such a proceeding will be in thorough keeping with the attempt to put back the hands on the clock of progress with which Sir Ralph Payne Gallwey, Mr.

Cathcart Wason, Mr. Soares, and that "Mons Meg" of our northern counties Canon Greenwell, and others of his sympathisers have identified themselves.

♦ ♦ ♦ Bookmaking Up-to-Date.

THE humourists at Spring Gardens are continually occupied in preparing further delightful surprises of a Gilbertian nature for their constituents. They seem to be determined on making a corner in practical joking. At least this is the only conclusion to which one is led by the *Standard's* account of their most recent "*magnum opus*," the County of London Drivers' Licence. The work in question consists of 8 pages duly bound and gold lettered. The first page is the licencing form, which is practically the same as that previously in use, except it would appear that the licensee is not required to append his signature, while the other 7 pages—left blank except the headings—are entitled "Particulars of Endorsements." It is evident that the County Council has taken to heart the recent *obiter dictum* of a leading Metropolitan magistrate that he would not care a (something or other) if his licence were covered with endorsements. They have provided plenty of room for licences to be endorsed. That it is not exactly a compliment to the licence-holder goes without saying, but it will certainly be appreciated by the manufacturers of paper. Once upon a time a well-known paper factory produced a single sheet of paper (presumably for exhibition purposes) some two miles in length. No one quite knew what to do with this monumental achievement until a solicitor discovered that it was the very thing he wanted to make out a bill of costs upon. Next year, we shall probably see similar lengths of paper specially manufactured for attachment to drivers' licences.

♦ ♦ ♦ The Motor Car Volunteer Officers.

ONE of Mr. Anthony Hope's novels describes a country of romance in which all the inhabitants objected to being commoners, so the presiding potentate issued a ukase to the effect that henceforth everyone a citizen of, or born into, his kingdom should be *ipso facto* a nobleman, and everybody was happy. A somewhat similar suggestion has been put forward regarding the motor car volunteers. In this *corps d'élite*, if the proposal is agreed to, there will be no longer any such ordinary mortals as privates. The lowest rank will be that of lieutenant. At first sight the idea of a regiment in which everybody is an officer, and there is no one to command or order about, might excite the hilarity of the uninitiated, and, as a matter of fact, there has been a certain amount of sarcastic writing on the subject in the columns of the daily press. As a matter of fact, there is more reason in the suggestion than at first sight appears, and though the cynics may smile, it is after all quite a reasonable arrangement. Practically all the owners of motor cars will be doing the work of staff officers, and this should entitle them to this rank in the field, quite apart from the fact that they are mostly men of leisure and position, to retain whom on a military footing of equality with the privates of marching regiments would be absurd. As, however, the cynics are likely to make merry over the idea of a regiment entirely composed of officers, it is just possible that the War Office authorities might with advantage convert all the members of the Corps into Staff Officers, and attach them permanently to that branch of the service, the regiment as such ceasing to exist.

CROSS-CHANNEL MOTOR-BOAT RACE.

BOULOGNE-FOLKESTONE RACE.—Napier II. at full speed, Mr. Edge's boat made the best time, but has been judged second place upon a technical point.

THE second International Cross-Channel Motor-Boat Race took place on Saturday, the 15th inst., over a course of 51 knots, from Boulogne to Folkestone and back, and resulted in a British triumph—Napier II., piloted by Macdonald, actually covering the distance in 2h. 24m. 47s., which is equivalent to a mean speed of 24.4 m.p.h. The next fastest boat—La Rapière—took 2h. 25m. 50s. for the course, but has been officially declared the winner because Macdonald steered Napier II. past the wrong side of the winning post.

When informed of his mistake Macdonald at once put about in order to make a "technical finish," and Napier II. is thus officially credited with 2h. 27m. 4s. instead of the faster time.

That the French should desire to claim a victory on merely technical grounds is an unsportsmanlike action, which would hardly find credence in England, had we not, unfortunately, already had a somewhat parallel experience in connection with last year's B.I.C. As a matter of fact, Mercedes IV., which secured the cross-channel race for France last year, *has not crossed the line to this day*, but

she was the fastest boat, and no Englishman—least of all Mr. S. F. Edge—thought of despoiling her of the honours which were her due. It is all the more remarkable, therefore, that the French should not have taken this opportunity of reciprocating, because, even if technicalities are more to them than sport, courtesy is popularly supposed to be their national virtue. Doubly would they be justified in acknowledging Napier II. the winner, as, although not actually part of the rules, it was generally understood that a French torpedo boat would show the way from start to finish; so that when this pilot passed to the west of the Boulogne harbour and crossed what was the starting line, Macdonald naturally followed, being immediately greeted by the boom of the winning gun. This recognition of Macdonald's action—made in the presence of many race officials, including Count Recoupé himself—prevented Macdonald from at once becoming aware that he had been guilty of any technical error; for had he known, he could, even then, easily have entered the harbour before La Rapière.

The misapprehension, we since learn from Mr. S. F.

BOULOGNE-FOLKESTONE RACE.—Palaisoto leading La Rapière, the winner, at Folkestone, Palaisoto being the first to round the mark boat this side of the Channel.

BOULOGNE-FOLKESTONE RACE.—Another view of Palaisoto (No. 4) and La Rapiere (No. 1) in their close race.

Edge, was also due to Macdonald not having had an opportunity of studying the rules prior to the race, as by an error they had been sent, not to Mr. Edge as they should have been, but to the Automobile Club. With what we may almost term quixotic generosity, Mr. Edge has decided that he is quite content with having demonstrated the superiority of the British boat, and does not intend to fight the disqualification—a fight in which, under the circumstances, he should almost certainly be successful. Napier II. will accordingly only carry off the first prize in the 12-metre class, instead of the Cup to which she is morally entitled.

Far more difficult was the race from Boulogne to Folkestone and back than was that from Dover to Calais last year. In the first place, the course was more than twice as long, and also the sea was by no means as calm. It is not altogether surprising, therefore, that so few finished, and it is all the more creditable that one of them—and that the first—should have been an English boat. Napier II. is the famous Yarrow-Napier craft which we described and illustrated in our issue of March 11th, 1905. It has a steel hull, and a pair of 4-cylinder engines operating twin propellers. The Napier, owned by Lord Howard de Walden, also competed, but the

engines got swamped when within a few miles from home, and the boat had to be towed in.

Palaisoto I, which was the first boat to turn the mark at Folkestone, had to be towed in, owing to the seas disabling the engine, while Mercedes-Charley and Pas-Pressé, both of which also had the same trouble, eventually reached Calais. Le Dubonnet, which has engines of some 300-h.p., was another competitor to make an ignominious return in tow; but her hull, which had been damaged in collision in harbour the night before, was not in a fit state for racing, and it was foolish to have started in such an unseaworthy condition.

Among the cruisers there was only one boat, the Fiat, entered by an Englishman. It was piloted by Lieut. Vereker, and, after making good running over a somewhat circuitous course, finally arrived at Folkestone, where the race was voluntarily abandoned owing to the illness of the mécanicien.

The best performance of all the cruisers was made by Forces Pas, Dietrich II. coming next. Cazmoto and Gardner-Serpollet being the only other boats of this category to finish the course. Aya IV. gave up at Folkestone; Le Tetu lost her way and finally arrived at Grisez; Chamber d'Antibes had engine troubles; and Frédéric Sauvage abandoned a few miles from the start.

An escorting torpedo boat "speaking" the cruiser

A contrast to the racers. The serviceable boat, Cazmoto,
in the cruiser class, third in its category.

BOULOGNE-FOLKESTONE RACE.

seven out of nineteen starters finished—a much smaller percentage than were successful last year. There is no doubt whatever that the trial was much more severe; but it has at least served to demonstrate that this type of boat is incapable of shipping much water without being speedily disabled through engine troubles. Motor boats, however, must expect to ship water in reasonable quantities, and until they can do so without harm, their general utility will be much impaired.

Some of the boats apparently lost their bearings through faulty compasses, so that even certified pilots were literally "at sea," and this point alone is one which it is of first importance to set right, for motor boats should be capable of going out of sight of land without getting lost.

As a sporting event the race has much to commend it, and it is perhaps a pity that it receives so little official support on this side of the Channel, although in a great measure this, no doubt, is due to the action of the French club in retaining all matters entirely in its own hands, almost discouraging co-operation from foreign countries.

THE 1905 FIAT CARS.

A 24-h.p. Fiat Touring Car, fitted with side entrance body and hood, similar to that recently acquired by H.I.M. the German Emperor.

THE Fiat models of last year—which we described in our issue of Feb. 20th, 1904—differed, it will be remembered, very considerably from those of the preceding year. They were of very greatly improved design, and constituted in fact an almost new type—a type which has been wisely followed in this year's models. In certain details, however, the new chassis—for which the Fiat Motors Limited are the sole concessionaires in this country—are superior to those of last year, for they have been modified in accordance with the most approved practice and have been brought thoroughly up to date. Needless to say, they are of the same high-grade construction as hitherto, and are well calculated to retain the confidence of the motoring public on the score of their reliability and speed capabilities.

Two of the standard models are nominally the same power as those of last year, viz., 16-h.p. and 24-h.p., but the engines are now of larger size, and their actual output is nearer 25-h.p. and 40-h.p. respectively. The stroke of the cylinders has, for this purpose, been lengthened in the smaller model to 125 mm., and in the larger model to 150 mm., this being an increase of 15 mm. in the one case and 25 mm. in the other. The bore, however, remains the same as previously, being 110 m. and 125 m. respectively. The other standard car, which is a new model this year, has a 60-h.p. engine.

Previously the pistons had dome-shaped tops, but this shape has now been abandoned in favour of the flat ended type. Instead of screw fittings above the valves, the new engines have their inspection-covers held down

Fig. 1.—The 1905 Fiat Chassis, as seen from above; the new type of gear-box and the additional foot-brake on the second-motion-shaft are visible in this view.

Fig. 2.—View of the new 24-h.p. Fiat Engine from the inlet-valve side, showing the carburettor and throttle-valve.

by yokes, which facilitate their removal, and half compression cocks are now fitted into the cylinder heads. So far as the arrangement of the valves is concerned, the engines are identical with those of last year, while the igniters, and also the method of "timing," remain unaltered. The "timing" on the Fiat engines is automatic, being entirely controlled by a mechanical governor, which operates a rod fitted inside the hollow inlet-valve cam-shaft. This rod alters the position of the igniter cams relatively to the cam-shaft, and, since the gear-wheel driving the magneto is also mounted on this rod, the magneto is, therefore, kept in synchronism with the tappets.

A slight modification has been made in the throttle-valve, which is now horizontal, but the valve itself is still inter-connected with an auxiliary air-valve, and the engine is also under the control of a centrifugal governor which is connected with it by a rod that passes through the hollow exhaust-valve cam-shaft. The large centrifugal circulating pump is mounted on the side of the crank-chamber, and the water-pipes still retain the same directness and absence of sharp bends. The belt-driven lubricator on the dashboard, which feeds oil in measured doses down each oil pipe, is also retained in a somewhat modified form.

The most important change is in the clutch, which is now of the multiple-disc type—that formerly fitted being of the internal expanding variety. The component parts of the clutch are very clearly shown

in Fig. 4, and the clutch complete is also visible, in place on the chassis, in Fig. 5. It is exceedingly compact, and is enclosed in a cylindrical case, A, which is bolted to the boss of the large fly-wheel, an aluminium cover, A', being provided to retain oil and exclude dust. The driving discs fit freely on longitudinal keys which project from the inner face of the member, A, and the driven discs also fit freely on longitudinal key-ways which are cut in the outer surface of a member, B²—secured by the flange, B', to the driven shaft, B.

When in place, the driving discs and the driven discs are arranged alternately, and overlap one another, but they are normally prevented from "seizing" when the clutch is disengaged by the action of small leaf springs, A⁴, which separate them. These leaf springs are formed by notching the outer edge of the driving discs at four places on the circumference, and then bending back the small pieces which have been partially cut away. The positions of some of these springy separating pieces are clearly indicated in Fig. 4. The clutch is engaged by allowing the clutch-spring, C², to compress all the discs firmly together. The force of the clutch-spring operates through a cup-shaped member, C', which has a suitable diameter for operating upon the discs, and the clutch is disengaged in the usual way by a foot pedal, which is connected with the clutch-fork, C. A simple adjustment for the clutch-spring is provided by means of the nuts, C³.

Fig. 3.—The 1905 model 24-h.p. Fiat Engine, as seen from the exhaust-valve side, showing the circulating pump, the gear-wheels, and one of the governors.

A2

Fig. 4.—The Fiat Disc-Clutch, complete and in parts. In the lower illustration, two of the discs (driven, B³, and driving, A²) are shown separately, and the separating springs, A⁴—, which are notched out of the periphery of the latter—are clearly visible.

The other parts of the chassis have not undergone radical change, but the gear-box no longer has a three-point suspension. The shape of the gear-box is, moreover, somewhat modified, and the differential case, which is still in one piece with the main casting, is self contained. The change-speed-gear is similar to that of last year, and is modelled on the Mercedes pattern. Another resemblance to the Mercedes vehicle is to be found this year—the presence of a foot-brake on the second-motion-shaft, in addition to that on the countershaft. These two brakes are interconnected through a compensating device with the same foot-pedal, and both have water-cooled drums.

The countershaft brake is of the simple band variety, and is actuated by a toggle mechanism; the second-

Argumentum ad ampulam fractam.—The argument of the broken bottle was brought up with much effect by Sir C. Rasch in the House of Commons recently in regard to a question which he had asked of the President of the Local Government Board, as to when the Royal Commission on the working of the Motor Car Act would commence its “labours.” Mr. G. Balfour informed Sir C. Rasch that “steps were now being taken to appoint the Commission.” Sir C. Rasch further insisted that the matter was one which did not admit of delay, and asked Mr. Balfour if he were aware that broken bottles and other arguments of that sort were being used in East Anglia. It is a timely reminder on the part of Sir C. Rasch. The general view of many people is that the considerations put before the Commission will be all on one side. These people, we venture to think, are destined to some surprise. The motorists’ case is an extremely strong one, and Sir C. Rasch’s remark provides a mild foretaste of what it will be.

Fig. 5.—View of the 1905 model Fiat Chassis, showing the dash, the clutch, and the controlling levers and pedals.

motion-shaft brake is similar in principle, but is operated by an ingenious arrangement of cams. The hub-brakes are—as before—of the internal expanding type, and are supported, as formerly, on the large flat radius-rods which the Fiat Company were among the first to introduce into their vehicles, and have now become so very popular with many well-known makers. Notwithstanding the popularity of the Fiat cars in the past, the alterations which we have enumerated as having been embodied in this year’s models cannot but ensure an increased circle of users in the future, while the magnificent running of the competing cars in the Gordon-Bennett Race must in itself very greatly strengthen the confidence with which these vehicles have always been regarded in the automobile world.

THE service between Hythe and Lydd (Romsey Marsh), is proving an enormous convenience to those in the district. This may be realised from the fact that at present the journey by rail occupies between three and four hours, whilst the motor cars running direct complete the journey in a little over one hour.

It appears that the Hove authorities only permitted the Worthing Motor Omnibus Company to ply for hire between Worthing and Hove on the preposterous condition that 6*d.* should be the smallest fare charged. The Company is more reasonable in its view of fares, and the Watch Committee is now becoming more open-minded and is agreeing to allow this sum to be reduced to 3*d.* The Company is now proposing to extend its service to Pulborough, and licences for seven cars for this service were asked for. The Hove Watch Committee appears to be in favour of granting the licences.

THE 1905 DE DIETRICH CARS.—PART IV.

The Carburettor and Its Connections.

REFERRING TO Figs. 15 and 16, it will be gathered that the float-controlled needle-valve, which regulates the admission of petrol to the float-feed-chamber, A^1 , is arranged at the side, instead of in the centre, of that chamber. Above it, is the "agitator," A^2 , for flooding the carburettor if necessary, and, beneath it, is the removable plug, A^3 , that not only constitutes a seating for it, but also contains a filter. A very simple lever device connects the float with the needle-valve; the advantages of being able to remove the seating for cleaning purposes are considerable.

The spray-jet, A^4 , which projects up inside the mixing-chamber, J , is also arranged in a similarly convenient manner for easy removal. It is screwed up into position

normally kept nearly closed by a spring. An adjustable stop, J^4 , however, prevents the throttle-valve from closing completely, this being set so that the engine can continue to run slowly when doing no work. Connected to the outer end of the lever is a vertical rod, to which are fixed the three projecting pins, J^6 , each of these pins being engaged by one of the pivoted levers, J^7 (see Fig. 13). One of the levers, J^7 , is controlled by the hand-lever, K , above the steering-wheel, a second by the accelerator-pedal, K^2 , and the third by the clutch-pedal, L . The hand-lever, K , is connected direct by the lever, E^4 , which is visible in Fig. 13, but the arrangement of the clutch and accelerator-pedals can be best gathered by referring to Fig. 17. The accelerator-pedal, K^2 —like the hand-lever, K —tends to open the throttle-

Fig. 15.—Two views of the De Dietrich Carburettor, with one of the induction-pipes (C^1) in place.

Fig. 16.—Sectional drawing showing the construction of the De Dietrich Carburettor.

from beneath, and there is a plug, A^3 , immediately beneath it.

Surrounding the upper portion of the jet, is a stationary sleeve which forms the outer member of the throttle-valve, this sleeve having large ports cut through its wall for the explosive mixture to find its way to the two induction-pipes, C^1 . The inner sliding-sleeve, J^3 , not only controls the area of these ports, but it also has ports at its upper ends, through which an auxiliary air supply can enter by way of the holes, J^2 . This arrangement produces two effects, for, in the first place, an approximately constant richness of mixture is maintained—owing to the relative shapes of the throttle and auxiliary-air ports—and, in the second place, an increased spraying effect results from the direct collision of the auxiliary air with the already formed explosive mixture.

The sliding valve-sleeve, J^3 , is controlled by the pivoted lever, J^5 , above the carburettor, the valves being

valve against the action of its spring, but the clutch-pedal, when depressed, has an opposite effect on the valve, if the valve happens at the time to be open. The accelerator mechanism is so designed that its action is superior to that of both the other controlling devices, and that the valve can therefore always be opened by it. In Fig. 17, it will be seen that this pedal, K^2 , is held in its normal position by the spring, K^3 , and that it is connected with its lever, J^7 , by the rod, K^4 ; unlike the clutch-pedal, it is mounted in the usual way.

The peculiar feature about the clutch-pedal is that it is made in two parts, L and L^2 , the former, which carries the footplate, being pivoted to the latter part. Acting against a comparatively weak spring, the portion, L , rocks about its fulcrum before it begins to move the portion, L^2 , and during this time it causes the small shaft, K^5 , to rock about its axis, because the shaft, K^5 , carries the small roller, K^6 , on a lever-arm, and this roller presses up against the lower end of the portion, L .

Fig. 17.—The De Dietrich main clutch. Three views demonstrating the facility with which the leather-faced cone can be removed from place in the chassis when necessary, and another view of the clutch-cone (and its shaft) removed from the chassis, and shown separately.

The shaft, K^5 , is connected by the rod, K^6 , with one of the levers, J^7 , to which we have already referred, and, although the spring, K^7 , normally prevents the rod, K^6 , from closing the throttle-valve, yet the valve is in this way caused to close when the clutch-pedal, L , is depressed.

In Fig. 14, is seen the auxiliary fuel-tank, A^1 , that enables the carburettor to be fed by gravity when there is no pressure in the main tank. Normally, the petrol is forced up into this tank, A^1 , on its way to the engine, and passes through the cock, A^2 . But the pipe-connection leading into the tank, A^1 , projects up a considerable distance within it, and therefore the tendency is for the auxiliary tank to be kept full. The cock, A^3 , allows air to be admitted when the tank is in use; and enables the air to be let out after use.

The Main Clutch.

The inner member of the main clutch—the leather-faced cone, L^3 —is carried by two driving pins, L^7 , that project from the clutch-shaft, L^6 . These pins allow the clutch-cone to slide longitudinally, although the shaft, L^6 —which is hollow—does not slide with it. By this means two ball bearings can be introduced between the hollow shaft, L^6 , and the projecting end of the crank-shaft, F^3 , on which it rides. The clutch-shaft, L^6 , is

connected with the change-speed-gear by a propeller-shaft, L^9 , that has universal joints at both ends, and it is thus only necessary to remove one of the pins from the forward joint to completely disconnect the clutch-cone. In order to enable it to be actually removed, the forging, L^4 —which engages its thrust collar—has forks formed at its ends, enabling this forging to be hinged up out of the way, as shown in the lower view in Fig. 17. The forging, L^4 , is pivoted to the two lever-arms, I^3 , which in turn are secured to the clutch-pedal, and are normally pressed forward by the stationary clutch-spring, L^1 . The forging, L^4 , is prevented from jumping out of place, when in use, by a stirrup, which is visible in our illustrations. In Fig. 17 the clutch-cone, L^3 , fitted with the forging, L^4 , is shown separately, while to the right of it, is the hollow shaft, L^6 , and a portion, L^8 , of the universal joint.

(To be concluded.)

THE Deaf and Dumb Association, who have been holding a meeting at Bowness, are evidently not without a certain vein of humour, as they put placards up in the district to the following effect :—

“Motor Cars and Cyclists Beware !
A Deaf and Dumb Congress is being held this week.”

DUST TRIALS NEAR LUTON.

BECAUSE the real solution to the dust problem is to be looked for in the construction of proper roads, it does not follow that motorists should remain inactive while patiently waiting for that most desirable millennium. There is no doubt that there are dusty cars—and dusty cars, and such being the case it is obviously desirable that the causes of these differences should be investigated as far as possible. To this end some trials were recently carried out by the British Automobile Commercial Syndicate, who claim that they have, in a make of car for which they act in England as agents—to wit the Spyker—a vehicle which is an immense advance towards the much to be desired “dustless” article. The results

well shown by our series of photographs, which demonstrate very clearly that Mr. Wilson's car raised very much less dust than did the other vehicles. In addition to these tests we were able, through the courtesy of Mr. Wilson, to observe the behaviour of the car during the run to and from the selected road, and although where the surface was really dusty it certainly raised dust, such dust-clouds were always translucent, and never exceeded a few feet in height from the ground.

An explanation of this comparative immunity can, in this instance, only be looked for in the general lines of the car, and here the reasons are not far to seek. The Spyker car is of the live-axle type, and has a smooth metal

DUST TRIALS NEAR LUTON.—Views from the front and from behind of Mr. Wilson's “dustless” Spyker Car going over the course. Distant objects are, it will be noticed, clearly visible through the dust, whereas in the other photographs they are quite obliterated.

of these tests will doubtless be welcomed by motorists generally, especially as they have waited so long for the results of the more comprehensive experiments which have been (and, we assume, still are being) conducted by the A.C.G.B.I.

No special device of any description was fitted to the 15-h.p. Spyker test car, which was, in fact, placed at the disposal of the B.A.C.S. by a private owner, Mr. Wilson, who had first drawn their attention to its dustless properties. The tests were carried out over a very dusty stretch of road near Luton, and consisted in comparing the dust clouds raised by various cars of different makes as they passed over the course. The results are

sheath placed under the engine and gear-box. The sheath itself is a reasonable height from the ground, but behind the shield there is practically no other obstruction; even the exhaust-box is arranged longitudinally, and in such a manner that the exhaust gases cannot contribute towards raising the dust. With such an open under-build, no eddies are formed, and the dust is not caught up and swirled aloft as it generally is with cars which have bulky projections, such as tool boxes and silencers, depending from the rear part of the chassis.

The effect of the tyres on dust is also an important consideration, but although the tyres lift a large quantity of dust from the surface of the ground, they do not of

DUST TRIALS NEAR LUTON.—Various cars of different makes being driven over the course. The dust-clouds raised by these cars should be compared with that raised by the "dustless" car shown in our other illustration.

themselves tend to disperse it into the atmosphere. During this trial, the Spyker car used metal-studded non-skid bands, and it was noticeable that the dust actually raised by them was less than that raised by the smooth rubber tyres used on some of the other vehicles.

Comparative dustlessness is naturally the result of the influence of several factors, but it would be a distinctly progressive step if all cars were made no more objectionable in this respect than is the particular car in question.

THE humours of police court proceedings were forcibly emphasised recently at Great Marlborough Street Police Court, when Enigmarelle, the mechanical triumph of the Hippodrome, was summoned for creating an obstruction by proceeding through the streets of London in a motor car, owing to the fact that a large number of people, attracted by the spectacle, ran after him. Had the car containing Enigmarelle remained stationary, we could understand the obstruction; but how even Mr. Kennedy could have brought himself to inflicting a fine on Enigmarelle's supporters of 40s. and costs under the circumstances, passes comprehension. Even while outside the police court to which he had been summoned, Enigmarelle was ordered by the police to "move on," and, no doubt, had he failed immediately to do so, he would have been again summoned for further obstruction caused by attending in response to the first summons. It is obvious that the police can have you every time when they mean to. In order to escape from the crowd and subsequent fines, Enigmarelle had to run his car into Messrs. Jarrott and Letts's garage, and his numerous admirers had to content themselves with squeezing their noses against the substantial plate-glass windows. Next week we shall, no doubt, hear that Messrs. Jarrott and Letts have been summoned for creating an obstruction owing to the fact

that "certain evil-disposed persons did congregate in front of their premises, and with malice prepense persistently stare through their plate-glass windows, to the annoyance and discomfort of His Majesty's lieges."

WE have referred on more than one occasion to the successful introduction of the automobile, not only into the ancient presence of the Sphinx itself, but also to its adaptation to traversing even the desert sands by which that strangest of countries, Egypt, is surrounded. The introduction of the automobile is only an evidence—the crowning evidence, perhaps—of the splendid industrial progress of modern Egypt. How universal and wide-reaching this has been since the British occupation is admirably shown by the *Financial News* Egyptian Supplement, which has been issued for the express purpose of proving what has been effected during the last decade or so, and is an admirable testimonial to the enterprise of our financial contemporary. The supplement is well illustrated throughout, and most firms who note the view of the old stern-wheeler steamboat will probably speculate on the fine field that the Nile would afford for motor-boating, and probably form a resolution that the invasion of the Land of the Pharaohs by automobilism shall not be confined to the *terra-firma* only.

AERONAUTICS.

ACCORDING to the old German and Swiss legend, the *Bergeister* were in the habit of invariably attempting to overwhelm the adventurous mountaineer who had the hardihood to attempt to climb previously unscaled peaks, by sending upon him at a critical moment thunderstorms, whirlwinds, and various kinds of avalanches. Once a peak had been scaled the *Bergeister* usually retired in dudgeon, and subsequent adventurers could essay the same road with comparative safety. It must be admitted that similar strange phenomena have been observed at every step in man's progress towards the conquest of natural forces. The attempts made upon the empire of the air provide plenty of instances of the kind, and two of the most painful of them have been illustrated by the history of the Lebaudy airship. It was just as Lebaudy No. 1 had completed her tour from Moisson to Paris, and from Paris to Challais Meudon, and was actually alighting on the ground, that she was caught by a squall, hurled against a tree, and broken up. Similar destruction overwhelmed the splendid airship at the end of her recent tour. She had made a record journey largely against the wind from Moisson to the camp of Chalons, encountering almost a storm during the latter stages of the tour, which, however, she successfully surmounted, and arrived in triumph in Chalons Camp, where she had hardly been moored when the storm developed into a hurricane that even threw down telegraph poles. Moored in the open, no conceivable airship could stand a tempest of this kind, and it is certainly most singular that tempests of such ferocity are decidedly rare in the middle of France. The cables were pulled out of the hands of the thirty soldiers who held them and the airship was driven against some trees, causing the gas vessel to burst. Fortunately, the occupants of the car were within a few feet of the ground, and escaped practically uninjured. It is too soon to be certain whether the airship can or cannot be repaired, but in any case the designers and owners of the great machine—by far the most successful aeronautical contrivance, as our readers are aware, of modern times—may console themselves by the reflection that, like Gustavus Adolphus, Lebaudy II. had won her battle when she met her end.

The irritating part about the situation is that it is quite possible the airship might have escaped injury had the hurricane come up while she was *en route*, as she might then have been able to run before it, and beat back when the violence of the storm was exhausted.

MESSRS. LEBAUDY and their collaborators have shown themselves such enthusiasts in the cause of aerial navigation that we feel confident that they will not be deterred by this very untoward and incalculable misfortune at the very moment of victory from prosecuting their experiments and researches further. We feel sure that before long a Lebaudy No. 3 will rise from the

⊗ ⊗

THE Bench at Odiham may lay claim to the proud distinction of, on Tuesday last, having had twenty-two motorists, including a "belted earl," several knights and baronets, justices of the peace, and Sir Thomas Lipton arraigned before them, and fining the twenty-two sums which altogether amounted to £186 19s. One of the unfortunates was a foreign driver in the employment of Mrs. Ogden Mills, who had only been three days in the country, and he was fined £21 18s., including costs, for

ashes or remains of Lebaudy No. 2. But the important question is whether it is really fair that private individuals, however wealthy and enthusiastic, should be allowed to bear the whole brunt of the enormous expense involved in such experiments. The Lebaudy airship has fully demonstrated what it can do. A Government representative, the head of its Aeronautical Department, or his chief assistant were on board all the time, and must report that no airship before has ever accomplished so much. It is certainly time that the French Government and the national exchequer should come to the assistance of the plucky and enthusiastic experimenters. Indeed, the conquest of the air is not a merely national affair, and it would only be reasonable for the whole civilised world to assist in providing further sinews of war for what has already proved the most victorious campaign ever waged against the powers of the atmosphere.

It must not be forgotten that the chief contributing cause of the destruction was the absence of shelter at the Chalons Camp. An airship, however successful, which cannot rely upon an adequate shelter in which to take refuge at the end of its voyage, is like a vessel cruising round a perpetually rocky coast, destitute of a single harbour, and attempting to moor itself with cables to the sides of the cliffs. A vessel in such a position is obviously at the mercy of the first storm that gets up. The position of the Lebaudy on its tour was precisely similar. The only security it could obtain was that provided by its guide-ropes, and these are hopelessly inadequate in the case of a real storm. Even if the guide-ropes hold, the air pressure is bound to endanger the envelope which, unlike that of an ordinary spherical balloon, is already under a very considerable pressure. For navigable airships to be able to undertake extended tours of this kind without frequently running the risk of destruction, the erection of adequate sheds or shelters of some kind for housing them at the various points they propose to land, is a *sine qua non*, and this, it is plain, is an undertaking of national, if not international, magnitude.

THE Barton airship, which has for so long been lying inactive at the Alexandra Palace, took the air again on Friday last, and made a short excursion on the guide rope. Dr. Barton and Mr. F. L. Lawson were both on board of her, and it is estimated that when the propellers were working properly she developed a forward speed of from 15 to 20 miles an hour. The vessel also appeared to obey the rudder most satisfactorily. There was a moment during the experiments when there seemed to be some danger of the big airship crashing into a tree, but the huge rudder was put well over, and had the effect of deflecting the airship away from this threatened danger. A "free" ascent may possibly be attempted to-day (Saturday).

⊗ ⊗

reckless driving, and another £10 for refusing to stop when called upon. When he returns to his native country he will doubtless have a French, German, or Belgian equivalent for the song "What a Happy Land is England!" and perhaps he will sing it to the tune of "Rule Britannia." Under the circumstances we think Odiham might appropriately change its name to Odi-automobile, for certainly the hatred of the automobile reigns supreme upon that particular Bench.

CORRESPONDENCE.

* * The name and address of the writer (not necessarily for publication) MUST in all cases accompany letters intended for insertion, or containing queries.

TOURIST CARS AND RACING.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—I have read with very great pleasure the excellent leading articles which have appeared in the current issue of your Journal concerning the racing of touring cars. The attitude taken by you very strongly accords with the views that I have held on this subject for some time, and it may therefore not be without interest to you and your readers if I give you some extracts from a letter which I wrote to the Committee of the Automobile Club on April 17th last, immediately after my retirement from that Committee. Amongst the questions put forward in that letter were the following:—

2. Is it at all probable that systematic disregard of the 20 miles per hour limit may lead to the imposition of restrictions.

Note.—The French Government some time ago prevented the use of high-speed cars in France by a special device.

3. Is there any fear that there may be imposed further restrictions of the nature above indicated or of a character calculated to damage automobile interests in the United Kingdom?

4. Does the Automobile Club wish to be regarded by the legislature and the public as a body which discourages the breaking of the law as passed by Parliament, or does the Club when the reconsideration of the Motor Act is before Parliament wish to be regarded as a body which has "winked" at the systematic disregard of the law?

5. Will the Club admit to races for touring cars held under its rules, four-seated cars capable of speeds of 60 miles an hour and upwards?

Note.—In the race for touring cars held at Bexhill under the club rules last autumn, 60-h.p. Mercedes were raced as touring cars, and in the forthcoming reliability trials of the Scottish Automobile Club the definition of a touring car will admit cars which can be driven on the flat at quite 60 miles an hour.

6. What excuse is there for doing so? Can it be seriously supposed that a man who spends £1,000 in buying a 60-h.p. car, with light touring body for four persons, has no intention of breaking the law?

7. Is it politic for a club which professes to uphold the law of the land to include or permit others to include in races for touring cars, high-powered automobiles, capable of travelling at 60 miles an hour and upwards?

8. Is it wise that speed results of touring cars should be published showing that they are capable of speeds three times as fast as that allowed by the law?

9. Would not the suppression of the publication of the speeds made point to the fact that the club is admitting as touring cars cars which are capable of such speeds that it is inadvisable to publish them?

10. Would not the club, by admitting such cars to be tourist cars, be forging weapons which may be used with great effect against automobile interests when the law as to motor cars is reconsidered by Parliament?

11. Are not short distance speed meetings now unnecessary in connection with the encouragement of the use of motor cars? Do they perform any useful service to the automobile movement? Do they not tend to emphasise the importance of speed and thus interfere with the efforts of the club to emphasise the importance of reliability?

Is it not the duty of the club to avoid and prohibit any action which may tend to damage the movement as a whole?

12. If speed meetings must be held would it not be wise only to admit as Tourist Car cars in which the horse-power is in such relation to the weight as may enable the club, with a good conscience, to state that they may be purchased and used by a man who *bona fide* does not intend to exceed (or does not in any case intend to seriously exceed) the legal limit of speed, and to relegate all other cars to the racing classes.

13. For instance, might it not be laid down as a rule governing all competitions in the Kingdom that no car shall be admitted into a race for touring cars which shall have cylinder capacity exceeding the capacity of an engine having four cylinders of 4 in. by 4 in. Might not all other cars be put into the racing section, which could again be sub-divided according to the cylinder capacity, and the cars could be run in racing trim, so that there would be no impression left on the minds of the public that they are intended to be used as touring cars.

14. Generally speaking, should not the attitude of the club towards high-speed touring cars be "We cannot prevent manufac-

turers making them nor purchasers buying them, but we will not allow them to be run as touring cars in any competition in this Kingdom"?

In conclusion, Mr. Editor, I think that the whole danger of the position is that the members of the Committee of the Automobile Club, who rejected the proposal of the Public Policy Committee of the Club that the Club should not countenance the racing of touring cars (except, of course, in the Race for the Tourist Cup, in which the speed is designedly within reasonable limits), do not realise what may take place in Parliament. They appear to feel secure because there are a certain number of Members of Parliament who drive motor cars. They do not, I fear, realise that the feeling against motor cars is, at the present time, stronger than it ever has been in the history of the movement, and that Members of Parliament, whether they are motor owners or not, are, generally speaking, servants of their constituents, and that, with a General Election looming near at hand, very few, if any, Members of Parliament can afford to disregard the feelings of their constituents, especially when they are agitated on such a vexed question as the motor nuisance.

Yours faithfully,

CLAUDE JOHNSON.

MOTORISTS AND THE LAW.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—Under the heading "Jumping on a Wife," it was stated in a recent issue of the *Standard* that a man who objected to his consort attending a tea party, at the invitation of the Vicar, violently assaulted her on her return. The woman said that her husband struck her a number of blows, threw her on the ground, kicked her, and jumped on her. Their little daughter ran for the police, and the woman rushed into the street, where she was found in an unconscious condition. The police Magistrate who tried the case said he would take into consideration the good character the prisoner had received from his employers, so he fined him 20s., giving him seven days in which to pay the fine.

A short time since, a motorist was haled before a Bench of Magistrates in Sussex for slightly exceeding the speed limit over a measured furlong. The police (who were very fair) admitted that the road was straight, and that neither man, woman, child, nor animal was in sight. It was the motorist's first offence. He was fined £10 and costs.

Moral.—If you *must* break the law, trample on your wife. It is ten times cheaper than to exceed (however slightly) the speed limit on a deserted road, and there is the additional advantage that you may be given time in which to pay.

I am, Sir, your obedient servant,

Roehampton, July 14.

W. J. BOSWORTH (Colonel).

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—On Wednesday, the 12th instant, I attended the Mortlake Police Court to answer a summons for driving my car at an alleged speed of twenty-six miles an hour between Hammersmith Bridge and Barnes Common—a speed which I absolutely denied in Court, as at the time I was stopped I had just slowed down to go through the dust of a passing car. Danger to the public was not part of the charge, the road being practically deserted at the time. In spite of this, however, I was fined £6 and 13s. 6d. costs. Just before my case a carter was convicted of wantonly illtreating a horse, and was proved to have thrashed the poor beast unmercifully. He was found guilty, and was fined 20s.

I consider this a gross injustice, and one that is liable to bring the magistrates of England into contempt, for here am I doing no harm to anyone fined £6 and 13s. 6d. costs, and a blackguardly carter, who illtreats a poor dumb animal until he almost kills it, is let off with a paltry 20s.

Such cases as these are of daily occurrence, and prove clearly that such societies as the recently-formed Automobile Association are badly needed, and that no time should be lost in forming a strong combination to assist motorists in obtaining the justice they deserve and so seldom obtain.

Yours faithfully,

COLIN DEFRIES.

Northrepps House, Overstrand, Cromer,
July 15th.

P.S.—I draw the attention of the public to these facts in some o

the daily papers this week, and amongst the many letters I have received is the following:—

"SIR,—I notice your letter in to-day's paper. I much regret you are fined £6 and 13s. 6d. costs, instead of being sent to gaol with a month's hard labour. I assure you that I shall do my utmost to get all road hogs convicted without the option of a fine.

"Yours faithfully,

"A LOVER OF JUSTICE."

This prejudiced idiot has not even got sufficient courage of his convictions to send his address, but it shows the class of people we have to deal with at present, and clearly demonstrates that we must fight them as hard as we can.

INDUCTION COILS.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—We have been struck with the large number of induction coils of all sorts of makes which have been sent to us during this season for repair, and which have the curious symptom that the insulation is to a great extent destroyed, and the paraffin wax with which the coil has been packed is melted, and in many cases has bubbled out in various places on the coil, and made it into a messy and unworkable condition.

These symptoms are quite peculiar to this season, and have never occurred before, at least not in anything like the same number of cases. We have therefore been carefully tracing the cause, and we find whereas it used to be the custom to fit motor vehicles with connecting plugs, and it was usual when it was desired to permanently stop the motor, to remove the connecting plug, but now the custom is in many cases, especially in the provinces, to stop the motor by cutting off the gas, and not to trouble to switch off the current.

The result of this is, if the contact-breaker happens to be in touch when the motor is stopped, as of course very often does occur, the current is left to continuously pour through the coil without any breaks, the same as occur when the motor is running, and then, as time goes on, such a strain on the coil is caused that no induction coil used for ignition purposes could be reasonably expected to stand it, and the coil gets so heated that those bubbling-up symptoms above described occur, and the coil is temporarily rendered useless.

It is, of course, hardly to our interest to reduce the number of repairs, and thus curtail the turnover in our repair department, but we feel that it is not to the general interest of the automobile trade that private users of cars should be put to the inconvenience and expense of having to wait for their coils over some period whilst they are being repaired, when that trouble could be so easily avoided by the very simple precaution of switching off the current after the motor is stopped, and previous to putting the car away for the day.

We trust, therefore, you will see your way to give publicity to this rather important point, because we find numbers of people who are having trouble with their coils through this sole cause, which is very greatly on the increase.

Thanking you in anticipation,

Yours faithfully,

For the United Motor Industries, Limited,
G. H. SMITH.

GORDON-BENNETT RACE AND TYRES.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—We have had an opportunity, on the return of our Mr. Paul Brodtmann from Hanover, to learn some very interesting facts in connection with the recent Gordon-Bennett Race. Mr. Brodtmann discussed this matter in detail with Mr. Tischbein, specially in reference to the assertion that the German cars did not show up so well this year, and the reason was given that this must be attributed, in the first place, to such cars having been fitted with tyres which proved too light for a course of this nature. As you are already aware, there exists on this course no less than 700 sharp curves, each necessitating a strong application of the brake. The surface of the road is exceedingly hard, and composed, so far as could be judged, of a granite-like stone. Consequent upon the continual traffic over the course, the surface of the streets was, so to speak, "torn up," which is naturally a disadvantage to pneumatic tyres, and it was a mistake that our drivers could not previously cover the course four times at top speed. The reason of this mistake was apparent, as we should then have had an opportunity of ascertaining the nature of the road surface and the effect on our tyres, which advantage the French had in their eliminating trials. Our drivers informed us that our touring tyres, which we also supply for use in racing events, would hold out for about three rounds, and consequently we only decided to change the tyres after the completion of the second round. In the actual race itself this proved insufficient.

The Mercedes cars were very fast, and kept close up, but the tyres were too light for such conditions. It was not due to any indiscretion in the choice of tyres, as the fact that everyone was deceived as to the strength of the tyres to be used in such an event is amply proved by the results of the French Eliminating Trials. Practically every driver had from eight to ten punctures, and many finished on the rims. Each driver had stops of considerable length consequent upon the changing of the tyres.

The result was that the French and Italian cars were fitted with very heavy tyres for the actual race, which, nevertheless, did not prevent the continual changing. It cannot, therefore, with truth be asserted that Continental tyres showed any actual defects, and it is also incorrect to say that Jenatz during the first round had eleven punctures. As already said, owing to the high speed at which the cars travelled, and owing to the condition of the roads, the Continental tyres were, after one round, worn down to the canvas, the wearing being to a great extent influenced by the continual application of the brakes, which was necessary over a course of this description. The following will prove what an effect the ride had upon the tyres:—

At our dépôt near Moreno, we erected a low wooden platform to render the fitting of the tyres somewhat easier, and immediately after the tyres on the first cars had been changed, Mr. Tischbein noticed a strong smell of burnt rubber, which led him to at first believe that the rubber tyres had come into contact with some benzine, and had caught fire from one of the cigars of the many spectators present. Only after the departure of the car was the exact impression of the tyre in the wood noticed, so exact, that on closer examination the small grooves in the rubber and the wooden surface at that moment must have been so strong as to have generated a heat of far more than 100 degs. Celsius.

Mr. Brodtmann put the question as to whether such circumstances could not have been avoided, and Mr. Tischbein replied that this could certainly have been done had we known what we have now gained by experience. It was impossible for either us or the Mercedes people to foresee such an event.

Jenatz and Baron de Caters were, practically speaking, the only two who covered the course correctly. Both were exceedingly pleased with the Mercedes cars and the behaviour of the Continental tyres.

The cars were very fast and ran very evenly, and both these drivers were under the impression that the Continental tyres would easily last out three rounds. If we had had the experience of an eliminating trial to work upon, the same as the French had, we should certainly have made other provisions. We should above all other things have fitted the cars with heavier tyres.

We would only like to add that no Continental tyres burst, and that the statements in regard to tyre defects which have recently appeared in the Press, do not at all coincide with facts.

With the exception of Baron de Caters, who had two nail punctures, not a single Mercedes car had reason to complain of tyre defects, only the continual changing of the tyres cost the Mercedes cars valuable time.

It has been further stated that the fitting of the tyres on the French and Italian cars was completed in much shorter time than by us, but the actual time for fitting a complete set of 4 tyres occupied about 7 minutes, an undertaking which any well-informed man will agree is highly satisfactory.—Yours faithfully,

THE CONTINENTAL TYRE AND RUBBER COMPANY (GREAT BRITAIN), LIMITED.

July 14th.

G. JUNG, Secretary.

Not content with the wholesale tramification of London, the organisation of a service of Thames steamers (more or less effective), and arranging plans for the construction of a "lordly pleasure house" for their own delectation, the London County Council now propose to enter the arena of journalism, and have, we learn, in contemplation the publication of what purports to be a "London County Council Gazette." The ludicrous statement is put forward by the supporters of this scheme that the cost will only amount to £24 per week. We remember another official publication which the official statement of figures and accounts has declared to cost nothing at all, though others have a strong opinion that it costs the motor car industry between £5,000 and £6,000 annually. We know these costless journalistic undertakings!

THE TOURIST TROPHY, AND ITS VALUE TO CAR OWNERS.—PART II.

NATURALLY the makers will have to cut everything rather fine in order to obtain the best results under the definite conditions specifically stated in the rules, but it is quite possible that any allowance that may be made for inferior roads, muddy surface or hilly routes, will favour other cars that comply less exactly with that specification. Luck, however, is bound to enter very largely into any such competitions, and, after all, the cars will only have to face what any touring car has at times to contend with, while, obviously, even those competitors who do not actually win, but make a fine performance, will benefit from the confidence they inspire in the public. As at present decided by the A.C.G.B.I., the fuel allowance is to be taken on the basis of one gallon for each 25 miles of average dry roads, and the prevailing idea on which this has been fixed is that it will prevent an average speed of more than 25 miles an hour from being maintained.

How to Restrict Weight.

Since this is a question which affects "speed" as well as "touring car requirements," it is a crucial one, and it has to be considered from both these points of view. It arises because there are two or three different ways in which a weight limit could be imposed:—by specifying (1) the weight of the complete car, (2) the weight of body with its useful load, and (3) the weight of the chassis as well as of the "load," concerning which methods there are many sound reasons for discarding the first, adopting the second, and regarding the last as a somewhat moot point, as we now proceed to show.

Although the specification of a total weight, combined with the fuel allowance, would serve to restrict "speed," the tendency would certainly not be beneficial as regards "touring car conditions," since every endeavour would be made to utilise the whole permitted weight as a part of the chassis and various totally uncommercial auxiliary devices would probably be employed with the object of attaining higher average speeds. Even though anything that was obviously a freak might be barred at the discretion of the organizers, it would be extremely difficult to draw any hard and fast line without erring on one side or the other. But, perhaps, the even more important arguments that can be urged against this possible method are more of a negative nature, and will, therefore, emerge with greater clearness from a consideration of the alternative proposals.

By fixing a definite weight for the body with its passengers (or equivalent load), it is obvious that a very important "touring-car requirement" would be ensured, while at the same time the adoption of this restriction would have the desired effect upon "speed." The weight of the "load" would demand a proper degree of strength in the chassis, and could be made, by suitable stipulations, to impose upon it the same strains—preferably intensified—as those encountered in ordinary working. There is, moreover, no direct incentive to the production of freaks, provided that reasonable provisions are made against them in the rules.

The real point at issue, however, is as to whether it is necessary or advisable to also impose any restrictions—maximum or minimum—on the weight of the chassis, and it is here that opinions evidently differ considerably. At first sight, everyone is naturally opposed to this on

general lines, and would like to see all its supposed merits obtained in some way that would at the same time allow the manufacturers greater latitude for useful development.

It is felt that lightness, *per se*, is a desirable feature, provided that it is secured without sacrifice of strength or of durability, and that, consequently, any make of vehicle which weighs less, in consequence of better design, or the use of superior materials, ought to benefit accordingly in the race. In any case, it is necessary that "strength" and "durability" should be actually and fully tested in the race itself (a point that is separately dealt with later), so that it is apparently unnecessary and even inadvisable, to specify any weight for the chassis. On the other hand, however, there are certain contingencies which it is difficult to guard against in any other manner, the chief of these being that a maker might, if he cared to entirely disregard cost of manufacture, build an extremely light but unreasonably expensive chassis, which would be strong enough and durable enough for its work. It is, of course, decidedly unwise to encourage one form of construction for the race, and another for the buying public, and it is conceivable that such a result might occur in this case.

The only other contingency to which we need refer is less important, because it is not only more easily dealt with by disqualification, but because it is unlikely that the motoring public would be deceived by it. It is, that the race might possibly be won by the employment of some complicated—and really valueless—auxiliary mechanism that would enable the engine to work continuously at its best speed and best load, in spite of the extra weight involved by it. From these points of view, therefore, it is probably advisable, on the whole, to impose a minimum weight, for the one reason, and a maximum weight, for the other reason, but it cannot be too clearly borne in mind why a chassis weight is specified at all, and that, whatever the selected minimum and the maximum limits may be, they may quite possibly require frequent revision as time goes on, to render them applicable to the then-prevailing practice at the moment.

The weight limits for this year's race have been fixed at 950 lbs. for the body (with its live and dead load), and at 1,300 lbs. (minimum), and 1,600 lbs. (maximum) for the chassis.

Other Necessary Restrictions.

So far, we have chiefly considered in any detail what are really the fundamental restrictions, and have carefully refrained from anything more than very brief reference to such subsidiary limitations as it may be necessary to impose on competing cars. For the most part, these minor stipulations, which now concern us, have been adequately dealt with in the rules already issued by the Automobile Club, but there are certain respects in which we think those rules might be very greatly improved, and there are some contingences against which no provision has as yet been made. Those which are apparently required in order to prevent other than *bona fide* touring cars from taking part in the race, should be specially directed to ensure:—(1) roominess and comfort of the body, (2) strength of the

chassis itself, (3) reliability and durability of the entire car, and (4) silence; they should, moreover, render it impossible for any "freak" cars to compete. In most instances, it is possible—and it is then unquestionably preferable—to meet the case by means of special rules, specifically dealing with the points at issue, but in others, disqualification at the discretion of the officials is apparently the only open course.

To Ensure Roomy Bodies.

Primarily the reason why minimum dimensions should be specified for the wheel-base, the track, the body and the seats, as also for the arrangement of the seats and the provisions of mud-guards, is that otherwise special types of car might be devised, or unfinished cars be presented, with a view of reducing "windage" or of evading the spirit of the rules in some other way. That it is necessary to impose such limits is hardly open to question, though doubtless there is a risk that some good makes of car will be excluded, unless care is taken to see that the dimensions chosen will give a fair amount of latitude. As the rules stand at present, the track (4 ft.) and the width of frame (2 ft. 6 ins.) are perhaps rather too closely restricted, but otherwise the figures that are already selected call for no comment. Although it may be urged that 7 ft. 6 ins. is nowadays very short for the wheel-base of most touring cars, yet it by no means follows that a manufacturer would suffer by exceeding this figure, and it may at the same time be pointed out that most makers already lay themselves out to build cars of different lengths.

To Ensure Strength of Chassis.

One very important matter which does not at present seem to have received attention is that some stipulations should be incorporated by which the strength of the chassis itself would be subjected to a sufficiently severe test. It is a question which in reality affects the body, for there is no doubt but that the body of an ordinary car very materially stiffens the frame, and that, for the race, a specially-designed body could be made to compensate for an unduly weak frame. It would not matter, perhaps, if the builders always supplied such cars complete, but often the chassis is alone supplied, and an ordinary body fitted by another firm. A further reason why, in the Tourist Trophy, the body should not be allowed to form a part of the frame, is that the race only lasts over a very short period, and that therefore the test imposed during that time should be exceptionally severe. There is much consequently to be said for the suggestion that all the bodies used in the race should be constructed in a special manner, being divided, say, into four parts—cut down the centre longitudinally and transversely—and having each part fixed to one member only of the frame; the body would then really consist of four independent seats, two in front and two behind. To ensure a proper distribution of the load, the weight on each portion would also have to be specified.

To Ensure Reliability and Durability.

The point to which we now come is, in our opinion, deserving of the very greatest attention, not only because it is so desirable that "reliability" and "durability" should be thoroughly proved by the race, but also because everything that is feasible should be done to induce the public to actually witness the event. In the first place, it is evident that the distance (150 to 250 miles) now contemplated by the organisers is totally inadequate

for the purpose of really testing the cars, for it hardly gives sufficient time for new vehicles to settle down into working form, or for inherent weaknesses to make their presence apparent. From the other point of view, moreover, it is certain that comparatively few members of the general public will take the trouble to travel far in order to watch a one-day race, particularly when there can be no well-sustained excitement throughout the day, and they will be unable to form a personal opinion concerning the chances of any competitor before the race is actually in progress. For both these reasons, therefore, it might certainly be advisable to prolong the race over at least two, if not three, days, on each subsequent day restarting all competitors (who had not retired through breakdown) in such a way that they would commence running in exactly the same positions that they had previously left off. For instance, the winner of the first day would start first on the following morning, the others who had completed the whole distance would be despatched at intervals of time equivalent to the lateness of their arrival, and those whose fuel supply had given out would have to start from where they stopped (or from the previous "control") at a time to be calculated for the uncompleted portion of the course (from the average individual speeds during the day), and from the relative time of their arrival in comparison with the arrival time of the winner at that spot. By this means the public, as well as the drivers, would be able to form an excellent idea of the chances of every competitor from the information that would be available each night, and this would not only give the spectators an extremely intelligent interest in affairs, but would go far to eliminate the undesirable "luck factor" from the race. It is hardly probable that the manufacturers would object to this proposal on the score of expense, for, after all, the additional expenditure involved would be quite trifling in comparison with the whole outlay involved, and it is quite certain that the entire industry would benefit enormously if a national event of this kind could be made a thorough success.

One more suggestion might also be made, with a view of still further testing the merits of the competing cars, this to a certain extent hanging upon the point with which we have just dealt. It is that different drivers should be required to handle the cars each day, in order, as far as possible, to render the race a trial of touring cars rather than a driving competition. It may be that such a course would be found inconvenient in practice, and that objections would be raised against it by those in the trade; we therefore merely bring the matter up for consideration, and do not lay any great stress upon the advisability of adopting it.

To ensure "Silence."

Unfortunately, "silence" is one of the very few "good points" which is actually put at a discount by the proposed rules, and, indeed, would be by any racing rules. It is especially regrettable that this should be so, because, on the one hand, it would not do to allow the cars to run without exhaust-boxes of any kind, and yet, on the other hand, it is virtually impossible to specify any particular degree of noise. Apparently, therefore, the only course open is for the organisers to reserve to themselves the right to disqualify unreasonably noisy cars at their discretion, and to rely upon the public and the press for making known the merits or demerits of any competing car that is conspicuous either for its quietness or its noisiness.

(To be concluded.)

RACES, RECORDS, AND TRIALS.

BRIGHTON MOTOR WEEK.

UNDER the organisation of the A.C.G.B.I., the largest race meeting of its kind was held during the latter half of this week at Brighton. No fewer than 375 entries had been received for the 23 different events which started on Wednesday of this week, the programme concluding to-day (Saturday). The track, which has been put in repair at a cost of £4,000, extends for a mile and a half along the well-known Madeira Road, and in its present condition presents one of the finest courses in the world.

Judging by the enormous number of entries—even though on an average each car represented about four entries—there can be no doubt about the feeling with regard to a sporting event of this kind, and it is only a pity that, as at present held, speed events conducted on these lines can only put a premium on speed, pure and simple, and that they therefore offer so poor a guide to the intending purchaser, who requires a reliable, and good all-round, *touring* vehicle.

ON the evening prior to the opening of the Brighton meeting, the A.C.G.B.I. held a dinner at the Royal Pavilion under the chairmanship of the Hon. Arthur Stanley, M.P., who was supported by the Mayor of Brighton and several members of the Corporation. After Mr. Stanley had proposed the loyal toasts, Mr. Bird gave the Mayor and Corporation, and, in his speech, paid great tribute to the help which the club had received from the Brighton officials. The Mayor of Brighton, in reply, expressed his desire that this meeting would become an annual event.

The Hon. Arthur Stanley, in replying to the toast of the Automobile Club, which had been proposed by the Mayor, said that although it was inadvisable at the present time to do anything which might increase the agitation against motorists, yet he was very optimistic about the new Bill, because he had observed a distinct change for the better in the attitude of the most prominent anti-automobilists in Parliament. Mr. Stanley said he was still further confirmed in this view because he considered that the industry had arrived at such a state that it could not possibly be crushed, however much some people might be against the movement. There were 58,000 cars and cycles now registered, and there were some 11,000 vehicles for purely commercial purposes on order, which in themselves represented a capital of far too serious a magnitude to be at the mercy of a few malcontents.

Colonel Holden proposed the toast of the Press, and said that the present agitation against high-powered cars was not desirable, because high power was necessary for comfortable touring. It was, said Colonel Holden, those drivers of such vehicles who do not observe due consideration for others that the Press would do well to put down.

The cars started at the East-End on a slight declivity for about 30 yards. Several of the events at this meeting were of a sufficiently diverse character to slightly vary the monotony of cars run under a classification by price basis. On the Wednesday, there was a race between a number of 15-h.p. Darracqs, a series of 30-h.p. Daimlers took their turn on Thursday, and similar events were on the programme for the other days between 15-h.p. White Steam

cars, 35-h.p. Daimlers, and 15-h.p. Orleans. The programme for each day was very similar in character, and included an event for Racing Cars. On the last day but one, there was a Ladies' Handicap Race, and the special event was the *Daily Mail* 100-Guinea Challenge Cup for Racing Cars. Saturday was occupied with two Handicap Sweepstakes—one for Racers—and the *Auto-car* Challenge Cup, open to all comers.

The events for the touring cars brought together most of the well-known makes of vehicle, while in the racing section still greater sport was promised by the entry of such cars as the 150-h.p. Dufaux, driven by the Hon. C. S. Rolls; a 100-h.p. Rochet-Schneider, entered by Theodore Schneider, besides the Napier Gordon-Bennett racers, Sir Ralph Gore's 100-h.p. Mercedes; and an 80-h.p. De Dietrich, entered by Charles Jarrott. For the *Daily Mail* Challenge Cup, Miss Dorothy Levitt was down on the programme to drive an 80-h.p. Napier, while Miss Claudia Lassell was the entrant of a 90-h.p. Mercedes.

The only times given for the touring cars was the difference between the winner (taken as Zero) and the next car. Some exciting finishes were made, notably the White Steam car in Event 4, which made a splendid spurt a few yards from the finish, and won by one-fifth of a second.

When the racers began to show their paces, interest rose considerably. Earp, in Event 7, won his race in splendid style with his 90-h.p. Napier against Hutton's 120-h.p. Mercedes. Earp's time being 45½s. (= 79½ m.p.h.), the best of the day. The Dufaux 150-h.p. racer, driven by the Hon. C. S. Rolls, was not running well, and proved a great disappointment, being hopelessly outpaced in its heat.

Neither Miller's 100-h.p. Fiat or Jarrott's 80-h.p. De Dietrich started amongst the racers. Rawlence's 90-h.p. Mercedes broke a valve just after starting, and Guinness' 100-h.p. Darracq stopped after it had gone a few yards down the course.

Results of the First Day's Racing.

Scratch Race for 15-h.p. Darracq Cars.—1st, Hugh Kennedy; 2nd, H. E. Hall; 3rd, J. Keele. Won by 5½s.

Tourist Motor Cycle Handicap (max. cyl. capy. 80 by 80).—1st, Minerva, No. 9; 2nd, Rex, No. 23; 3rd, J.A.P., No. 25. Won by 3½s.

Cars up to £200 (two passengers).—1st, Lewis' 8-h.p. Rover; 2nd, F. Wilkinson's 8-h.p. Stanley Steamer. Won by ½s.

Chassis, price from £400 to £500.—1st, Keele's 15-h.p. Darracq; 2nd, S. Wright's 15-h.p. Darracq. Won by 1½s.

Chassis, price from £700 to £800.—1st, G. H. Warne's 28-h.p. Daimler; 2nd, Miss Victoria Godwin's 30-35-h.p. Ariel. Won by ½s.

Scratch Race for 30-h.p. Daimler Cars.—1st, J. M. Gorham, No. 107; 2nd, A. Hordern, No. 102. Won by half a length.

Racing Cars weighing not more than 1,000 kilos.—1st, Earp's 90-h.p. Napier, 47½s.; 2nd, Hutton's 120-h.p. Mercedes, 53s.

Aston Hill-Climb.—The Hertfordshire A.C. held its second annual open hill climbing handicap at Aston Hill, near Wendover, Bucks, on July 15th.

Aston Hill runs through the property of Mr. Alfred C. de Rothschild, and this gentleman took a personal interest in the competition, and very hospitably entertained the company.

There were twelve entrants, though only nine faced the starter.

Each car was allowed two ascents, the best to count. Mr. C. Lorenzer, driving a 35-h.p. Beaufort down, met with a mishap within a few hundred yards of the hill. In trying to pass Dr. Kerr, a member of the club, riding a motor cycle, the Beaufort got on the rough grass at the side of the road, the steering became unmanageable, and the car plunged into the ditch, throwing the occupants over the hedge. Luckily, no one was hurt, and the frame, although parts of it were bent, did not fracture.

The following are the cars and the times:—

Car.	Driver.	mins.	secs.
24-h.p. Thornycroft ...	T. Thornycroft ...	2	7½
18-h.p. Siddeley ...	Oscar Thompson ...	2	55
10-h.p. Speedwell ...	A. J. Dew... ..	2	54½
15-h.p. Darracq ...	A. Rogers ...	3	8½
24-h.p. Beaufort ...	J. Lownds ...	2	8½
10-h.p. Alldays ...	E. Blakemore ...	2	19½
25-h.p. Delahaye ...	T. H. Wright ...	2	50½
12-h.p. Crypto ...	E. T. Pryor ...	4	56½
18-h.p. National ...	P. Lamb ...	2	39½

Eastbourne Hill-Climb.—The results of the Handicap Hill-Climb on East Dean Hill, organised by the Sussex A.C. on July 13th, have now been issued. The marks obtained and the order of merit for the whole of the 14 cars that completed the course are as follows:—

		Marks.	Time.	Class.
			m. s.	
1	M. F. Miéville's 12-h.p. Peugeot ...	122.0	5 0	B
2	M. F. Miéville's Baby Peugeot ...	96.8	6 30½	A
3	L. Russell's 10-h.p. Star ...	93.4	4 46½	B
4	Scrase-Dickins' 7-8-h.p. Talbot ...	87.8	8 20	A
5	Rev. F. A. Pott's 15-h.p. Darracq ...	87.2	4 33½	B
6	H. G. Hall's 15-h.p. Darracq ...	84.4	3 53½	B
7	G. H. Warne's 28-h.p. Daimler ...	76.6	3 55½	C
8	W. H. Tribe's 18-h.p. Peugeot ...	76.3	4 50½	C
9	J. W. Aps's 14-h.p. Daimler ...	71.0	5 56½	C
10	Guy Baxendale's 24-h.p. Thornycroft ...	67.2	3 56½	C
11	F. K. Brydges' 10-h.p. Argyll ...	59.4	6 40	B
12	G. Hennessey's 16-20-h.p. Martini ...	55.5	5 33½	C
13	S. Jones' 16-h.p. Darracq ...	53.0	7 7½	B
14	Rev. H. T. Boyd's 8-h.p. Darracq...	52.0	7 33½	A

The prize winners and silver medalists, therefore, in the several classes are as under:—Class A.: 1st prize, cup, Mr. M. F. Miéville's Baby Peugeot; 2nd, County Club's silver medal, Mr. A. Scrase-Dickins' 7-8-h.p. Talbot. Class B.: 1st prize, cup, Mr. M. F. Miéville's 12-h.p. Peugeot; 2nd, Club's silver medal, Mr. L. Russell's 10-h.p. Star. Class C.: 1st prize, cup, Mr. G. H. Warne's 28-h.p. Daimler; 2nd, Club's silver medal, Mr. W. H. Tribe's 18-h.p. Peugeot.

Mount Ceniz Hill Climb.—This annual event took place on Sunday last, before a very large gathering of people, and was also witnessed by the Queen Mother of Italy and the Duke of Genoa. Great interest was added to the meeting this year from the fact that Lancia, Nazzari, and Cagno were amongst the entrants with their splendid Gordon-Bennett Fiat cars. Unfortunately, the two De Dietrich racers did not take part. The distance was 22 kiloms., with an average grade of 1 in 8. Last year the victory was obtained by Lancia, on his Fiat, in 22m. 24½s., but this year this time was not only beaten by the two sister Fiat cars of Nazzari and Cagno, but also by Hemery, on an 80-h.p. Darracq. In the Tourist Class, another Fiat of 75-h.p. came also very near to the old time, whilst a 24-h.p. Itala light car made the splendid time of 23m. 57½s. Lancia was unfor-

tunate in losing 16 minutes at the start. The chief results were as follows:—

Racers.

Heavy Cars.—1. Nazzari (100-h.p. Fiat), 19m. 18½s.; 2. Cagno (100-h.p. Fiat), 19m. 26½s.; 3. Hemery (80-h.p. Darracq), 20m. 26½s.; 4. Vitalis (100-h.p. Rochet-Schneider), 23m. 51½s.

Light Cars.—1. Raggio (24-h.p. Itala), 23m. 57½s.; 2. Blart (24-h.p. Itala), 27m. 25½s.; 3. Brogliatti (20-h.p. Darracq), 34m. 27½s. Previous record—Ceirano, 28m. 52½s.

Motor Bicycles under 50 kilogs.—1. Riva (8-h.p. Peugeot), 24m. 5s.; 2. Maffei (5-h.p. Maffei), 24m. 33½s.; 3. Reale (7-h.p. Peugeot), 28m. 4½s. Previous record—Maffei, 29m. 13s.

Tourist Cars.

Heavy Cars.—1. 75-h.p. Fiat, 23m. 6½s.; 2. 30-h.p. Itala, 24m. 41½s.; 3. 50-h.p. Itala, 25m. 37½s. Previous record—Gandini, 29m. 43½s.

Light Cars.—1. 16-h.p. Clém.-Bayard, 41m. 34½s.; 2. 16-h.p. Rocar, 43m. 40½s. Previous record—30m. 47½s.

Voiturettes.—1. 7-h.p. Peugeot, 56m. 14½s.; 2. 6-h.p. Peugeot, 1h. 28m. 35s.; 3. 6-h.p. Peugeot, 1h. 29m. 38½s. Previous record—Alby, 1h. 30m. 54½s.

Hill-Climb and Speed Tests.—Under the auspices of the North of France A.C., the annual event for motor vehicles took place near Boulogne, from the 14th to the 16th of July. The programme included a circuit for tourist cars, during which times were taken—standing kilometre on Tingry Hill, the flying kilometre on the flat at Wizernes, and over the same distance on the Doullens Hill beyond Boulogne, the cars being also timed over 5 kilometres from a standing start. The total of these events determined the ultimate winner of a much coveted Challenge Cup presented by King Leopold II. In the result the chief times for this trophy were as follows:—

En'rant, Car, and Class.	Tingry Hill.	Flying kilom.	Doullens Hill.	5 kiloms.	Total Time.
	m. s.	m. s.	m. s.	m. s.	m. s.
1. Franchomme, 15-h.p. Serpollet (Cat. 3)	1 25 0	47½	1 48½	4 7½	7 24½
2. Ritchey, 40-h.p. Brouhot (Cat. 6)	1 40½	0 58½	1 19½	4 7	8 5½
3. Fraignac, 18-h.p. La Buire (Cat. 4)	1 59	1 12½	1 26½	4 38½	9 16½
4. Bernard, 8-h.p. Corre (Cat. 1)	3 21½	1 48½	4 3	6 54½	16 7½

On the Doullens Hill, racing cars were also tried over a half kilometre, with a flying start, for the De Caters Challenge Cup, with the result that Wagner, on his Darracq, was first in 15½ secs., and Hanriot, on a Bayard-Clement, second in 15½ secs.

Ostend Motor Week.—Last week we gave the results for the flying kilometre and for the racers over 10 kiloms., and the tourist vehicles over 5 kiloms. In Cat. 7 of the latter upon investigation the Brouhot car's time was found to be 3m. 42½s. Therefore, the Germain takes premier position in this class with 3m. 29½s.

Continuing on the following day, Wednesday, the tourist car trial was run off over 240 kiloms. for cars over 24-h.p., and 180 kiloms. for cars below that power, on a 60 kilom. circuit, starting from Ostend. 28 cars started, and 25 accomplished the course without trouble or incident. The start was at 7 a.m., and the neutralised portions *en route* on each circuit were Bruges, 10 mins.; Blankenberghe, 5 mins.; Ghisteltes, 5 mins. The results were as follows:—

CAT. 1.—Under 1,000 kilogs. weight and 15-h.p.

Class A (180 kiloms.).—1. Vivinus, 2h. 57m. 24½s.; 2. Darracq, 3h. 24m. 20s.; 3. Darracq, 4h. 4m. 44½s.

Class B (240 kiloms.).—1. Metallurgique, 4h. 12m. 22½s.

CAT. 2.—Over 1,000 kilogs.

Class A (180 kiloms.), under 15-h.p.—1. Germain, 4h. 54s.; 2. Serpollet, 4h. 4m. 9s.; 3. Hurtu, 4h. 21m. 48½s.

Class B (180 kiloms.), 15 to 24-h.p.—1. Fiat, 2h. 48m. 30s.; 2. N.A.G., 2h. 55m. 58s.; 3. La Buire, 3h. 6m. 13½s.

Class C (240 kiloms.), 24 to 35-h.p.—1. Mercedes, 3h. 50m. 42½s.; 2. Germain, 3h. 52m. 29½s.; 3. Mercedes, 3h. 57m. 26½s.

Class D (240 kiloms.), above 35-h.p.—1. Germain, 3h. 13m. 46½s.; 2. Mercedes, 3h. 28m. 41½s.; 3. Brouhot, 3h. 43m. 30½s.

CAT. 3.—Over 1,400 kilogs.

1. Germain, 3h. 33m. 11s.

On the Thursday the speed trials over the standing mile and the flying kilometre were run off, the awards being made on the combined times of the two. Guipponi, on his Peugeot motor bicycle, was again to the fore in regard to remarkable exhibition of speed. On his machine, weighing under 50 kilogs., he accomplished the extraordinary time of 27½ secs. for the flying kilometre, a speed of 132.35 kilom. (82.24 miles) per hour, whilst his time for the standing mile was 55⅝ secs. = 64.74 miles per hour, both new worlds records. These were the only new records put up on the day. The following is a table of the chief results, the rest of the week being devoted to receptions, *corso fleuri*, exhibition of the competing vehicles at the Kursaal, and the distribution of prizes.

Racers.

Motor Bicycles under 50 kilogs.

Driver and Machine.	Standing Mile.		Flying Kilom.

GLIDDEN CUP ROUTE.—Two roads passed over by the White Car during the exploring trip.

CEYLON NON-STOP MOTOR RUN.—Reading from left to right: Mrs. Forsythe, winner in Class III., on her 8-h.p. Wolseley, Mr. H. G. Sculfer on Mr. G. S. Brown's 6-h.p. Wolseley (winner, Class II.), and Lieut. Skelton on his 12-h.p. Wolseley.

Ceylon Motor Trials.—Following the example of India, the Ceylon A.C., on May 11th, held a non-stop run over a distance of 72 miles, starting from Kandy to Kegalle by the Kaduganawa Pass—a very trying descent—then to Polgahawella, Kurunegalla back to Kandy. On the last stage the Gelegedera Pass had to be scaled for four miles, with bad turnings and gradients ranging up to 1 in 8. Some excellent roads are passed over during this run, but on the whole it may be regarded as a very severe test for cars of anything but high power. The perfectly exquisite scenery is somewhat of a compensation for the trials to which owners have to put their vehicles during the "trip." At present in the Island, Wolseley cars are far away in the ascendant, and amongst the actual starters, besides motor cycles, only one other make of car was in evidence, viz., a 7-h.p. Oldsmobile, although a 8-h.p. Rover and a 16-h.p. Chelmsford car were entered, but scratched before the start. The Wolseleys totalled five, viz., three 6-h.p. cars, an 8-h.p., and a 12-h.p. A minimum

time for the course was enforced of 4 hours, and a maximum of 6 hours. Mr. G. S. Brown on a 6-h.p. Wolseley, driven by Mr. H. G. Sculfer, proved the winner in Class II. (cars under 10 cwts.), time 4h. 4m., and in Class III. (cars over 10 cwts.), Mrs. Forsythe, driving herself on an 8-h.p. Wolseley, was first, in 4h. 7m. Both the 6-h.p. Wolseleys of Messrs. C. C. S. Hodgson and H. P. Borrell were before their time, and although the latter made a non-stop run, they were necessarily disqualified. Unfortunately the little Oldsmobile could not get through in the maximum time allowed, but she was timed for a "non-stop." Mrs. Forsythe's only stop was caused by missing gear. Lieut. D. S. Skelton's 12-h.p. Wolseley lost its chance through a chain breaking. We give photographs of the winners on this page.

Siddeley-Meyan Match.—This match started on Wednesday morning, the 12th July, at 5.20 a.m., from Paris. Both cars began in fine style, M. Meyan going at a great speed, averaging about 60 kiloms. per hour for the first few hours. The Dietrich car reached Boulogne at 1.16 p.m., not having stopped for lunch, the only stop being for ten minutes about 25 kiloms. before Abbeville, owing to loss of water. There were officials to meet the cars at most of the controls, and they were much interested in the Siddeley, asking innumerable questions. The Siddeley arrived at Boulogne at 4 o'clock, having made a stop of two hours for lunch at Dieppe, otherwise making a non-stop run at an average speed of 34 k.p.h.

The cars started off from Boulogne on the morning of the 13th inst., the French car reaching Sedan at 2.15 p.m., not stopping on the route for lunch, and the Siddeley reaching Sedan at 4.56 p.m., having made a stop of two hours at Valenciennes for lunch, and averaged a speed of 35.7 k.p.h.

They both started off from Boulogne in a fog, and as the route is tortuous, both cars lost their way. Later, when

CEYLON NON-STOP MOTOR RUN.—Mr. H. G. Sculfer and Mr. Philip Ryan (Observer) reaching the winning post on Mr. Brown's 6-h.p. Wolseley, and securing the best non-stop award in Class II.

GLIDDEN CUP ROUTE.—A typical bridge over an erstwhile ford.

the mist had cleared up, the route got more difficult still, and the cars did about 25 kiloms. extra.

The cars left Sedan the next morning as usual a little after 5, and reached Vesoul in good time at a speed of 37.5 k.p.h., the travellers lunching together for the first time.

On the fifth day, July 16th, the Siddeley car, after climbing Mont Cenis within time limit at about the same speed as the Dietrich without changing sprockets, Embrun was reached at 5 o'clock, giving an average speed for 287 kiloms. of 32.5 per hour.

In like manner the next day, the 17th, was completed successfully, no points being lost from the day of starting.

On this day the Col D'Allos, 2,200 metres rise over a distance of 21 kiloms., was climbed by the Siddeley in 59 minutes.

MOTOR BOATING.

The Motor Yacht Club.—The Royal London Yacht Club have made the members of this Club honorary members of their Club House at Cowes for this season, with the exception of Cowes week, when the arrangement will be limited to those members owning boats.

For the Paris-to-the-Sea Motor Boat Race, which, for the third year, commences to-day (Saturday), a very large list of competitors are down to take part, including most of the crack racing craft which have recently come forward so prominently.

THE heavy oil carburettor employed by Herald I. when she competed for the Quinnone de Leon Cup was the "Eveno."

GLIDDEN CUP ROUTE.—A break in the mountain forest.

MOTOR CYCLING.

Auto-Cycle Club.—The annual reliability trial for auto-cycles, promoted by the club, and to which we have several times referred, takes place, as already announced, from August 14th to August 19th next. The route selected for the trial this year is over entirely new ground in the West and South of England. In order to enhance the value of these trials to the manufacturer, the route has been, as far as possible, laid through well-populated districts, and the mid-day stops and destination for each day is always in some important town.

The machines entered will be divided into the following classes:—

1. For single-seated passenger cycles.
2. Two-seated passenger cycles (A and B).
- A. Selling to the public at not more than 85 guineas.
- B. Selling to the public at more than 85 guineas.

The distance to be covered during the whole of the Trial will be 767½ miles. The following is the route suggested:—

First Day.—London, Watford, Aylesbury, Oxford, 60½ miles; lunch; Eynsham, Witney, Cheltenham, Worcester, 65½ miles. Total for the day, 126½ miles.

Second Day.—Worcester, Leominster, Hereford, Ross, Gloucester, 69½ miles; lunch; Cirencester, Malmesbury, Chippenham, Bath, and Bristol, 62½ miles. Total for the day, 132 miles.

Third Day.—Bristol, Weston-super-Mare, Bridgwater, Taunton, 51½ miles; lunch; Minehead, Exeter, 67 miles. Total for the day, 118½ miles.

Fourth Day.—Exeter, Honiton, Lyme Regis, Dorchester, Weymouth, 60 miles; lunch; Poole, Bournemouth, Southampton, 62½ miles. Total for the day, 122½ miles.

Fifth Day.—Southampton, Chichester, Brighton, 59½ miles; lunch; Lewes, Tunbridge Wells, Eastbourne, 61½ miles. Total for the day, 120½ miles.

Sixth Day.—Eastbourne, Hastings, Folkestone, Maidstone, 88½ miles; lunch; Sevenoaks, Reigate, Putney Bridge, Hyde Park, 59½ miles. Total for the day, 147½ miles.

Making a total distance to be covered throughout the Trials of 767½ miles.

In order to eliminate as far as possible the chance of a good machine being thrown out owing to tyre troubles, it has been decided this year to allow competitors to effect repairs under observation of a club official. For this purpose, a competitor who is troubled with his tyres on the road, may stop any of the competing passenger machines carrying an official observer, who will supervise the execution of the tyre repair. The time so occupied will be allowed for in each case.

Under no circumstances will a speed exceeding twenty miles per hour be allowed. Any competitor who exceeds this limit will be disqualified from taking further part in the Trials.

The entrance fee is £10 per machine, £5 of which will be returned if the machine actually starts on the first day's run. Entries at this fee close on Saturday, July 29th, after this date the entrance fee will be increased.

The number of any particular type of machine that may be entered by a manufacturer or agent is limited to one, but three machines of different types may be entered by the same maker.

It has been decided to award prizes to those riders who, together with their machines, present the best appearance throughout the trial, and a special prize, presented by Mr. A. J. Wilson, will be awarded to the lightweight bicycle accomplishing the best performance on a given formula.

Any manufacturer or agent who has not already received a copy of the preliminary Rules and Programme, should apply to the Secretary, Auto Cycle Club, 18, Down Street, Piccadilly, London, W.

The consumption test of the Club is to take place on September 2nd, the suggested route being from Thames Ditton to the top of Hindhead and back. No pedalling will be allowed, and engines must not be stopped except for traffic stops. A prize will be awarded on the basis of ten-miles per gallon, and, in addition, prizes will be given for the smallest consumption in each class, irrespective of weight.

We are glad to notice that a resolution has been passed by the Auto-Cycle Club Committee, recommending the A.C.C.B.I. to prohibit any motor bicycle running in the streets at Brighton Meeting (and we hope at all meetings) without an efficient silencer, except when actually racing. We have repeatedly drawn attention to this abuse, and are glad to see at last that some practical steps are likely to be taken to make it a cause for disqualification. The infinite amount of harm these machines do by the bad impression created amongst the general public is incalculable. We are

also pleased to notice that the Auto-Cycle Club are drawing special attention to the dirty and untidy appearance of many of the motor cyclists who are in the habit of competing in races. Many of these riders turn out covered in oil and their clothes all greasy and face and hands filthily black. The whole of the motor bicycle industry would, without question, be considerably benefited if the suggestion of the club, that these drivers should rather appear in a smart costume, and, as far as possible, be reasonably clean when driving in public races.

Blackpool Race Meeting.—It has been decided to include two auto cycle races at the meeting to be held at Blackpool on Thursday and Friday, July 27th and 28th.

Event No. 1.—Handicap for standard touring auto cycles having engines not exceeding 80 by 80, or the equivalent volume swept out. Entrance fee, 5s.

Event No. 2.—Scratch race for racing auto cycles not exceeding 110 lbs. in weight. Entrance fee, 10s.

The first prize in each event will be a silver cup, and, providing a sufficient number of entries are received, medals will be awarded to the second and third.

The classes for cars we gave on page 806, July 1st.

Motor Cycle Records.—At Canning Town track on Wednesday, July 12th, C. R. Collier, on his twin-cylinder "Matchless" machine, covered 54 miles 523 yards in the hour, beating the previous record by Barnes (49 miles 800 yards) by nearly 5 miles. His first new record was 6m. 46½s. for 6 miles (previous record 6m. 48½s.), and from this point he hauled down the records up to 50 miles easily—during which he also put up a new record for the flying start 5 miles of 5m. 28½s. (old 5m. 31½s.). The chief intermediate times, previous records, and holders, were as follows:—

Miles.	C. R. Collier.		Previous Best.		Holder.
	m.	s.	m.	s.	
1	1	14½	1	14	H. Martin.
5	5	40½	5	39	H. Martin.
10	11	16½	11	14½	T. Tessier.
15	16	47½	16	47½	E. Tessier.
20	22	9½	23	9½	J. Crundall.
25	27	39	28	49½	J. Crundall.
30	33	8½	34	33½	J. Crundall.
35	38	38½	41	59½	G. Barnes.
40	44	7	48	18½	G. Barnes.
45	49	41½	54	21½	G. Barnes.
50	55	16½	60	42½	G. Barnes.

One hour record: 54 miles 523 yards.

THE University of Liverpool Motor Club, on July 13th, held a hill-climbing contest on Parbold Hill. This hill has an average gradient of 1 in 15½, the steepest portion being 1 in 8½. The total length being a little over three-quarters of a mile. Medals were given for the best performance, as shown by the formula, $HP \cdot G \left(WC_1 + \frac{C_2}{T^2} \right)$ where C_1 and C_2 are constants depending on the hill.

Rider.	Machine.	Figure of merit.	Speed in m.p.h.	
R. L. Hall	2-h.p. Waverley Minerva	1'155	20'6	Gold medal
R. S. Royle	3-h.p. Addison	1'07	30	Silver medal and quickest time
Atherton	3-h.p. Addison	1'041	28'7	
R. L. Hall	3½-h.p. Waverley	1'01	27'2	
Atherton	3½-h.p. Addison Tricar	1'07	13	Silver medal
R. S. Royle	3½-h.p. Addison Tricar	1'018	13	

The rest did not get up.

Muratti £150 Trophy.—For the first time in the history of the sport, a contest extending over two days was carried to a successful issue by the Ulster Centre of the Motor Cycle Union of Ireland. The event was a 400 miles reliability run from Belfast to Dublin and back, and from Belfast to Londonderry and back. The contest was open to any amateur cyclist, the prize being a

handsome trophy presented to the Union by Messrs. Muratti, Sons and Co., Limited. The course was divided into two sections, the first, that from Belfast to Dublin, being run on Thursday, and from Belfast to Londonderry on Friday. Each section was divided into sub-sections, and a schedule drawn up with the hour for arrival at each checking station, so that in the case of two or more riders scoring an equal number of marks, the rider who approaches nearest to the schedule will be declared the holder of the trophy.

Controls were established at Dundalk and Dublin on the first day, and Limavady on the second—a stay of two hours being compulsory at Dublin and Limavady. Twenty-two competitors started on the 13th from Balmoral at 7 a.m.

Collisions, minor accidents, and chiefly punctures, put the majority of the riders out of the competition in the early stages, one unlucky rider, J. S. Garrett, recording eleven punctures in the first five miles.

H. Williamson, on a Rex, who was riding immediately behind the leader, came to grief at Swords, where he had a marvellous

escape from death by a bolting horse in a hay cart in charge of a youngster. The schedule time of arrival at Belfast was 6.49, and at that hour nine of the competitors had arrived.

On the second day, Friday morning, the start was from the Shore Road, Belfast, when nine, who finished on the previous day went away. Londonderry was reached at 3 o'clock, and the return journey entered on, the finishing point, which was at Coramoney, seven miles from Belfast being reached as under:—

			h.	m.	s.
F. Hulbert, Coventry (Triumph)	7	1	49
L. L. Wilkinson, Belfast (Minerva)	7	1	50
J. P. Burney, Belfast (Enfield)	7	2	5
R. M. Bryce, London (Brown)	7	2	41
E. A. Lowe, London (J. A. P.)	7	6	45
I. Stewart, Belfast (Triumph)	7	25	26

After investigation, the committee awarded the Trophy to R. M. Bryce, E. A. Lowe being second. No third placed.

CLUBS AND ASSOCIATIONS.

MOTOR UNION MEET AT CHESTER.—Visit to the Duke of Westminster's seat, Eaton Hall. View at the Hall. The Hon. Cecil Parker, who received the members of the Union, personally directing the cars upon their arrival.

Photo by R. Banks, Manchester.

Motor Union Meet at Chester.—The meeting of the Motor Union at Chester, to which we drew attention last week as about to be held, duly came off on Saturday last, and brought together a large gathering of motorists. The subject on which the chief activity of the committees appointed by the Union was concentrated, referred to the burning question of the hour—the elimination of the road hog, and the diminution of reckless driving on our highways. Very rightly, the committee assumed one of the principal causes of the evil to be the widespread employment of the foreign chauffeur, and they accordingly proposed to adopt measures for rendering the employment of home-grown drivers more general. The general education of English mechanics for this purpose would have the additional advantage of increasing the amount of lucrative employment in the country, and largely get rid of the reckless driving nuisance at the same time.

At the dinner, which was held at the Grosvenor Hotel in the evening, the Hon. Arthur Stanley, M.P., chairman of the Automobile Club and of the Motor Union, delivered a well-considered and tactful speech on the situation. He believed that the Motor Union had done enough to convince everyone that they desired to stamp the road hog out of existence. At the same time, however, they were banded together to defend their just rights as motorists, though they did not lose sight of the fact that others possessed rights

as well as themselves. Mr. Stanley further deprecated the use of the phrase "police traps," declaring that the Chief Commissioner of Police in London had told him that instead of setting a trap to catch as many motorists as possible, they simply informed motorists of complaints that had been made in regard to fast driving in any particular road, as this road was under observation.

In Brighton, Sheffield, Nottingham, and elsewhere, the police, it will be remembered, have adopted a somewhat similar line, communicating with the local automobile clubs when they have anything to complain of, with the invariable result that the best of feeling prevails, and the law is universally obeyed. Unfortunately this course of action is still somewhat exceptional. If Lord Stanley had spoken a few words in deprecation of the police traps set on lonely roads in the open country, he would have rendered his picture of the present situation more complete, and would have drawn further attention to what everyone recognises as an abuse of executive.

Berkshire A.C.—Lieut.-Col. Waring having been ordered abroad, the duties of hon. sec. will be performed, during his absence, by Mr. Walter L. Bourke, Moneycrower, Maidenhead, to which address all correspondence should be sent.

Tilting at the ring.—1. E. A. Rosenheim's 10-h.p. Argyll; 2. Gordon Chapman, 28-36-h.p. Daimler.

None of the competitors in the tortoise race finished, and consequently there was no award.

The programme concluded with a balloon chase by motor cars, the balloon proving the winner.

Society of Motor Omnibus Engineers.—A meeting was held last week when it was decided to form a new body under the above title. The first council was constituted as follows:—

Mr. F. C. A. Coventry, Great Western Railway.

Mr. R. Bell, London Motor Omnibus Company.

Mr. H. P. G. Brakeridge, London Road Car Company.

Mr. K. H. Buchanan, London Power Omnibus Company.

Mr. W. F. French, Sussex Road Motor Company.

Mr. P. F. Smith, Tillings, Limited.

Mr. W. M. Hodges, London and District Motor Bus Company.

Mr. G. Pollard, Birmingham Motor Express Company.

Mr. W. Spiller, London General Omnibus Company.

Mr. W. T. Smith, Eastbourne Corporation.

Photo by R. Banks, Manchester.

MOTOR UNION MEET AT CHESTER.—A group of the Committee of the Union at Eaton Hall.

Liverpool A.C. Gymkhana.—The gymkhana organised by this club at the Polo Ground, Childwall, on Saturday last, proved a very successful function, the proceedings being helped by the band of the 4th V.B. King's (Liverpool) Regiment. The five events on the programme attracted no less than 123 entries, the following being the results:—

Bending race.—1. A. E. W. Todd, 12-h.p. Richard-Brazier; 2. E. W. Pickmere, 5-h.p. Locomobile.

200 yards sprint handicap.—1. W. L. Goodman, 30-h.p. 6-cylinder Napier; 2. E. W. Pickmere, Locomobile.

Lady passengers' race for 4-seated cars.—1. Hugh Nelson, 7-h.p. Panhard; 2. A. R. Rathbone, 8-h.p. Richard-Brasier.

Society of Motor Manufacturers and Traders.

—For the ensuing year Mr. Sidney Straker has been re-elected President of the Society, and Mr. H. G. Burford and Mr. E. M. C. Instone,

Vice-Presidents. The Committee of Management elected from the council are as follows:—Messrs. H. Sturmey, S. F. Edge, Harvey du Cros, G. du Cros, Charles Jarrott, A. G. Williams, H. Austin, Frederic Coleman, Claude Johnson.

MOTOR UNION MEET, CHESTER.—At the meet of the Union on Saturday last, amongst the large number of cars present, there were no less than nine Rolls-Royce cars of various types in the gathering. The above is a photograph of these grouped together, and it forms a remarkable testimonial to the manner in which these cars, introduced comparatively speaking so recently, are being rapidly absorbed by automobilists throughout the country.

Mr. Rolls is on the left side of the group on an unfinished 6-cylinder car.

Haywards Heath Motor-'Bus Service.—All parts of the country are now trying the benefits of local motor 'bus services, and Haywards Heath is the most recent district to have its attractions enhanced by this speedy type of public vehicle. A 24-h.p. double-decked 'bus has just been supplied by Messrs. Dennis Bros., for service between Cuckfield and Lindfield; and on Thursday, the 13th inst., the vehicle underwent a trial run under the observation of several members of the Press.

The 'bus chassis is of the standard "Dennis" type, and embodies the worm-driven back axle and spring drive, which are the special features of Dennis cars. The driving wheels have staggered spokes, and run on tubular extensions of the axle-casing. The axle-casing is itself carried between horn-plates, instead of being tied to the frame by radius rods, and the twisting stress which comes on this mem-

Hayward's Heath new Motor 'Bus, which has just been supplied by Messrs. Dennis Bros.

View showing the Dennis worm-driven back axle, which is a special feature of all Dennis motor-vehicles.

ber is taken up by a spring-suspended torque-rod. The double-decked body has a seating capacity for 34 passengers, and Messrs. Dennis Bros. estimate the cost of up-keep (including depreciation, &c.) at 5½d. per mile run when loaded. The first cost of the

vehicle complete is £850, and depreciation is allowed at the rate of 15 per cent. per annum. The full consumption is calculated on an average of 6 miles per gallon when loaded, and four complete sets of tyres, at £36 per set, are allowed each year.

GLIDDEN CUP ROUTE.—Two methods of how the pioneer White Car replenished its water.

In the above illustration we show a very charming motor carriage which has been specially built for Dr. Harman Brown, of Coventry, by the Swift Motor Company, Limited. Dr. Brown is the first medical gentleman in Coventry, we understand, to adopt the motor car, but with such a specimen vehicle in daily evidence, many others can hardly fail to follow his good example. The car is fitted with a 3-cylinder engine developing 8-10-h.p., and has a standard pressed-steel frame.

MR. F. J. WILLIS, one of the Inspectors of the Local Government Board, held an enquiry on Wednesday in last week, at St. Albans, in regard to the application of the St. Albans City Council for the declaration of a 10-mile speed limit in that city. The application was supported, as usual, by the Town Clerk, the opposition on behalf of motorists being in the hands of Mr. Rees Jeffreys. A number of witnesses were examined, and it was elicited from the Town Clerk that, in his view, Section I. of the Act would have been much more effective had no speed limit been introduced into that measure at all—a point on which it will be remembered THE AUTOMOTOR JOURNAL laid considerable stress at the time the Act was under discussion. After the conclusion of the enquiry, which lasted some five hours, the Local Government Board Inspector made a tour of the city to inspect those portions to which attention had been called, in a *motor car*.

When the first White Steam Cars came out, they were very different looking affairs from the present machines, and largely resembled an American trotting buggy with the horse cut off. One of these "antiques," of which quite a number are in use in various parts of the world, is still running well in Johannesburg, and capable of carrying two stalwart Matabeles armed with the traditional knobkerries as shown in our photograph. The little car which we illustrate was one of the original 6-h.p. type and it is a good testimonial to the workmanship which—even at that date—the White Company put into their cars, that while most steam cars of similar appearance are now adorning the scrap heap, the Whites of the same date continue to do good service.

A 20-h.p. Thornycroft Petrol Omnibus, employed in regular service in London by the Midland Railway Company between King's Cross, Charing Cross, and Victoria Railway Stations.

ON Tuesday last the Bill promoted by the London County Council, to bring their trams over the bridges and along the Thames Embankment, which had passed in the House of Commons by the narrow majority of 1, was rejected by the House of Lords, by 64 votes to 33.

APROPOS of the fact that the Huddersfield branch of the Yorkshire Automobile Club last week took sixty of the patients out for an automobile run, *Punch* observes: "It is pleasant to remember that the relations between motorists and hospitals have always been close."

ON Saturday last, the annual outing of the Wolseley Tool and Motor Car Company's employees took place, when two special trains conveyed a large party of workmen and their friends to Portsmouth by Midland Railway, where a very pleasant day was spent. Special permission of the Admiral Superintendent had been accorded to the party to visit the dockyard, and the rest of the day was passed in making sea trips round the Isle of Wight, or to Portsmouth, Southampton, and Swanage. The weather throughout the day was brilliantly fine, and the trip in every way most pleasant and enjoyable.

APROPOS of the education of motor car drivers, the Education Committee of the L.C.C. have recommended an equipment grant of £550 to be made to the Governors of the Regent Street Polytechnic to provide for the establishment of classes for the instruction of motor car drivers. Of this sum, some £350 is to be spent on a motor car for teaching purposes, and £200 upon accessories, principally various types of engine. The Polytechnic propose to engage a special instructor to teach driving, and anticipate that the extra expenditure will be more than covered by the students' fees.

MR. MAX PEMBERTON, the well-known novelist, has been contributing to the columns of the *Daily Mail* a scorching indictment of police methods and police persecution adopted in regard to automobilists. He goes over the familiar ground, and repeats most of the views with which we are familiar; but of course the point is that he puts in a terse and amusing manner some of the humorous absurdities perpetrated. Thus,

"In a solemn tone of voice the Chairman of the Bench commended the merits of the donkey-cart, and denounced the wickedness of those who believe that the motor industry is ultimately to be the greatest this country has ever embarked upon.

A local Bench believes that our high roads were built for chickens and governess carts."

And this is how he sums up the police trap:—

"The motor trap has few teeth; but they close relentlessly upon the pockets of the victims, clutching the innocent and the guilty alike in the magisterial embrace.

As a measure for the protection of the public, the motor trap is the least effective contrivance known to the law. As a satire upon village justice it is often supremely successful."

THE first petrol motor cab that has ever been to the House of Commons approached the sacred gate last week and took away a member in the ordinary course of business without attracting much attention. It was in 1899, we understand, that the first motor car entered Palace Yard, and six years later we have the first petrol motor cab there; though, it must be remembered, that in the old days of the yellow electric cabs those vehicles occasionally invaded the sacred precincts.

THE 38th annual Exhibition of the British Medical Association opens on the 24th inst., in the Drill Hall, Newarke, Leicester. The Association is making a special feature of the exhibition of motor vehicles, &c., suitable for use by the medical profession.

Another view of the Midland Railway Company's Thornycroft Omnibus, which has a 4-cylinder engine and a single chain "drive" to the back axle. The chassis is similar to that employed by the makers for their 2-ton petrol luries—described in our issue of April 29th last.

COMMERCIAL POINTS.

THE genuine French "D" Oil, for which the United Motor Industries, Ltd., are sole wholesale agents in this country, was, we learn, used exclusively on the winning Gordon-Bennett car this year, and also in the French Eliminating Trials for the Gordon-Bennett Race; no less than twenty-two out of the twenty-four cars were lubricated by this genuine French "D" Oil.

MR. A. HIRST has joined the Simms Manufacturing Company, Limited, and has taken up the management of the magneto department.

MOTORISTS touring in France may be interested to learn that they can get their tubes and covers repaired by the H.F. process, which has come into such prominence in this country, at Messrs. Harvey, Frost and Co.'s Paris branch, 79, Rue des Archives, where the H.F. vulcanizers are in regular operation. It may also be pointed out that these appliances are to be found in practically every French town of importance, owing to the growing requirements for vulcanized repair work.

MESSRS. OLIVER, MORRIS, AND BALL, of Grosvenor Works, Tunbridge Wells, advise us that they have added to their business of carriage builders a department to deal with motor cars and accessories. For this branch Mr. E. Bruce Ball, A.M.I.M.E., &c., has joined the firm. In addition to having fully-equipped workshops for the repairs of cars, provision has been made for a large garage.

THE British Empire Motor Trades Alliance has received an enquiry for the names and addresses of British firms who press by machinery planished steel or aluminium bucket seats for automobile bodies. Firms who can fulfil these requirements are requested to communicate with J. B. King, secretary, at 11, Red Lion Square, W.C.

PICTURE Post-Cards are so much the present craze that they have become quite a distinct branch of advertising, and the Continental Tyre and Rubber Company have, in order to keep pace with the times, issued a humorous set of coloured post-cards, which may be obtained by any of our readers simply for the trouble of writing to the company for them.

IN Göteborg in Sweden, with its fine harbour and shipping business, the "Board of Trade Journal" informs us, on the authority of the United States Consul (as usual), there is a considerable demand for petrol motors, for pleasure launches and boats, for kerosene motors for fishing boats, barges, and small tug boats, and for small cheap motors which can be readily fitted in open row boats. Presumably, therefore, machines of the rudder motor type, which can be hung on the stern of the boat, ought to find a market in Göteborg.

NEW COMPANIES REGISTERED.

Chichester and Selsey Motor Omnibus Company (Limited).—Capital, £20,000 in £1 shares (19,900 ordinary and 100 deferred).

Petromobile Company (Limited), 17, Basinghall Street, E.C.—Capital, £500 in 1s. shares.

"Vico" (Limited), 14, New Burlington Street, W.—Capital, £50,000 in £1 shares (10,000 six per cent. cumulative preference). Object, to acquire from G. Stuart Ogilvie, J.P., certain patents relating to improvements in tyres and wheels for road vehicles. First directors, E. Marshall Hall, K.C. (chairman), S. F. Edge (managing director), G. Stuart Ogilvie, J.P., and C. Sangster.

X-Electric Accumulator Company (Limited), 18, Leadenhall Street, E.C.—Capital, £60,000 in £1 shares. Object, to acquire from F. L. Oppermann, of 21, Ashworth Mansions, Elgin Avenue, W., certain inventions in relation to the manufacture of accumulators.

THE Ceylon Motor Company, Limited, has been registered in Ceylon with a capital of Rs250,000 divided in Rs100 shares. The first directors are Messrs. W. S. T. Saunders, W. Shakespeare, and Robert Davidson.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

623. 12th January, 1905. Improvements in Metallic Axles for the Wheels of Road Vehicles. Hugh Butler, of the Kirkstall Forge Company, Kirkstall Forge, near Leeds. This invention refers to those axles for the wheels of road vehicles which are composed of rolled steel, in which the bed extending between the barrels is constructed of a length or lengths of rolled steel of girder formation, and the barrels which are made with an enlarged butt-end or flange are fixed to the ends of such a bed, and the object of the invention is to reinforce the joint made between the end of the bed and the barrel which is fixed thereto. There are eleven figures. Fig. 1 is a sectional elevation of the axle end. The bed consists of a girder of H-section, having its web, 1, vertical, and its flanges, 2, 3, horizontal, the ends, 4, 5, of the flanges being divided from the web, the upper flange, 4, being bent upwards and the lower flange, 5, downwards. Each barrel, one for attachment to each end of the bed, has an axial recess to receive the projecting web end, 6, of the bed, and the upper and lower portions of the flange, 7, which is formed on the inner end of the barrel present a surface to which the bent ends, 4, 5, of the bed flanges are secured. The bed flanges, 4, 5, preferably, and in the construction shown, enter recesses in the barrel flange, 7, and inwardly projecting ears, 8, 9, are formed on the barrel flange which are bent laterally over the bed flanges, while horns, 10, are formed on the inner face

flanges of the bed are fixed, while the other ends of the diagonal stays, 11, 12, extend to the upper and lower faces of the flanges of the bed to which they are rivetted, and thus a diagonal bracing is provided, which is found to greatly add to the strength and stability of "built up" axles of this type. June 29th, 1905.

17705. 15th August, 1904. Improvements in Vapourisers. The British Thomson-Houston Company, Limited, 33, Cannon Street, London. A Communication from the General Electric Company of Schenectady, New York, U.S.A. This is a vapouriser for supplying fuel to internal combustion engines, and the object is to maintain a supply of hydro-carbon vapour under constant pressure, the vapour to be mixed with air and supplied to the engine in the usual manner. A receiver is provided to which the oil is supplied under pressure, in which

from the engine are caused to pass in the direction shown by the arrows. The vapour generated in the chamber is drawn off through the pipe, c; d² is the supply tank or reservoir from which fuel is fed to the vapouriser through the pipe, d, which has two branches, d¹ and d². Each branch has a check valve. The valve, f, in the pipe, d¹, opens toward the vapouriser, and the valve, g, in the pipe, d², opens towards the pipe, d. The pipe, g, is also controlled by a hand-valve, e. When the chamber is filled to the required level the hand-operated valve, e, is closed until the proper degree of vapourisation takes place, after which the valve may be opened, and should be left open during the working of the apparatus. The exhaust heat causes the liquid fuel to boil. When the pressure of the vapour in the chamber becomes sufficiently great to overcome the pressure of the oil in the pipe, d, the vapour will pass out through the pipe, d², past the loaded valve, g, and into the pipe, d, where the vapour is condensed by the cold oil. If the oil rises in the vapouriser above the upper branch pipe the vapour pressure will force the surplus oil out through the pipe, d². The pipe, d¹, admits oil to the chamber when needed, and the vapour is taken to the engine by way of the pipe, c. June 29th, 1905.

PASSING EVENTS.

Oxinebriation.

ONE of those sprightly writers, the frisking and curvetting of whose pens in the columns of the half-penny daily Press are an ever renewed source of delight to the reading public, has got another theory—a quasi-medical one of course. We are not quite sure whether it is his hundred and nineteenth or his hundred and twentieth new theory, but, like all the others, it is amusing. One writer professes to hold the opinion that speed mania is a special form of intoxication—oxygen-intoxication to wit. Many of us have seen the unkind experiment of putting a blue-bottle fly into a bottle of oxygen, when he buzzes about in a state of wild excitement until he ultimately falls down dead. This has no doubt been observed by the writer to whom we refer. He has also no doubt heard that the same thing occurs to human beings if they inhale the gas in large quantities, and that a mild form of intoxication is experienced by people climbing elevated mountains. Our writer concludes that they are the same thing. As a matter of fact they are the opposite to one another. The mountain intoxication is due to want of oxygen. That, however, is a trifle, and does not at all stand in his way in drawing the conclusion that the reason people drive recklessly on our high roads is that going through the air at high speed in a motor car produces oxygen intoxication in much the same way as climbing mountains does not. The unfortunate part of this argument is that logically one should not become intoxicated until after one has developed high speed, and therefore it is the old familiar fallacy of the cart before the horse. We wish the matter were quite as simple, for then the speed mania could be cured by appropriate dosing, which might be administered in a liquid and even palatable form, and there would be no need for such drastic and unpleasant remedies as proposed by Mr. Soares and others, of clapping the offenders straightway into gaol. It would only be needful to give them something in their tea and they would at once be reformed. We like the idea, and this must be said in favour of it, that nothing has so thoroughly succeeded with ordinary inebriation as suitable dosing.

Tourist Trophy Symposium.

OUR readers who are interested in the Tourist Trophy question—and we trust that this discription applies to them all—will find the concluding instalment of our special article published this week, and followed by the first foretaste of the coming harvest of discussion on this fruitful subject. We anticipated that the discussion which we have opened on this highly important question would be general and representative. But we must admit that the enthusiastic character of the response to our invitation for correspondence, the number of letters we have received, and the extent to which all the leaders in the automobile world have taken part in the discussion, has even exceeded our anticipations. No better proof of the extent to which those who are at present guiding the movement are on the alert as regards everything that can affect its welfare than is supplied by this fact, can be asked for, and no one can desire a better proof of how widely the importance of the Tourist Trophy as a coming national event is recognised.

Our Attitude Not Critical.

FROM some of the letters which we have received, and from more or less informal discussions on the question, we find that there are just a few people who have misunderstood our attitude, and are grasping the situation at the wrong end. We refer to those who imagine that our articles on the subject form a criticism of what has been done already by the A.C.G.B.I., and of the rules which have been promulgated for this year's event. We should have thought it quite unnecessary to point out that this is an absolute misapprehension. On the contrary, we have repeatedly stated, and would again state, that the rules for this year's event as promulgated by the Club form a most admirably well thought out programme for obtaining the objects aimed at.

Never yet was there a scheme promulgated by man which could not be improved upon, and nothing in the nature of a hostile or critical attitude is involved in considering the whole question of racing rules and regulations from an abstract point of view, and pointing out that the conclusions to which such a consideration leads, involve further elaboration of the rules actually proposed. That this consideration naturally leads to the formulation of somewhat different proposals from those that the club has put forward can excite no surprise, particularly when we consider that, so far, the club has only had in view one single class or category of competitors, and that the race this year—for which the existing rules have been drawn up specifically—is bound to be more or less of an experimental character. Some of the letters which we have received for publication show quite plainly that the leading members of the Automobile Club fully understand and appreciate our attitude in the matter.

The Wisdom of an Allied Trade.

THE Institute of British Carriage Manufacturers has always been a progressive institution, and has done its best to march with the times. It is therefore specially appropriate that it should be possessed, in the person of its president, Mr. G. J. Jacobs, of a business head possessing a singularly broad and, at the same time, powerful grasp of the present-day requirements of the industry which his institute represents. For solid wisdom and incisiveness commend us to the presidential address which Mr. Jacobs delivered to this year's annual meeting. For an accurate and carefully considered presentation of the position which the automobile industry, in its various branches, now occupies, and is likely to occupy in the future economic development of the country, we have not seen anything to surpass Mr. Jacobs' presidential address. In fact there are large portions of it which are fully worthy not only of the attention of the carriage builders and other allied industries, but of our legislators and political economists. Mr. Jacobs has the true constructive historic imagination, for he realises that had the motor car obtained anything like its present degree of development before the introduction of railways, it would have proved a much more formidable competitor. Considering the amount of cutting and tunnelling that had to be done for the railways, Mr. Jacobs evidently thinks it is possible that in that case railways might not have developed at all, being replaced instead by automobile road traction. It is an interesting speculation, but in this country there is always a great degree of driving force behind any move

ment that requires enormous capitalisation. The explanation being that once the initial difficulty of capitalisation is overcome, such undertakings have an enormous amount to give away, and can bring such influence to bear in the way of commissions or otherwise, that they are placed in a very advantageous position in competing with possibly more useful but less powerfully-capitalised concerns. We see this sort of thing at the present day very forcibly illustrated by the recent municipal history of the electric tram development, particularly in London.

♦ ♦ ♦
"The Survival of the Fittest" should Triumph.

WHERE Mr. Jacobs deals with the proper attitude that an independent, though allied, industry should adopt towards the new locomotion, his observations are models of common sense and reasonableness. The proper line to adopt, he maintains, is to recognise that the law of the survival of the fittest is inexorable, and that it is the duty of the individual to prevent as far as possible vested interests from causing loss to the community by hampering the natural operation of this beneficent law. From this point of view, the future of the automobile movement is assured, and consequently carriage builders may successfully look to it to supply them with more than a compensation for what they may be losing in the manufacture of horse-drawn carriages. Mr. Jacobs' width of view, and how fully he is entitled to be heard on such a question, may be suitably illustrated by a few of his observations:—

The advantages of the movement are not merely those of offering an alternative means of locomotion, but the up-to-date motor may justly be regarded as embodying a combination of the highest results of modern science and engineering, and there is no doubt that in an indirect way it will assist in advancing or revolutionising other branches of engineering.

And again:—

The fascination of such discoveries as these, and the delight of using the newly-born appliances, have given immense zest to the adoption of the motor, and have also educated the general public to a greater extent in the knowledge of the principles of elementary practical engineering during the last three years, than would have been possible in the same time by any amount of State organised technical instruction.

While his view of the future prospects of the industry, and the rôle it will play in the national life, are well illustrated by the following:—

When the motor car has proved that its existence in such numbers as to encroach seriously on horse traction is a *necessity*, even as a sport, then will the capitalists be found who will do for it what has already been done in far greater measure for coach roads, canals, and railways, by providing suitable tracks for its operation, and this provision will, at the same time, protect the rights and the lives of pedestrian and equestrian travellers on high roads, and relieve them of the hardships of grievously unfair discomforts.

After this it seems to us that Mr. Jacobs is a little timorous in his advice to the members of his profession. He seems to think that they incur some danger should they go too enthusiastically into automobile body manufacturing, and seems rather to dread that the pleasure automobile, with which of course they are chiefly concerned, may prove to be something of the nature of a passing craze, and that ultimately when the novelty of it is worn off society will return *a ces premiers amours*, even though the commercial vehicle may go on and prosper, and go back to the hippomobile. Mr. Jacobs and the other carriage builders may dismiss that fear from their minds. Horses will always be kept, no doubt, for riding and hunting, and even perhaps as pets. But that the day will dawn when the man who has become

accustomed to the extended range of action will voluntarily go back and seek his pleasure in the hippomobile is as likely an event as that we shall live to see the maxim gun abandoned for the cross-bow of our ancestors.

♦ ♦ ♦
A Vision of the future.

AMONGST the things the motor car may do for us in the near future is to depopulate or partially depopulate our towns. This may not sound pleasing, but what it, of course, means is that it may probably have the effect, to a very large extent, of taking back to the land a large proportion of the population that has flocked into the towns for the sake of the greater conveniences and the greater facilities for obtaining work which are, or used to be, there available. This, at any rate, is the view of Mr. F. E. Baines, C.B., formerly leading official of the General Post Office, and his view is of more importance than that of a good many prophets, speculators, or dreamers, because, knowing the work of the Post Office, he is of opinion that the Postmaster-General ought, and might effectively and profitably come to the assistance, of such a movement. This would be done by the Post Office granting a subvention to a motor mail service which could also be arranged to carry passengers. Then Mr. Baines points out that parish councils have also power to contribute a certain amount of money to any scheme which benefits their districts. If the Post Office and the rural councils could be got to join, either with or without external backing, we might see such a passenger service established to a very large number of villages, and then we might witness to a large extent the reversal of the movement which characterised the greater part of the nineteenth century.

♦ ♦ ♦
Pity the Poor Ratepayer.—We have seen no better presentation of the case for the motor 'bus *versus* the tram than is provided in a letter by Mr. Edward Bond to the general press, which we accordingly reproduce in full. Mr. Bond writes as follows:—

Please allow me to call the attention of "The Ratepayers' Conference," recently presided over by the Duke of Norfolk, to the following points:—

Why spend more millions of the ratepayers' money in laying down new tramways when private enterprise is already at work in placing motor 'buses on the streets?

The motor 'bus is a great improvement on the tramcar. It is faster in practice, because it can, in the event of a block, pass off into another route. It is less dangerous to life, and does not ruin the roads by wires or conduits. Tramcars have the following disadvantages:—

1. Their wires, or their conduits, drive away "carriage people," to the serious disadvantage of shops.
2. They are very costly to put down and to maintain.
3. The wires are very liable to come down and kill outside passengers, especially during the winter, when loaded with frozen snow.

If millions must be spent in relieving traffic, let it be done as follows:—

1. In the construction of two great trunk roads running east and west and north and south.
2. In the building of artistic bridges over crossings.
3. In the widening of certain streets.

Here are ample ways of spending more millions, without entering into rivalry with private enterprise.

Comment on the extreme condensation and unanswerable logic of this communication would only weaken it, and we would point out that it amounts to a very drastic condemnation of the report of the Royal Commission on London Traffic, and a very ample justification of the minority opinion held by Sir George Bartley, Sir Joseph Dimsdale, and Sir G. Gibb.

THE BRIGHTON RACE MEETING.

BRIGHTON MOTOR MEETING.—1. The run down to the starting line from where the racing cars were timed for the flying kilometre. 2. The end of the course, where the cars pulled up after passing the winning post.

To organise and to control a motor race meeting extending over four days, and comprising a total of some 375 entries, is a task of no mean magnitude. To do it

successfully is worthy of praise, and this congratulation we have no hesitation in giving to those organising officials of the club who were more directly responsible

1. Mrs. Neville Copland on her 12-h.p. Talbot, and Mrs. Maud Manville on her 35-h.p. Daimler.
2. Miss C. Brown on her 10-h.p. Cupelle, and Mrs. Herbert Lloyd on her 30-h.p. Daimler.
3. Mrs. Guy Hardy ready with her 10-h.p. Panhard.

BRIGHTON MOTOR MEETING.—LADIES' HANDICAP RACE. AT THE STARTING POINT.

for the general success of the meeting. We have already mentioned the important part which the hospitable people of Brighton played in the proceedings prior to the actual meeting, and it is only fair to commend them now for the admirable patience with which they viewed the almost interminable procession of cars on the four eventful days. Some—and there were an even greater number on the second day than on the first—clung lustily to the thin wire fence which borders the track on the seaward side, and there they stayed for a full five hours per *diem* watching the cars go by, occasionally being rewarded by a close finish, at intervals, being gratified by the roar of a racer at speed, and ever and anon finding slight verbal relief in derisively cheering some belated wanderer whose engine refused (either because it couldn't or wouldn't) to move the car at a speed more nearly equal to that of its ill-matched rival. There were others—and in justice to the prosperity of Brighton it must be said they were

in the majority—who occupied seats, which they paid for in advance, on the elevated terrace extending for some three-quarters of the full length of the track. Here those who were lucky enough to obtain seats (for there was, we noticed, a certain disregard for proprietary rights as established by corresponding numbers on tickets and chair-backs) could view the course for a considerable distance, although they, so to speak, looked down on everything that passed.

High up above them all was the energetic secretary, Mr. Orde, who while doing his best to please all men “when on earth,” was in far too exalted a position up in his conning-tower to be a prey to the worries of the unofficial world below. Although so far removed, Mr. Orde could not have been in a better place from which to control the proceedings, he could see the whole track from end to end, and the interior of the tower was fitted up as a veritable telephone exchange, from which wires placed him in touch with every point on the course.

Originally it was intended that no times of any description whatever should be published for the touring cars, but in the end and mainly owing to the endeavours of Mr. H. Massac-Buist whose mind was troubled at the thought of no statistics for the *Morning Post*, the Races Committee came to a compromise and decided to publish the time differences between competing cars. This entailed a certain amount of additional labour for the timekeepers, Messrs. T. H. Wollen, Ebbelwhite, Dutton, and Glazebrook, but they made light work of it, and through the agency of Mr. H. Sturmey the results were in the hands of the Press with an expeditiousness that has not always characterised official announcements on similar occasions. The compromise, while it relieves the club from a virtual declaration of speed, cannot be considered as of any real value to the public, and we merely give the "won by" times in our table of results for what they are worth. The winning car of each event may be taken as having generally done the best average performance throughout, but the second car need not necessarily have

made a meritorious performance at all, and in any case there is nothing to show which car actually did make the best time over the course.

Everything went off so excellently at the Brighton meeting, the management was so good, and the events conducted so absolutely without anything approaching a hitch, that universal regret will be felt that the shadow of a fatal accident has been thrown—not on the meeting itself but upon its near neighbourhood. We refer, of course, to the catastrophe with the 80-h.p. Napier racer, in which Mr. Brown was concerned, on the Newhaven Road. It has really no connection whatever with the Brighton Meeting, and ought not to be allowed to have any influence in regard to such events. The accident might just as well have happened in any other part of the country. Lest, however, the enemy find in it an occasion as usual to blaspheme, we would point out as forcibly as possible that the Automobile Club have discouraged the employment of racing cars at high speeds on ordinary roads, even for testing purposes, and have

1. The three cars in Event 3, Heat 1, on Wednesday, in line for the start. Mr. F. W. Wilkinson's 8-h.p. Stanley steamer (No. 29), Miss E. W. Madeley's 6½-h.p. Cadillac (No. 30), and Mr. M. McCraith's 12-h.p. Leader (No. 31).
2. Event 3, Heat 5, Mr. A. J. Dzw's 9-h.p. Speedwell (No. 41), Capt. W. H. Bennett's 7-9-h.p. Dixi (No. 42), and Mr. E. N. Greaves' 8-h.p. Rover (No. 43).
3. Event 3, Heat 5, Thursday, Mr. E. W. Lewis' 20-h.p. Rover, Mr. H. Gordon's 28-h.p. Wayne, and Mr. H. Carver's 16-h.p. Bridgwater.

BRIGHTON MOTOR MEETING.

BRIGHTON MOTOR MEETING.—Event 6, Heat 4, Thursday. 1. Mr. P. Martin and A. Horden starting on their 30-h.p. Daimlers. 2. Event 2, Heat 5, Mr. Hill on his 12-h.p. Darracq versus Mr. W. D. Fair on his 10-h.p. Cupelle.

passed the most drastic resolutions providing for offences of the kind. No club or association in the world, however powerful and representative, can prevent breaches of its regulations by anyone who is determined to break them.

As to the events themselves they were really very monotonous. Seldom was there a close finish, and only

when the racers passed was there any sense of speed. A match between two touring cars is very exciting when both nearly win, as the Irishman would say, but as witnessed in the Brighton events, the majority of such matches were hopeless *mesalliances*, and the succession of heats degenerated into a kind of disorganised procession.

BRIGHTON MOTOR MEETING.—Secretary Orde's observation tower on the course. In this tower, telephones were connected up to every point of the track, enabling Mr. Orde to keep in touch with all parts. The cars racing are Mr. Sydney Barrett's 18-28-h.p. Mercedes and Mr. D'Arcy Baker's 24-h.p. Fiat. In the corner of the picture we give a snap, by Mr. Frederic Coleman, of Mr. Orde in his conning tower, as seen from below. Mr. F. P. Armstrong and Mrs. Manville are also in this picture.

1. Event 4, Heat 4, Wednesday. Soon after the start (which point can be seen in the distance), Mr. H. O. Hall's 15-h.p. Darracq making the pace against Mr. H. E. Hall's 12-16-h.p. Talbot and Miss A. M. Hind's 18-28-h.p. Gnome.
2. Event 3, Heat 6, Thursday. Mr. Searight's 12-16-h.p. Decauville, a 20-h.p. Winton and Mr. Arnold's 12-14-h.p. Whitlock-Aster.
3. Miss Victoria Godwin on her Ariel Simplex, getting near to the finishing line.
4. Mr. Clifford Bowring winning his race for 15-h.p. White cars. This photograph is by Mr. Frederic Coleman.

BRIGHTON MOTOR MEETING.—THE CARS AT SPEED.

Car v. Cycle.

Perhaps the most interesting event of the whole meeting was the match between Cissac, on his 12-h.p. Peugeot bicycle, and J. E. Hutton, on his 120-h.p. Mercedes car, also a similar match between Rignold, whose machine was similar to Cissac's, and Lee Guinness, who drove his 100-h.p. Darracq.

The tests were held over a standing kilometre, in order to introduce the element of quick starting and acceleration as much as possible. Neither of the cycles got away very well at the start, and both were eventually losers, nevertheless Rignold established a new world's record for motor cycles in this event, and so also did Lee Guinness for racing cars.

There is a great deal in mere speed, and it is curious

1. Mr. A. D. Grigg's 28-h.p. Daimler and Mr. A. Bush's 28-h.p. Daimler.
2. Mr. H. O. Hall's 15-h.p. Darracq (No. 56) versus Mr. W. J. Wright's car of the same type in the final Heat,
Event No. 4, Wednesday.
3. Mr. Ramoisey's 24-h.p. Germain and Mr. Tom Thornycroft's 24-h.p. Thornycroft Car.

BRIGHTON MOTOR MEETING.—Some close finishes.

BRIGHTON MOTOR MEETING.—The Chief Constable, Mr. Gentle, was one of the most important factors contributing to the success of the meeting. To his whole-hearted co-operation, tact, and personal work, must be largely attributed the perfect carrying out of the general arrangements. Either riding or on foot, Mr. Gentle was ever on the alert, personally directing his fine body of men.

BRIGHTON MOTOR MEETING.—Racing Autocycles. Preparing for the final. Cissac and his 12-h.p. Peugeot (No. 5), Barnes and his 10-h.p. Barnes (No. 10).

that the sensation of anything unusual does not—even from the spectacular point of view—become apparent until these speeds are very great indeed. It was a sight worth seeing to witness Earp drive his six-cylinder Napier at over 97 m.p.h., for the machine travels unlike anything else on the road and, without disparagement to other racing cars, it may justly be termed the finest example of a racing car extant.

Had it not been that some derangement took place in the bevel-gear which drives the commutator, Earp would in all probability have been successful in the Flying Kilometer Event for the *Autocar* Challenge Cup. As

it was, however, the result lay between Guinness and Hutton, the former eventually proving the winner, all his times for each of the three tries being better than those of the 120-h.p. Mercedes, which did so well on the second day in the standing mile.

Later in the afternoon, Earp got his car going in good condition again, and essayed to lower the British Flying Kilometer record, which he had put up on Friday. In this he was unsuccessful, but he did actually make exactly the same time of 23 secs.

Racing Car Handicap.

One of the most interesting events was the handicap

BRIGHTON MOTOR MEETING.—Racing Cycles.

1. The start for the final. Cissac, 12-h.p. Peugeot (No. 5), Barnes, 10-h.p. Barnes (No. 10), Collier, 7-h.p. Matchless (No. 14).
2. Cissac crossing the line when making his new world's record.

BRIGHTON MOTOR MEETING.—The racers at the starting end. 1. Mr. Clifford Earp on his 6-cylinder Napier and Mr. Moore Brabazon (90-h.p. Mors) in line. 2. Mr. J. E. Hutton on his 120-h.p. Mercedes waiting for the word to start for the "Daily Mail" Cup. 3. The Mors and Sir Ralph Gore's Mercedes ready for the signal. 4. Miss Dorothy Levitt getting up pace on the 80-h.p. Napier for the "Daily Mail" Cup Race. 5. Mr. Earp on the way for the Flying Kilometre. 6. Mr. Lee Guinness on his 100-h.p. Darracq taking his turn in the "Daily Mail" event.

W. E. PRICE, Esq., 7, Pocklington Walk, Leicester, writes:—

21st June, 1905.

"I thought you would be interested to know of a run I had on the 6 h.p. car purchased from you at the end of March. On Saturday I left my house at Knighton, two miles from Leicester, at 20 minutes to six in the morning, and arrived at Horrabridge, 10 miles the other side of Plymouth, at a quarter to eight in the evening. I did not drive in any way recklessly, and had no trouble with the car whatever. The most surprising part of the performance is, in my opinion, that, whereas I started with $5\frac{1}{4}$ gallons of petrol, there was still a quarter of a gallon left when I reached Exeter, 196 miles from here. You will see that it works out at more than 39 miles per gallon. During my holidays I journeyed altogether over 800 miles without a single mishap or stop for mechanical troubles whatever."

Feet: Metres.—The range of this *Lineal Measurement Scale* is such as to render it useful in comparing English and French dimensions of wheel-base and track. Each division above the line represents 3 inches. Each division below the line represents 0.1 metre.

THE RACE FOR WHITE STEAM CARS

at BRIGHTON, JULY 21st, 1905,

was won by a

STANDARD 15 H.P. CAR

in the hands of a Private Owner, in 1 minute 31 seconds.

BRIGHTON MOTOR MEETING.—Miss Dorothy Levitt, on her 80-h.p. Napier, winning, in the Sweepstake Handicap for Racing Cars, against Mr. Moore Brabazon on his 90-h.p. Mors.

RESULTS IN RACING CAR SECTION.

* Distance covered was about 80 yards short of a mile.

† Winning times which secured the cups.

‡ Earp's time of 23 secs. for the flying kilometre constitutes a new English record.

Photo by Mr. Frederic Coleman.

BRIGHTON MOTOR MEETING.—The Hybrid Matches. Cycle v. racing car. Mr. J. E. Hutton on his 120-h.p. Mercedes v. Cissac, and Mr. Lee Guinness on his 100-h.p. Darracq v. Rignold.

for racing cars—an event rendered all the more popular by the victory of Miss D. Levitt on the 80-h.p. Napier. Both the heats in which Miss Levitt took part were decidedly the most interesting of this event, for in the first she beat Mr. Moore-Brabazon by four-fifths of a second, and, when running against Sir Ralph Gore, her car passed the line with $1\frac{3}{4}$ secs. to spare.

Much disappointment was felt at the non-appearance of Mr. Charles Jarrott with his De Dietrich racing car, and no one, it appears, was more disappointed over this than himself, for we hear from him that Messrs. De Dietrich and Co., having entered the car for the Circuit des Ardennes—together with the other two cars, which were entered for the Gordon-Bennett—found that time would not permit them to spare Duray's machine for Mr. Jarrott's use.

Mr. Victor Miller was another disappointed entrant for the racing section, his 100-h.p. Fiat—from which much was expected in view of the splendid performance of the Fiat cars on the Auvergne Circuit—not having arrived in England in time for the event. The 150-h.p. Dufaux driven by the Hon. C. S. Rolls was only completed on board the boat which brought it to England, and not unnaturally Mr. Rolls found it impossible to get it tuned up properly for the event.

Cissac and Rignold, on their racing motor cycles, were second only to Earp and Hutton in the interest which they aroused by their sensational performances, but, of the two, Cissac's manner of riding his machine was the more impressive. Both competitors used 12-h.p. Peugeot machines, but Cissac had actually the most powerful engine. These bicycles weighed only 110 lbs., and 40 per cent. of this was utilised in the engine. Frame and spokes were cut to the finest degree, so that any sudden swerve from the true course would inevitably buckle the whole machine, which is merely designed for sprint racing, and would, of course, be useless for an international circuit event. Cissac and Rignold were both delighted at having lowered the world's records, and the latter expressed confidence in being able to still further improve his time at Blackpool, after he has slightly altered the gearing of his machine, which is now about 2:1. Another 12-h.p. Peugeot was entered by an amateur rider, Mr. O. L. Bickford, but unfortunately the wheel collapsed during a trial spin over the course, and Mr. Bickford—who was happily unhurt—was unable to get a new wheel fitted in time for the event. The difficulty of getting such powerful machines under way without breaking the driving wheel is very great indeed, and Mr. Bickford's gear was, we understand, even higher than those of Cissac and Rignold, representing about 100 m.p.h. at normal engine speed.

An event in which ladies are actually the competitors is always an attraction, and the Ladies' Handicap on Friday afternoon proved no exception to the rule. All the ladies who took part are well known in the automobile world, especially Mrs. Herbert Lloyd, who won the event, and Mrs. Manville, who was second. In winning, Mrs. Lloyd secured a fan presented by the London, Brighton and South Coast Railway, while Mrs. Manville was awarded a Cup which had been presented by her successful rival competitor.

Considerable difficulty was naturally experienced in handicapping so many different cars as those entered for the other handicap events—more especially as some of them had not actually competed in the other races.

Among the touring cars, there was one very noticeable feature, namely, the extraordinary number of Daimler

cars and 15-h.p. Darracqs which were in evidence, but not only were they great in numbers but great in deeds also. It is quite true that there were not over many close finishes, but those which took place were well worth watching. The most startling finish of the whole meeting was undoubtedly the one made by a 15-h.p. White steam car in one of the heats on the first day. The White was actually behind until just before the finish, when suddenly, with a turn of the throttle-valve, the car shot forward and won the heat in "real sporting" style.

Another good race was that between Mr. F. F. Wellington, on a 20-h.p. Spyker, and Mr. Sharp, on a 20-h.p. Thornycroft, while in another heat of the same event Mr. Tom Thornycroft almost ran a dead heat with Mr. H. Ramoisy, who was driving Capt. Masui's 24-h.p. Germain. It is a curious coincidence, which has not passed remark, that these two well-known motorists are always being drawn against one another for first heats, and there is no question but that they always give the public an exciting finish, which is more worthy of a final than a mere heat.

The idea of having separate events for standard types of touring cars was popular, and it demonstrated how much difference may exist in similar cars when controlled by dissimilar drivers. On the first day, there was an event for 15-h.p. Darracq cars, and, in the first round, as much as 6 and 7 secs. divided the heat winners from their unsuccessful competitors. Two similar "standard car" events took place for 30 and 35-h.p. Daimler cars on the first and third days respectively, but it is difficult to dissociate these particular events from two others—unreserved—which took place on the second day, when out of 17 and 11 entries respectively, 5 and 8 of the cars entered in the two events were Daimlers. Some really close finishes were witnessed in these inter-Daimler events, and Mr. Anthony Horden is to be congratulated on the very close running which he made, first against Mr. J. M. Gorham and then against Mr. Percy Martin, only losing both events by a mere half length. In competition with Mr. G. M. C. Instone, Mr. J. M. Gorham was himself beaten by less than a second, and in the race between 35-h.p. Daimlers, Mrs. Manville won the semi-final against Mr. Chas. Hardy by only $\frac{2}{3}$ sec.

Among other lady drivers who took part in the racing were Miss A. M. Hind, who drives an 18-28-h.p. Gnome, and Miss Victoria Godwin, who made some excellent runs with the new 30-35-h.p. Ariel-Simplex, with which she only missed securing the cup, in the fourth and final round, by four-fifths of a second. Miss Dorothy Levitt was not in evidence in the touring class events, but her new rôle was admirably performed on the 80-h.p. Napier racer, on which her clever manipulation was a source of considerable admiration.

New Records.

Standing Kilometre (World's Record).

Lee Guinness... 100-h.p. Darracq ... 35 $\frac{1}{2}$ secs. = 62'48 m.p.h.

Flying Kilometre (British Record).

C. Earp ... 90-h.p. Napier (6-cyl.) 23 secs. = 97'25 m.p.h.

Flying Mile.

Rignold ... 12-h.p. Peugeot ... 46 $\frac{1}{2}$ secs. = 71'0 m.p.h.

Flying Kilometre.

Cissac ... 12-h.p. Peugeot ... 26 secs. = 85'98 m.p.h.

Standing Kilometre.

Rignold ... 12-h.p. Peugeot ... 36 $\frac{1}{2}$ secs. = 61'79 m.p.h.

THE 1905 DE DIETRICH CARS.—PART V.

The Change-Speed-Gear.

IN Figs. 18, 19, and 20, the change-speed-gear, and the manner in which the gear-box is fixed to the chassis, are very clearly shown. The box is made in two parts, the upper (M) of which has a large inspection-door, M¹, and the lower (M²) is secured to the cross-tubes, S¹. The casting, M², is only fixed rigidly to the one cross-tube when the upper casting, M, is tightened down upon

shafts—runs in ball-bearings, has four keys formed solid with it, for the spur-wheels to slide upon, and all the four wheels are secured together so as to move in unison. They are controlled in much the usual way, by an engaging fork which is fixed to the rod, M⁶, and this rod is connected to the sleeve, M⁷ (to which the gear-lever is fixed) by the rod, M⁷. The second-motion-shaft, N, has a hardened steel thrust block, N¹, at its front end, to take the thrust of its bevel-pinion, and there is a ball-thrust-bearing behind the large bevel-wheel on the differential countershaft. A special feature of the countershaft is that universal joints, N⁴, are introduced into both ends, so that no distortions of the main frame can have any detrimental effect on the differential-gear, N³, or on the gear-box.

The "reverse" gear consists of the two intermediate spur-wheels, N², which lie beneath the first-motion-shaft, N⁵, these wheels being brought into mesh with the "first-speed" wheels on the two main shafts by the sliding sleeve on the shaft, M⁵. The wheel on the first-motion-shaft comes into mesh with one of the intermediate wheels, N², when the gear-lever is moved into its neutral notch, and the effect of moving the lever into the "reverse" notch is to make the "fourth speed" wheel slide the other wheel, N², into gear with the large wheel on the shaft, N. A spring tends to press the wheels, N², rearwardly. The sprockets on the ends of the countershaft

are fitted in such a way that they can be quickly changed at any time.

The Brakes.

The foot-brake, which is operated by the pedal, P, acts upon the drum, P¹, that lies just outside the gear-box and is solid with the shell of the differential-gear. The brake-shoes, P², which are normally held apart by the two springs, P³, are forced up together, to grip the

Fig. 18.—View of the De Dietrich Change-Speed-Gear in place in the chassis. In this illustration, which shows the mechanism from above, the upper portion of the gear-box has been removed.

it, but it has a projecting lug, M³, which rests upon that tube and serves to support it when the gear-box is dismantled. At the front end, the two forgings, M⁴, are secured to the casting, M², and these in turn are bolted up from underneath to two brackets on the other cross-tube, S¹. This method of fixing not only renders it very easy to "line up" the gear properly in the chassis, but facilitates the removal of the mechanism, intact or in parts. The first-motion-shaft, M⁵, which—like the other

Fig. 19.—On the left is a view showing the rear portion of the gear-box in place, in the De Dietrich Chassis, with the foot-operated brake-band removed from the brake-drum on the counter-shaft. On the right, the differential countershaft is shown separately, and the brake-band is seen lying beneath it.

Fig. 20.—View (from above) of the front portion of the 24-h.p. De Dietrich Chassis, with the dashboard removed; showing the complete gear-box in place, and the compensating device for the hub-brakes alongside it.

The hub brakes, which are operated by the rock-shaft, Q , to which the hand lever is fixed, can be interconnected if desired with the main clutch by means of the rod, Q^1 . They are compensated in their action by means of the swinging link, Q^2 , the ends of which are coupled up with two independent rock-shafts that in turn are connected

Fig. 21.—Interior view of one of the expanding hub-brakes on the De Dietrich Chassis; the road wheel, together with its brake-drum and chain-wheel, has been taken off.

drum, by the rod, P^3 , and a very powerful toggle mechanism renders the brake extremely effective. No less than three adjustments are available for enabling any wear of the metal friction-faces to be taken up, though as a rule it is only necessary to tighten the nut, P^6 , for this purpose, an operation that can be done by hand without the use of any tool. The other adjustments are for properly centring the shoes about the drum, both when the brake is "off" and also when it is "on." The fulcrum-pin, P^4 , is turned eccentric for this purpose, and thus it is only necessary to partially rotate it about its axis before clamping it down between the caps, P^7 , and the forging that forms the lower portion of these clips. The other adjustment referred to consists of a set-screw (not visible), which is screwed into the under-side of the lower shoe, P^2 , and forms an adjustable stop for it.

Fig. 23.—View of the De Dietrich steering-gear, dismantled to show the internal construction.

Fig. 22.—The De Dietrich steering-gear, complete with its pillar and wheel.

with the brakes. The spring, Q^3 , is fitted between the compensating link, Q^2 , and the cross tube, S^1 , of the frame, and the two rock-shafts are supported at their ends by the brackets, Q^4 .

In Fig. 21, the construction of the brakes themselves is very clearly shown, and it is worthy of notice that although the internal parts are rendered dust proof, yet access can be obtained to them at any time by merely taking off the road wheel. The rod, Q^6 , is that which passes from the compensated rock-shaft already mentioned, and it is hinged to a lever arm that projects from the same shaft as that to which the cam, R^5 , is fixed.

The expanding brake-ring, R , is normally held up against the stationary circular guide, R^2 , by the four springs, R^3 , and it is prevented from rotating in either direction by the stop-block, R^1 . Connecting the two ends of the rings together are the toggle links, R^4 , which naturally cause the ring to expand when the cam, R^5 , presses against the pin to which both are hinged. The stationary guide, R^2 , not only serves for holding the ring clear of the brake-drum, but it also tends to prevent any excess of oil from finding its way from the axle on to the brake surfaces.

The Steering Gear.

Fig. 23 clearly demonstrates the construction of the steering gear, for in this illustration the two portions of the containing casing, T , have been taken apart, and the triple-threaded worm, T^1 , is shown with the nut, T^2 , only partly screwed over it. Beneath the worm, T^1 , is an adjustable ball-bearing, T^6 , by which all end play can be taken up, and, formed solid with the nut, T^2 , are a pair of toothed racks which mesh with the corresponding segments on either side of the lever-arm, T^3 . This lever-arm, together with its segments, is mounted upon an eccentric pin, T^4 , which not only forms a stationary bearing surface for it, but enables the segments to be brought properly into mesh with the toothed racks. The pin, T^4 , can itself be locked tightly to the casing, T^1 , in any required position, for there are a series of holes in the flange, T^5 , at its inner end, and the locking set-screw can pass through either of them. Owing to the fact that the lever-arm, T^3 , does not overhang, and that any back-lash can be taken up when required, this steering gear is of an unusual strong and durable character.

Table of Reference Letters for the 24-h.p. De Dietrich Car Illustrations.

A Petrol tank.	E ⁴ Lever-arm at base of steering pillar.	J ⁶ Engagement pins on the sliding rod.	N ² Intermediate wheels for reverse gear.
A ¹ Auxiliary tank on dash.	E ⁵ Timing lever.	J ⁷ Lever arms controlling throttle-valve.	N ³ Differential gear.

A Sussex Magistrate gives Sound Advice.—We have often observed that, with the extension of the automobile movement, magistrates would ultimately become automobilists, and prejudice would die out. We have already had occasion to draw attention to the very sensible remarks made by a member of the Guildford Bench on the subject of the unfair prosecution of motorists, and the vindictive convictions with which that Bench is specially associated. And now a Sussex magistrate—Mr. E. M. Crookshank, of East Grinstead—has stepped into the rostrum and made some very sensible observations on the general situation. In Mr. Crookshank's opinion the great motor car industry has come to stay, and with a large number of unemployed about the growth of the new industry is of the highest importance to the country. There is no limit, in his

opinion, to the possibilities of motor vehicles in dealing with agricultural produce and fruit. A great deal was said about going back to the land; but his view was that a great deal would also be learned about the true meaning of going back to the roads. Mr. Crookshank is in favour of the French method of restricting speed at corners, through villages, towns, and dangerous places, and letting people go as they like in the open country; but, as a motorist of experience, he recognises that children are the great terror of the motor car driver; and he thinks it would be a good plan if the teachers in elementary schools were to point out to children generally how dangerous it is to get in front of approaching cars, as they often do, and how difficult it is to estimate the speed at which they are approaching.

THE BARTON-RAWSON AIRSHIP.

Willing helpers hauling out the huge airship from its lair.

The airship half out of its shed. The helpers steadying the hull during the process of "trimming up."

BARTON-RAWSON AIRSHIP.

IT was with very keen interest that we journeyed to the Alexandra Palace on Saturday last to attend the first—and, as it has proved, the last—public performance of the Barton-Rawson airship, which, as everyone knows, has been under construction and completion for a very long time. The airship had gone up on the previous Wednesday, making a circuit of the Palace grounds (a sort of "*voyage autour de ma chambre*") and this experiment proved so satisfactory that it was determined to give the great construction a day, or, at any rate, afternoon, out on Saturday.

Since our last description of the Barton airship it has

undergone many modifications. Its general appearance remains the same, but the propellers have been reduced in size to 7 ft. in diameter, and their speed has been increased from 140 to 1,000 revs. per min. The clutches and gear-down between the 50-h.p. motors and the propellers have also been abandoned, and the motors now drive the propellers directly by belts. The aeroplanes, too, which were a feature of the original construction, have on account of weight also been practically abandoned. We say *practically*, since they have been replaced by comparatively insignificant constructions of canvas, which, considering the general size of the air-

BARTON-RAWSON AIRSHIP.—The airship, immediately after its release, clearing the trees while passing into the higher atmosphere.

BARTON-RAWSON AIRSHIP.—Ready for flight. Mr. Rawson is in his place on the right. Dr. Barton (with his son) is at his post to the left.

ship, could not be expected to produce much practical effect.

Originally—when described and illustrated by us on November 14th, 1903—there were three pairs of propellers, each propeller consisting of three 2-bladed fans 12 feet in diameter, and there were to be three motors of 50-h.p. each. The propellers were, moreover, driven at low-speed through 8 to 1 gearing, introduced between the crankshafts and the belt-driving pulleys. Later—when fully dealt with again in our columns on July 9th, 1904—the central motor with its two propellers had been abandoned, but it was only comparatively recently that the small high-speed propellers were substituted. Until lately, also, there were no less than 30 aeroplanes fitted between the deck and the top of the framework, these being arranged in three banks, each bank having two sets of five, mounted “venetian-blind fashion”; each aeroplane had an area of 45 square feet—a very different matter in comparison with the latest small affairs. Another device that was also abandoned, when remodelling the ship, was that for maintaining a level keel, by means of ballast tanks at each end, and a pump for displacing the water from one to the other. As will be remembered, the “hull” is made of bamboo, and its length is 127 feet. The balloon is 180 feet long by 40 feet in diameter, the capacity being about 200,000 cubic feet, and the total weight of the ship is about 14,000 lbs. ($6\frac{1}{4}$ tons); taking the lifting power of pure hydrogen in air as being .074 lbs. per cubic foot, the balloon would be capable of raising a weight of 14,800 lbs.

Among the other notable alterations should be included the modification in the name by which this British “Clipper of the Clouds” is now designated. Formerly it was the Barton airship. Now it is the “Barton-Rawson.”

There was a large attendance of spectators at the Alexandra Palace on Saturday, filling the special enclosures that had been arranged for them, and extending not only over the grounds of the

Palace itself but along all the roads and points of vantage in the neighbourhood, most of the available house roofs also being provided with interested contingents. The public appearance of the airship was preceded by a function held inside the shed which has formed its refuge for so long a period. The great gas vessel was of course fully inflated, but getting the airship out into the open was a service of no small difficulty. Strictly speaking, it was too big for the shed, and a trench had been cut in the ground to more or less effectually accommodate the keel. While being pulled outwards by the ropes, the bamboo framework of the hull suffered somewhat in consequence, and while being held steady by numerous enthusiastic spectators and assistants outside, there was a good deal of snapping among the fine cords by which the hull is suspended from the gas-vessel, owing probably to the abnormal strains set up by the oscillations which occurred between the gas-vessel itself and the hull, and by the flexibility of both.

We had an opportunity of inspecting the behaviour of the four new smaller propellers while examining the airship before the start was made. They form a departure in aeronautic propeller construction, being made entirely of light wood. When revolved at normal speed there was an unusually distinct difference between the suction produced on the front side and the draught induced on the opposite side. Apparently they drew in the air from over a very large area, and thus enabled it to find its way to them at a low velocity, whereas, on the other hand, the air was forced astern by them in a compact column that travelled at a fairly high rate of speed in consequence. One of our illustrations well shows their appearance and arrangement, besides enabling—when compared with the very complete set of views given by us formerly—the general nature of the recent modifications in construction to be realised.

Soon after the appointed hour, the great machine was led out of the shed and held by a regular army of

BARTON-RAWSON AIRSHIP.—The ship in its shed, showing one of the new propellers and one of the new shaped aeroplanes.

Dr. Barton, Mrs. and Miss Barton in the balloon shed before the ascent.

The balloon in full, free flight.

BARTON-RAWSON AIRSHIP.

assistants, mostly volunteers from among the spectators, and about an hour later she was let go, and soared immediately, and with a certain stateliness, to a considerable elevation. The car was occupied by Mr. Barton, who was on what may be called the main bridge forward (where he had the bow engine under his control), by Mr. F. L. Rawson, who was in command, by Mr. A. Gaudron, and by Mr. Henry Spencer, who manipulated the stern motor. As soon as the vessel commenced to rise, Dr. Barton started the forward motor, the two front propellers, of course, revolving with it, and subsequently Mr. Spencer succeeded in getting his machine in action. There was a distinct breeze blowing, about the force of which a good deal of difference of opinion has prevailed.

The airship started facing the wind, but, by the time she had reached an altitude of about 500 feet, it was evident that she could make no headway, or even hold her own, against it. She was then steered round, and ran before it for some little time, while still rising, before being brought round once more to fight against it. For a time she endeavoured to return to the starting-point, but it was evident that the wind was too much for her, and soon her pilot, abandoning the contest, allowed her gradually to swing round, and she drifted away towards the east, more or less broadside on, attempting to proceed across the wind, and in this manner ultimately disappeared from view.

At one time descending, but soon after rising in the air till an altitude of about 2,400 feet or thereabouts was reached, the airship gradually approached Romford, in Essex, where she was ultimately brought down with great success by M. Gaudron in a potato field near Heaton Grange. A garden party was in progress at the Grange, and the sudden descent of the airship upon the scene provided an unlooked for diversion for the guests, of which they were not slow to take advantage. The airship was quickly surrounded, and Dr. Barton, who

was in the bow, was immediately the centre of an admiring throng of ladies, who heartily and even enthusiastically showered upon him feminine congratulations on his plucky and adventurous achievement. And that was the cause of the trouble. Both Mr. Rawson and M. Gaudron were conscious that they too had bravely "adventured" as much as Dr. Barton, and forward they moved to join him at the bow and to share in the congratulations. The balance of the airship was upset. The rear portion began to rise up, and the gas tending to accumulate at the highest portion of the gas-vessel increased the mischief. In fact, the airship was proceeding to stand upon her head, and in this way to eject Dr. Barton and Messrs. Rawson and Gaudron into the centre of their admirers, Mr. Spencer alone being left in the stern, and in danger of soaring away with the liberated airship into the blue beyond. Without wasting an instant, Mr. Spencer, with great presence of mind, grasped the "ripping-gear," and tore up the gas-vessel, the hydrogen issuing from the rent balloon with a roar. Down came the airship, the gas-vessel, of course, completely wrecked, the frame a good deal damaged, but the motors alone escaping without injury. The adventurous experimenters ultimately extricated themselves from the *débris*, and were so much elated at finding themselves safe and sound that they hardly felt the destruction of their airship. In fact, it is satisfactory to learn that Dr. Barton did not intend using the airship further even had she completely escaped injury.

It is plain to everyone that the airship's power of propulsion was wholly inadequate to enable it to proceed against even a moderate breeze, and Dr. Barton himself admits that the ship was too large, and the rudder too small. Of course a good deal has probably been learned personally by the experimenters on questions of balance and stability, but it cannot be maintained that anything in the nature of a distinct step forward in the campaign for conquering the atmosphere has been accomplished.

BRITISH INTERNATIONAL CUP FOR MOTOR BOATS—ELIMINATING TRIALS.

THE first event of importance next week will be the Eliminating Race to determine who shall represent Great Britain in the British International Race for motor boats, to be held in Arcachon Bay, on September 11th. Last year these eliminating races preceded the race itself, which was held on the same day; but on this occasion, since France now holds the cup, it has been necessary to hold the trials separately, and the Motor Yacht Club—who now control all A.C.G.B.I. marine events—have incorporated this race into a

race is due to start at half-past twelve, so that those who intend to witness it will be able to cross over from Portsmouth to Ryde in the morning. From Ryde to Sea View is only about half an hour's walk, and there is also a motor bus service between the two places.

Five entries have been received for the race, viz. :—

Lieut. Mansfield Cumming's "Competitor," which is the old Napier Minor hull fitted with a Siddeley engine.

Lord Howard de Walden's "Napier," which is a feather-weight boat, the hull being constructed on the Saunders'

system (as is that of "Competitor"), the engine is of the standard Napier type, developing about 80-h.p. A description of this craft appeared in our issue of March 18th this year.

Mr. Lionel de Rothschild and Mr. John Scott-Montagu have entered "Napier II." in place of the special boat which is being constructed for them, but is not yet ready.

"Brooke I," which is entered by Mr. Mawdsley Brooke and Captain Corbet, had one of the six cylinders, which have a 10-inch bore and 8-inch stroke, damaged by a

broken valve during a trial run last Monday. We understand that the entrants have petitioned the club for a postponement of the event, failing which, for permission to meet the winner at a later date, and, if successful, to be entitled to be one of Great Britain's representatives.

The only other entrant is Mr. J. E. Hutton, with his "Hutton II.," which is another craft fitted with a six-cylinder engine, the bore and stroke being $7\frac{1}{4}$ ins. and $6\frac{1}{2}$ ins. respectively.

BRITISH INTERNATIONAL CUP.—Eliminating Trial Course.

regatta, to be held off Sea View on Tuesday next, August 1st.

Three other events are down on the programme for the same day, viz., a cruiser handicap and two racer classes, one for boats below 25 ft. and the other for boats between 25 and 30 ft. in length. Up to the time of going to press, we have not heard that these events are likely to prove extremely exciting, but as they are not even yet closed it is possible that a goodly number may actually turn up at the start. The actual eliminating

INTERNATIONAL CUP FOR MOTOR BOATS.—America has entered for this cup, presented by Sir Alfred Harmsworth, which this year will be run off at Arcachon on September 11th. The boat shown above is Mr. E. R. Thomas's Dixie, of New York, which is one of the boats entered on behalf of America to compete.

ARE YOU HAVING . . .

TYRE TROUBLES?

IN THE CEYLON RELIABILITY TRIALS

A Car driven by a Lady, fitted on all four wheels with High-Speed

SIRDAR-BUFFER TYRES

won the first prize in the Official Reliability Trials, proving once more that they are most comfortable, reliable, and economical.

LET US QUOTE FOR CONVERTING YOUR WHEELS TO THEM.

Thousands of delighted users can be referred to, who can tell you they are as comfortable as pneumatics, and the only reliable tyres.

Extract from "THE AUTOCAR," July 15th.

A NON-NIPPING AIR TUBE.

"I see in last week's *Autocar* (p. 56) a drawing of the Sirdar Non-Nipping Tube. To those who have not tried this tube, I would like to say that I have one which I keep as a spare for single-handed replacement. It is the most delightfully easy tube to put in as it lies right up in the concavity of the cover well out of the way of the security bolts and the beaded edges. No air is put into it till the cover is on the rim and bolted down."

MOTOR "ACCIDENTS."

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—In view of the numerous accidents to motor cars, more especially in recent months, the following may be of interest to your many readers:—

It will doubtless be within your recollection that a serious accident befel a party of motorists, travelling in a second-hand, recently acquired, car from Dartford, with the intention of reaching Deal. On descending a steep hill on approaching Strood, an accident occurred resulting in the overturning of the car, and the passengers being severely injured, one of them, the owner (not driving), dying on the way to the hospital. It was reported at the time that the accident was caused by the bursting of one of the rear tyres. Having had considerable experience on the causes of motor accidents, I considered I would be performing a duty to the public, and to automobilists in particular, if I went down and investigated the cause of the accident. With the least possible delay I proceeded to Strood, and on arrival was shown the car, garaged in a farmyard adjacent to the scene of the accident. On investigation, the car (which was at least 10 years old, and incapable of doing more than 15 miles on the level) proved to be a complete wreck, so far as the body was concerned. The off-side rear tyre was completely detached, and being of solid rubber naturally could not have burst, the near-side tyre was half out of the rim. The near-side chain was also broken, a distinct flaw showing half-way through one of the links, which were of the old block type, the driving sprockets on each side being considerably out of alignment. Chain guards were also fitted around the small sprockets. My theory of the accident, the feasibility of which will doubtless appeal to your expert readers, is that in descending the hill the car was allowed to overrun the engine, and in so doing attained an unusual speed, the chains being out of line and considerably worn, one of them mounted the small sprocket, and, getting entangled in the chain guard, locked the differential on that side, thus doubling the speed of the opposite side, causing the car to swerve, the front of the car coming into violent contact with the rather high kerb of the pavement, stood on its head, so to speak, and turned on its side, the steering-wheel striking a lamp-post there, and the passengers were thrown out, with the result as stated.

Hearing that the inquest was to be held that day, I decided to attend and volunteer evidence, if necessary. The inquest stood adjourned, and my services were not taken advantage of that day; other evidence was given which, to my mind, was not in accordance with the facts, and my object in writing this letter is to call attention to the importance of these accidents being officially investigated, as is done in the case of railway accidents, and we should then hear less of motor accidents. This particular car ought not to have been on the road, seeing the condition in which it must have been handed to the purchaser. Had it been expertly inspected beforehand, the accident could not possibly have happened.

Trusting that the importance of the subject will be a sufficient excuse for taking up your valuable space, and thanking you in anticipation.

Yours faithfully,

D. DOYLE.

9, Charing Cross Road. July 19th.

THE CLUB AND THE AGITATION.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—On Thursday, the 13th inst., I ventured to address the following letter to the Automobile Club. The matter to which it refers is of such general interest that possibly you may consider it worthy of publication or notice:—

"May I be permitted to humbly offer suggestions as to work which might be carried out by the club, in view of the public agitation against motor cars, and the fact that the law controlling motor cars is to be reconsidered by Parliament next year?"

"Those who have thought of the matter know that the roads and not the cars are at fault, that no legislation can prevent our roads from being far more used than they are at present by motor cars, and that the dust nuisance must increase unless roads are made of material suitable for the new and improved methods of travelling."

"I therefore beg to suggest that the club should, without further delay, re-make a stretch of road near London, where the dust is particularly aggravating at the present time. I do not suggest the

use of Westrumite, or tar, on existing road surfaces, as these can only be regarded as temporary expedients, but that the road should be re-made from its foundation with Tarmac, and other similar road material, and that when this has been done a general invitation should be issued by the club to the whole of the County Councillors of England and Wales, and especially to the Surveyors and Highways Committee to attend:—

"1. A demonstration on this piece of road with a view to proving that roads can be built so that motor cars are no longer a nuisance by reason of dust.

"2. A conference at which there should be placed before the County Councillors and surveyors, by the club, figures regarding the cost of relaying roads with the new material, the cost of their up-keep, and at which discussion should be invited as to how this cost is to be borne.

"Such a Conference should form a commencement of an educational campaign with a view to the nationalisation of the roads, and their re-making throughout the Kingdom with suitable material. The Conference should be followed by efforts to secure that in every county at least one stretch of road—and that, if possible, the stretch which is most used, and in which, at the present time, dust causes aggravation to the greatest number—should be re-made with the new material, so that it might be proved conclusively throughout the length and breadth of the land, that the dust nuisance is a temporary nuisance, and that the roads must be re-made.

"Such a campaign, if energetically undertaken by the club, would tend to accelerate what may otherwise take very many years, namely, the nationalisation and entire re-making of the roads of this Kingdom, and at the same time might remove some of the prejudice which exists against motor cars.

"In the interests of the movement, I venture to hope the Motor Union will avoid having club runs in various parts of the Kingdom during dusty weather. The head of an anti-motor movement, who wished to excite popular indignation against motors generally, would, I believe, organise a series of runs in various parts of the Kingdom, such as are now being organised by the Motor Union, in which car after car in rapid succession passes through a district, each car creating a huge cloud of dust, the long procession of cars as a whole making the road almost impassable for other users. Surely such demonstrations as these are particularly unwise in view of the very heated feeling throughout the country against motor cars. I took part in one, but resolved never to take part in another.

"Whether it be or be not suicidal, in the light of public opinion, to hold or permit at the present time meetings at which touring cars are exhibited travelling at 60 miles an hour, has been too often discussed to make it necessary for me to do more than express the hope that the club committee will again give this matter careful consideration before holding or permitting any further speed trials after that to be held at Blackpool."

Yours faithfully,

CLAUDE JOHNSON.

APROPPOS of the "discrimination" displayed so regu- larly by the notorious Guildford Bench, it is of interest to record that on Saturday last a motor car driver was fined £20 for exceeding the speed limit, while a blackguardly horse driver, who was working an unfortunate mare, lame in both legs and certified by the veterinary surgeon to be totally unfit for work, was only fined £1 and 10s. 6d. costs. The "lovers" of the horse invariably do their utmost to get the last ounce out of him.

MISS ANNESLEY KENEALY, who is so well known in the automobile world, arranged last week, with the help of a number of other car owners, to take out a small army of cripple children from the east of London for a motor car run. Altogether 100 children were loaded up on fourteen cars, about 200 others being conveyed in brakes, and the excursion to Loughton and Shaftsbury Hall and back again, was a most hilarious one. Miss Annesley Kenealy's idea was from every point of view a happy one. It has given the children an enjoyable day's outing and has demonstrated to all the villages on the line of route that motor car owners are far from being the child-destroying monsters that they are sometimes represented to be.

THE TOURIST TROPHY.— PART III.

To guard against "Freaks."

ALTHOUGH, naturally enough, the question of "freaks" has already arisen frequently in this article, there are still certain aspects of it which call for review, and should apparently be provided against in the rules. It is true that certain conceivable forms of freak cars are automatically guarded against in the restrictions that have been advocated above, but there are certain others which might not only be built to comply with those rules, but might also actually win the race. Perhaps the most probable directions in which the spirit of the rules could be successfully evaded would be in the employment of single-cylinder engines of unreasonable size, and of gear-boxes having an abnormal number of "speeds." In these two respects, therefore, it would, we think, be wise to frame special rules arbitrarily prohibiting them. The type of touring car which it is, now at least, most desired to develop always has at least two cylinders, and never has more than four forward speeds, and therefore nothing but good could result from precluding all vehicles having only one cylinder, or having more than four speeds. How much further it may be found advisable to go in respect of the number of cylinders, is a matter largely of opinion, and is one upon which the experience gained in this year's race is sure to be most valuable.

Apart from such specific cases as those just dealt with, it is so essential for all obvious "freaks" to be excluded from the Tourist Trophy, that we consider a rule should be made by which the organising officials can refuse to accept them as entries. It would, of course, be understood that the rule was not directed against any commercially useful new development, but merely to prevent clever evasions.

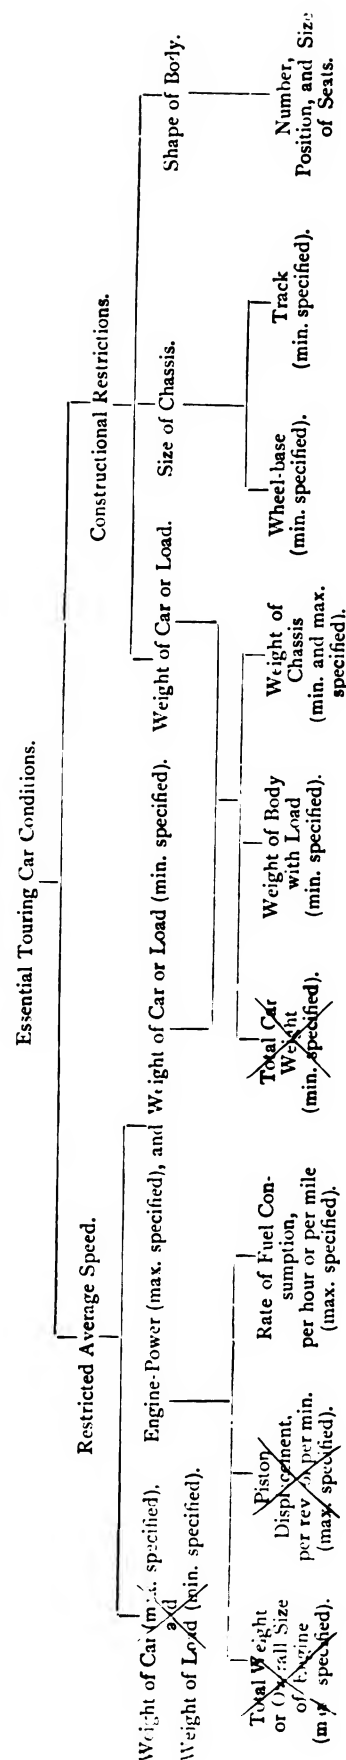

Some Further Suggestions.

There are one or two further ways in which we think the event could be rendered either more attractive or more useful to the general public than it otherwise would be. The first of these suggests itself because it is obviously impossible for all the cars to be started simultaneously, and yet is highly desirable that the spectators at every part of the route should know from their numbers the relative time allowances between the different cars. All that it is necessary to do, in order to secure this result, is to start the cars in the order of their numbers, and to allow some constant and well-understood interval of time to elapse between each start. There appears to be no reason why the cars should be delayed compulsorily at any point on the route, although it doubtless would be wise to make them come to rest for an instant at each "control," and, therefore, any spectator would—without having to make a complicated calculation—know the true relative positions of the cars at any time. Possibly, this idea might advantageously be carried even further, and a second number plate be used to indicate the number of laps that had been completed. Certain it is, at any rate, that too much cannot be done to retain the full interest of the public in the race as a spectacle of a highly interesting kind.

Our next suggestion is that the A.C.G.B.I. officials who conduct the trials should subsequently issue a full analytical report, not only expressing personal opinions

Graphic summary of the conclusions arrived at in our article; showing the various possible methods of eliminating, from the Tourist Trophy Race, all but bona fide touring cars, and indicating which suggested means have been discarded.

Read in the same way as a genealogical tree, each point leads on to the next natural consideration of possible or alternative methods of achieving the desired end. Each succeeding line—reading downwards—may therefore be regarded—in relationship to the previous line—as indicating "how to do it," as compared with "what has to be done."

concerning the merits or demerits of any special devices, but also giving as much useful data of a general character as possible. It should, too, enable comparisons to be made between the slower cars which completed the whole distance, and those which just failed to do so through lack of fuel, for it would thus do much to remove any possible injustice that might be done on this score to any firm through a misunderstanding on the part of the public. In any case, everyone would be anxious to know how much petrol each successful car had in reserve at the end of the race.

There is yet one more point to which attention might well be given in connection with the Tourist Trophy in future years, and that is as to whether it would not be wise to enlarge the scope of the event, and to develop two distinct types of car, instead of only one. By merely altering all the specified weights, dimensions and fuel allowances, any particular kind of car could be encouraged, so that it would be easy to institute a second class for two-seaters capable of averaging a speed of, say, 20 miles per hour. For the smaller class, there would, of course, be no need to exclude those having single-cylinder engines, but, on the other hand, the number of "speeds" in the gear-box might be limited to three. It would probably be out of the question to run the smaller cars over the same route at the same time as the larger cars, but we think a "motor week" would be most attractive to the public, and that the two events might be allowed to run consecutively. Three days for the larger, and two days for the smaller cars would doubtless meet the case.

Summary and Conclusion.

For convenience of reference we have summarised, in tabular form, the various suggestions contained above, and have also prepared a complete list of the weights, measures, and dimensions already specified by the existing rules. Concerning the former, we strongly advocate the adoption of all, with the exception of No. 10, which is open to question; and with regard to the latter, we would point out that, apparently, "E" and "F" require revision now, while "A" and "C" will doubtless have to be modified frequently as time goes on, in order to make them conform to the best practice of the day.

From what has been said, we think it will be agreed by all that the general basis upon which the Tourist Trophy rules have been framed is such as to render that event vastly more popular, and considerably more useful to the buying public, than any other form of competition that has been held previously. We have not only endeavoured to explain the difficulties that are essentially encountered by those who attempt to frame satisfactory rules for any automobile event, but have also tried to suggest methods whereby the desired results can be most nearly obtained, without risk of doing any injustice, or causing undue expense, to the manufacturers of the competing cars. For our own part, we feel that it is only necessary for purchasers and makers alike to realise what the value of this event might be to themselves, and the success of the Tourist Trophy Race is ensured. The event has, at any rate, the great advantage of being purely "made in England," and—being essentially practical—is typically British. We may be a "nation of shopkeepers," but even if we are, we are buyers as well as sellers, and we not only like to think that the best we sell is made in our own country, but we like to know that what we buy is the best.

Suggested Modifications of Rules.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

Specified Weights, Measures, and Dimensions.

- (A) *Fuel Consumption*—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

VIEWS AND OPINIONS OF OUR READERS.

IN placing the numerous communications that we have received with regard to our article on the Tourist Trophy before our readers, we would take this opportunity of thanking the writers of these public contributions on the subject, and of also extending our most cordial thanks to those who, from one reason or another, do not feel free to publish their personal opinions, but have, nevertheless, written assuring us of their support, and explaining the causes for the natural reticence that they experience in the matter, at the moment. It has come as an agreeable surprise to us that so many of our readers, including most of the leading men associated with the industry, should have expressed their appreciation of our article, and it is particularly encouraging to see that the subject of the Tourist Trophy race is receiving the widespread attention that it deserves. There is no doubt that the question, when dealt with in the only way that it can be at the present time—in the abstract—is difficult and intricate, but it is to be hoped that the strong light which is thus being thrown upon it, from all and every point of view, may materially assist in its solution, and may lead to the establishment of a really satisfactory type of automobile contest, that is not only of a sufficiently simple character to appeal to everyone, but will constitute a true test of all the most desirable attributes of a perfect touring car, and will place a proper value on skilful driving.

The Hon. Arthur Stanley, M.P., Chairman of the Automobile Club:—

I beg to acknowledge with thanks the receipt of your letter of the 13th instant, enclosing copy of the able and interesting article which appeared in your Journal on the subject of the Tourist Trophy Race. I think it is an admirable statement of the objects for which this race was instituted, and it shows clearly the benefits that are likely

to arise from it. I am certainly of opinion that an annual contest such as this will be of real use to purchasers of motor cars, will be beneficial to the industry, and will prove to be a popular event.

Hon. C. S. Rolls:—

I think your remarks and suggestions concerning the Tourist Trophy and its value to the buying public are very excellent.

Racing, pure and simple, has served its purpose, and the construction of special racing machines, which are of no use to the ordinary motorist, involves competing firms in enormous expense.

I have always been in favour of a limitation other than weight, and am personally in favour of limited cylinder capacity. Limitation of fuel, however, will have much the same effect. Whichever may be the best method of limiting the speed and power of competing cars, there is no doubt that the Tourist Trophy may be said to be the first race for motor cars run on rational lines, the object of which is the improvement of motor cars of a type which is useful to the ordinary purchaser, instead of encouraging the breed of more or less freak machines.

For this reason, it is to be hoped that the Tourist Trophy, with certain modifications in its rules, which experience may show to be necessary, will become a great annual National event.

Chas. S. Rolls

Mr. G. H. Baillie:—

Your articles on the Tourist Trophy constitute, I believe, the first full discussion which has been published on this race and its novel restrictions, and what you say well serves to show how much more interesting and intricate a problem the contest is than an ordinary fuel consumption trial. What you do not say, though, and have, I hope, reserved for future issues, would show this even more forcibly.

You have touched really one side of the question only, viz., the other means of limiting speed to the one adopted, and the various other restrictions required to make the race useful as a tourist car evolver. But you have not raised the question as to how far the main limitation of fuel will achieve its object of restricting speed, nor have you discussed to any extent the consequences of this limitation in engine and car, if the contest between makers becomes keen enough to induce them to experiment. A consideration of these questions brings one to many points in the working of petrol engines, about which one has to plead ignorance. Here I think the Tourist Trophy may be of great service; the competition offers to makers of cars a commercial inducement, and, at the same time, an inducement to carry out experimental work which cannot fail to benefit the industry.

I cannot now recall any figures giving the variation of fuel consumption of a petrol engine with speed. Measurements on gas engines are always made at nearly constant speed and variable power, and, as might be expected from engines with a comparatively low mechanical efficiency, show that maximum efficiency is obtained at full load. In a petrol engine maximum power is reached at or slightly under normal speed, but it is probable that maximum efficiency will be obtained at a lower speed. The lower the speed, the less throttling there will be in the inlet passages, and the greater will be the compression. High compression leads to high efficiency, but there will be, I think, an early limit to the increase of efficiency with diminishing speed, on account of the greater interchange of heat between cylinder walls and gases at lower speeds. The speed for maximum efficiency will be below the normal speed, but probably not very far below it. This, though, will depend on the engine; the more restricted the inlet passages, the lower will be the speed of maximum efficiency.

This is an important point, as on it chiefly depends the success of the fuel restriction in limiting speed. The wind and road resistance, of course, comes in, but at speeds up to, say 40 miles per hour, the wind resistance is not high, and the road resistance does not increase rapidly with speed.

The ordinary touring car is so geared as to run on the level on top gear and at nearly full speed, with the throttle partially closed. This is an uneconomical condition of running, and there is no doubt that the majority of touring cars could be run more economically on top gear by increasing the gear. For touring purposes such an increase of gear would sacrifice comfort in running by requiring a too frequent change of gear, but for racing it would tend to defeat the aim of the promoters of limiting the speed.

I notice that throughout your articles you speak of *average* speed, but surely what it is intended to restrict is the *maximum* speed. A touring car that will average 25 miles per hour with upper and lower limits of 30 and 20 miles per hour, is far better than one making the same average with limits of 40 and 10. What is wanted, and what is, I believe, the object of the Tourist Trophy, is to restrict the

maximum speed and let the best average win. I fear the full limitation will not achieve this object, and I incline to the view that the car running between 40 and 10 miles per hour will consume less fuel than the one running between 30 and 20, because the engine will be running longer at full load and moderate speed.

Where the fuel limitation is likely to lead to results of the greatest interest and importance is in carburettors and methods of regulation. In stationary gas engines it has been found that the greatest economy is obtained by using mixtures as weak as possible, and there is no reason to suppose that the same is not the case in petrol engines. The present day practice in regulation is not, however, to use weak mixtures, but to diminish the quantity of mixture when running at lower loads. Regularity of carburation is not a strong feature; too many variables—temperature, pressure, quality of petrol, &c., affect it. Consequently, under all conditions of running, there must be a margin to allow variation of mixture without going outside the limits of expossibility. From the correct mixture the margin in the direction of richness is much greater than that in the direction of poverty of mixture. So, to secure certainty of firing, the mixtures now used are usually too rich. The nose is generally able to confirm this. There is no doubt this is the right condition, for regularity in firing is more important than economy in petrol. But if carburation could be made more regular, petrol could be economised without sacrificing certainty of ignition. The best regulation for the Tourist Trophy would probably be one that gave the correct mixture at full load and weaker mixtures at lower loads; anyhow it would have the advantage of minimising the trail of smell.

The little suggestions with which you conclude your articles are worth consideration by the organisers of the race. The cut-up body is an ingenious idea, but I doubt its utility except to prevent chassis freaks. The ordinary car chassis, even if too light for its work, will give way, not after hundreds but after thousands of miles, and I do not quite agree with you that the body has much effect in strengthening it; the points of attachment of the body are usually too few, and the attachments themselves too light for the body to have much effect on the chassis.

The second suggestion I thoroughly agree with. The last reliability trials showed that petrol consumption increased largely with the number of cylinders, and there is no doubt that the larger the cylinders the more efficient is the engine. Four-cylinder engines are adopted for the sake of quiet running and absence of vibration, and it is a fault in the Tourist Trophy conditions if a premium be placed on one and two-cylinder engines. It is, though, a difficult point to meet, without having separate races for one, two, and four-cylinder cars. The four-cylinder car ought to be encouraged for the sake of those who can afford it, and the one and two-cylinder ought equally to be encouraged for the sake of those who cannot.

No. 3 is undoubtedly right; a five-speed car would be almost a freak.

Nos. 4 and 5 are good for everyone but the club officials.

I feel doubtful if much would be gained by extending the race. A three days' race now-a-days is too short to test what a car can stand, and a one-day race is long enough to test what it can do.

Nos. 7 and 8 would certainly serve to increase public interest.

In regard to No. 8, I think there should be as little stopping and as few controls as safety allows.

No. 10 I do not agree with. A private car is generally driven by one man who knows how to get the best out of it, and the best a car can do is what one wants to test, and what is tested when the car is driven by the man with most experience of the particular type.

I ought, before concluding, to apologise for the greater part of this letter being irrelevant to your articles. If, though, you were thereby stimulated to write further articles on the subject of my irrelevance, the apology would be needless, and the Tourist Trophy would be bearing fruit while yet, so to speak, in the womb.

G. H. Baillie

Mr. Claude Johnson:—

Having interested myself for many years in the possibility of arranging for a race of motor cars of moderate speeds, which would tend to improve the touring car, rather than create a car which is quite unsuitable except for racing at very high speeds, I am delighted to read the advance-proof of the articles on the Tourist Trophy Race, which you have been good enough to forward to me prior to their publication in your valuable journal.

The special commission, on which I had the honour to serve, which prepared the rules for the Tourist Trophy Race, expressly stated that they did not for one moment think that they had arrived

at the best conditions for the race, but that these could only be arrived at by experience.

The rules which control yacht racing were not framed by a body of men sitting round a table prior to the commencement of yacht racing in its present form, but are the results of years of experience. I believe that experience will enable us to arrive at far more satisfactory conditions for the Tourist Trophy Race than those compiled by the Commission.

With reference to the suggested modification of rules:—

1. Without dividing the body into four independent parts, it might be stipulated that the ballast should be carried on a floor which is born by the chassis, and not by the framework of the body.

2. and 3. I agree that the engines should not have less than two cylinders and the cars should not have more than four forward speeds.

4. The rejection of "freaks" is a difficult question. It is human to err, and the authorities might reject a car (which might eventually prove a distinct advance on anything hitherto designed) because it differed radically in design from standard cars. My impression is that the "freaks" should be allowed to run, and that if their qualities are such that the public would not buy them as touring cars, the makers would not gain much by their manufacture, and other makers would suffer little from being beaten by a car which nobody would buy. If, on the other hand, the "freak" is a car which the public would like to drive, it is right that it should be permitted to run.

5. The disqualification of a car for being noisy must again depend on human judgment. If a jury of the public, consisting of not less than twelve men, could be placed in a jury box during the race to measure how long before the arrival of a car opposite their box they could first hear its approach, some sort of standard might be arrived at, but I should not like to see the disqualification of a car placed in the hands of one or two men.

6. If, for instance, the Isle of Man authorities would permit the race to extend for two or three days, I should strongly be in favour of its extension.

7. Presumably the race will be started in the manner suggested.

8. The control stoppages should, if possible, be organised as you suggest. As regards the numbers on the cars (instead of being 1, 2, 3, 4, 5 consecutively), they might correspond with the number of minutes at which the car is started at the beginning of the race after the departure of the first car. Supposing that the intervals are 3 mins., the first car would be No. 0, the second No. 3, the third No. 6, the fourth No. 9, and so on, so that the spectators might see at a glance that the last-named car had started 9 mins. after the first-named.

9. I would suggest that the identification numbers should be carried on the front and back of the cars, and on each side of the cars there should be a case in which large cards could be slipped indicating the time in minutes occupied by the car from the beginning of the race up to the completion of the last round completed—the figures of the first round to be black, the second round blue, the third round red, and the fourth round white on black. These figures could be slipped in on the completion of each round, and the spectators would know at a glance precisely how many minutes each car had occupied from the time that it started, and therefore the relative positions of the cars irrespective of their actual order on the road, and this without any calculation whatever on the part of the spectators.

10. The suggestion is admirable, and I think, workable. There would be no difficulty in providing a different driver for each day.

11. I think it would be a mistake to have on the road at the same time cars averaging 25 miles an hour and cars averaging 20 miles an hour. This would mean that the slow cars would be

New Identification Mark.—For the County Borough of Northampton, the Local Government Board have allotted new identification letters, viz., N. H. This new mark takes effect from July 14th, but does not interfere with the validity of the identification letters of any car registered with the Council before that date.

ACTING upon official instructions, the Scarborough Chief Constable has stopped motor cars from going on to the Esplanade during Church parade. A correspondent writes and asks under what authority the police claim to take these arbitrary proceedings. We should like to know that too.

being passed all day by the faster cars, and the difficulties in passing might delay certain cars, and thus destroy the accuracy of the record, and at the same time would increase the danger of the race.

Possibly we may have fixed the chassis weight a little too light and the body weight a little too heavy, but these appear to be errors in the right direction.

Featherweight bodies are as a rule neither comfortable nor durable, and the cutting down of weight in the chassis within reasonable limits is desirable.

Personally, as a member of the trade, I am very grateful to the AUTOMOTOR for the spirited manner in which they have taken up this matter, and for the very valuable article they have contributed towards the solution of what is undoubtedly a very important, and at the same time, a very difficult problem.

Claude Johnson

We have since received the following further communication which Mr. Claude Johnson has sent out:—

If one places oneself in imagination in the place of a spectator watching the Tourist Trophy Race next September, sitting on a wall at some spot remote from a control, one can realise how difficult it will be for him to know which of the fifty or sixty cars is leading. If the cars are started at two minutes' interval, the last car may start nearly two hours after the first car. The race, therefore, to the spectator is likely to be nothing more or less than a procession of cars. I have ventured, therefore, to suggest in a letter to the Editor of THE AUTOMOTOR JOURNAL, that such a circuit race might be made more interesting if each car bore on its sides large figures denoting the number of minutes which have elapsed between the start of the car and the conclusion of the circuit it had last completed. The figures on the cars should vary in colour with each circuit. By this means the relative position of the cars would be graphically demonstrated to the spectator, who would readily know, for instance, that although a car might pass him an hour and three-quarters after the passing of the first car during the 3rd circuit, it had occupied 240 minutes in completing the first two circuits, whereas the first car had occupied 245 minutes. The difficulties of organisation do not appear to me to be great, and I beg to make the following suggestions:—

1. Each car should have fitted to its sides frames in which figures printed on stiff cards could be dropped at the end of each circuit.

2. Control keepers should, of course, note the time of the arrival of a car at a control and the time of its departure, but instead of entering this on a card and forwarding it to the chief control in the box attached to the car, he should be supplied with metal discs of various sizes, large one representing a minute, the others to represent half minutes, quarter minutes, and five seconds, and should drop these into the box attached to the car, discs to a number representing the exact time from the arrival of the car at control until its departure.

3. At the end of a circuit, the time-keeper, by a simple subtraction sum could ascertain the gross time occupied by the car from the commencement of the circuit to its finish. His assistant, by counting the discs found in the box at the end of the circuit, could quickly ascertain the number of minutes occupied in controls, and by deducting these from the gross time, the nett time for the circuit would be arrived at, and the nett time in minutes occupied from the start to the completion of the circuit could be announced and recorded by the insertion of cardboard figures in the frames on each side of the car.

MR. EDMUND E. BENTALL has been gazetted Lieutenant of the Motor Volunteer Corps, and Capt. and Hon. Maj. Hercules, Oxfordshire L.I., Captain.

At a meeting on Saturday last of the Oxford Corporation Tramways and Highways Committee, instructions were given to Mr. Worby Beaumont and to Mr. Stephen Sellon to advise the Council as to the most suitable form of traction for Oxford, the Corporation having agreed to purchase the existing horse tramways under the tramways Act of 1870. Mr. Beaumont will advise on the subject generally, and with special reference to motor omnibus transit, and Mr. Sellon more particularly with regard to tramway traction.

SIDDELEY-MEYAN RELIABILITY CONTEST.

SIDDELEY-MEYAN CONTEST.—The cars descending to Aix-les-Bains.

THIS sporting match, it will be remembered, began on the 12th instant, when Mr. Meyan's 24-h.p. De Dietrich and Mr. Siddeley's 18-h.p. Siddeley started from Paris for their long run round France, and each week we have recorded the progress of the cars.

The competitors have now completed more than half their labours, and so far neither of the adversaries has lost a point. From all accounts the passengers have fared worse than the cars; nor is this surprising when one remembers the long distances to be covered at high speeds every day, the early starts, the dust and terrific heat that has been experienced throughout.

Save that both cars lost their way in a fog soon after leaving Boulogne, the first 1,000 kiloms., occupying the first three days, was accomplished practically without incident, and the cars arrived at Vesoul soon after midday on the 14th instant, where the competitors entertained each other at luncheon. The Siddeley averaged over 35 kiloms., or 22 miles per hour over the whole of this distance (running time), including the climb over the Plombières Ridge, while the higher powered De Dietrich exceeded this slightly. Both competitors drove at high speed when possible, Mr. Meyan frequently going over 70 kiloms. per hour, while the Siddeley maintained 60 for long stretches.

On Sunday, both cars left soon after 5 a.m. for Aix-les-Bains, through Besançon and Bourg, a distance of 330 kiloms. The Siddeley had a good deal of trouble with the near back tyre, which eventually had to be replaced, but both cars reached Aix in good time, the De Dietrich at 1 o'clock, and the Siddeley at 3.32. The day's run had taken them through some of the finest scenery in France, but the Dauphinais hills between Bourg and Aix were very rough on brakes and

tyres, giving the competitors a taste of what was before them on the next day's run. Our illustration shows the cars descending into Aix.

At 4.30 on Monday morning, the competitors left Aix by the Modane road to tackle the Mont Cenis pass on their way to Embrun, a distance of 287 kiloms., including a climb of 6,000 feet. The road rises all the way from Aix, but the gradient does not become stiff till after passing Modane, whence the road winds, with hairpin corners, up to the hut.

The Dietrich, as was to be expected, beat the Siddeley up by some 11 minutes, but both cars made the ascent ahead of their time, though with their cooling water boiling furiously. The descent to Embrun was made at break-neck speed, as owing to a misunderstanding both cars fancied themselves behind their schedule. Arriving at Embrun, where they slept, it was supposed that the worst of the trip was over; but, as a matter of fact, the next day's run to St. Raphael, 337 kiloms., climbing the Col D'Allos, proved even more trying than the previous day's experiences, the road being very steep and rough, the heat still excessive, while many of the corners forced the cars to reverse in order to get round. On this climb the Siddeley made a remarkable performance, doing 21 kiloms., with a total ascent of 2,200 metres in 59 minutes, and this with four passengers and a considerable amount of baggage on board. It would be difficult to conceive a more arduous trial for any car than these two days' work, and it is a matter of sincere congratulation to the makers that nothing but quite minor troubles occurred. Mr. Graham White in a letter to Mr. Siddeley remarks: "No written words of mine can give you an idea of the tremendous drubbing the car has been through during the last two days."

It should be borne in mind that both the cars have seen much hard service previously, and are by no means new, the Siddeley having been run over 40,000 miles, and Mr. Meyan's car, having had over a year's hard use, and has run some 30,000 miles.

On the 18th and 19th inst., the journey was continued to Bezières (337 kiloms.) and Luchon, in the Pyrenees (286 kiloms.), passing through flat and uninteresting country, nothing more trying was encountered than bad roads, punctures, and terrific heat.

At Luchon a day's rest was decreed, and it was decided, at Mr. Meyan's request, to cut out the run to Bayonne, and to go direct to Bordeaux.

On the previous day, the Siddeley had suffered considerably from overheating owing to some of the small tubes of the radiator being choked with dirt. An opportunity was taken here to clean out the radiator with a powerful hose, and no further trouble was afterwards experienced. Two covers were also replaced, and Mr. Meyan, as a matter of precaution, renewed all his tyres and replaced his valve springs.

Subsequent telegrams show that Brest, only 800 kiloms. from Paris, was reached without mishap.

If, as we hope, the British car goes through without the loss of a mark, Mr. Siddeley will deserve and receive universal congratulations. For whether his car dead heats with, or is victorious over, Mr. Meyan's De Dietrich, he will have shown that the British Automobile of to-day can hold its own in any company and under the most trying conditions.

At the moment of going to Press, we learn by telegram that the match has resulted in a dead-heat.

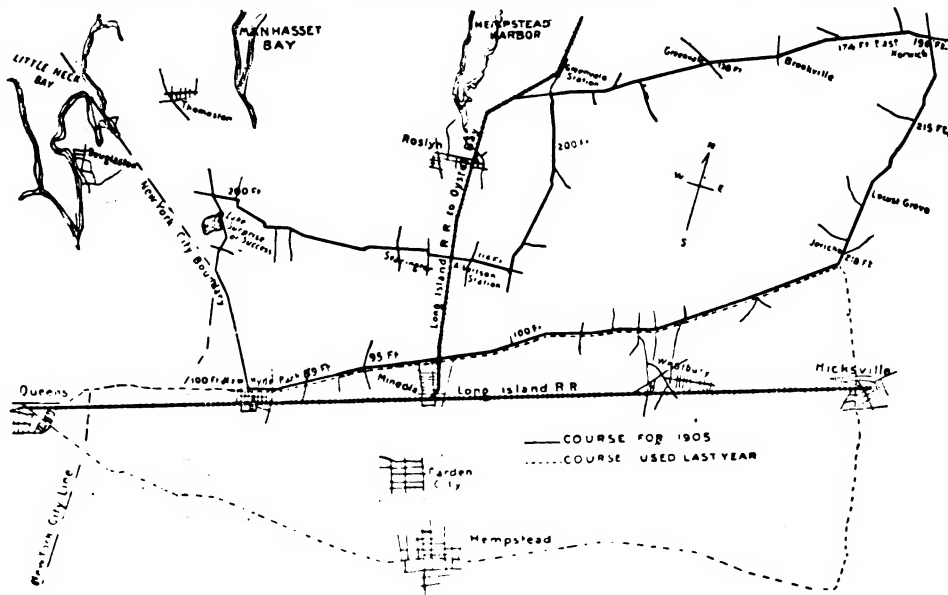

RACES, RECORDS, AND TRIALS.

The above drawing is the work of Mr. F. C. Wheeler, a Birmingham enthusiast on speed, he having allowed his imagination to run riot over visions of the Siddeley car built by the Wolseley Motor Car Company.

Vanderbilt Cup.—We gave the points of the new course for this cup the week before last, and we now publish a sketch map. A question has arisen in France in regard to France taking part, as the race is practically identical in principle with the Gordon-Bennett Cup Race, of which France has so recently entirely washed her hands. The suggestion is that here is France upholding and taking part in a similar race, which, in the event of a French car securing the cup, will place the A.C.F. in the position of having to import a new Gordon-Bennett event in to France from America, in which France again will only be entitled to equal representation with other countries. It is this principle which has brought about all the trouble over the Gordon-Bennett Race, and, therefore, it is held that to be consistent France should take no part in the Vanderbilt Race. The situation becomes, therefore, extremely interesting. In the meantime the A.C.F. have protested against the length of the new circuit—22 miles—and the folly of starting 35 racing cars over such a short course, which will mean the cars passing and re-passing each other at such frequent intervals as to seriously add to the

dangers of the race. The French club suggest that they may follow up their objection by scratching their entries—which, after all, would be an easy solution to the main question which has been raised.

THE Electric Vehicle Contest, which was being organised by the A. C. de France for August, has been abandoned, owing to the lack of entries received.

VANDERBILT CUP.—Outline map showing the new course for this Cup, particulars of which we gave the week before last. The American Eliminating Trial will take place on September 23rd, and permission has been granted for the running of the race on October 14th. The grand stand will probably be located at a point near Mineola. Our sketch map is from the "Automobile."

Mr. Victor H. Miller and Mr. D'Arcy R. Baker on the first of the new 60-h.p. Fiat Cars which arrived in England last week. The chassis, which is intended for touring, is designed on the same lines as the 24-h.p. model, with the exception of the clutch, which is of the Mercedes type, but has a double scroll. We give a view of the engine below.

Blackpool Race Meeting.—The programme for the Blackpool meeting was of a diverse character, although restricted to high powered cars in racing trim. Three events were down for the first day, and four for the second, six of the seven being scratch races. The racing cars competed over the flying mile on Thursday, and over the flying kilometre on Friday. The other Thursday events were standing start races over about a mile and a half, while Friday was reserved for the Flying Kilometre and the Lancashire Handicap, the latter being open only to members of Lancashire Automobile Clubs. A full report will appear in our next issue.

Welbeck Speed Races.—On June 24th we gave particulars of these speed trials held under the auspices of the Notts A.C. The results of the Scratch Events and Speed Judging we gave on July 1st, and it is now officially announced that the Wilson Cup, under the Handicap formula for the best performance over the flying kilometre, is secured by Mr. R. M. Wright, of Lincoln, who drove an 8-h.p. Wolseley.

WE are glad to note that upon the suggestion of Mr. S. F. Edge, it has been resolved by the Automobile Club that the whole system of classification in relation to race meetings is to be considered by the committee in conjunction with recommendations from the Races Committee.

Gordon-Bennett Race, 1906.—Italy does not intend to let the Gordon-Bennett Cup remain with France unchallenged. A formal challenge has been sent in and Mr.

Gordon-Bennett has been notified of the fact. The Italian Club's action is hardly to be wondered at in view of the splendid running of the Fiat cars on the Auvergne Circuit. In addition it is practically certain that an eliminating race for Italy will be necessary, as besides the Fiat cars in all probability there will be other candidates to represent Italy, including the makers of the Itala car (Turin), and at Milan the Züst and Isotta Fraschini. In France, M. Darracq—one of few—is very emphatic in regard to running in 1906 if he gets the chance, he strongly feeling that France should not retire from so important a contest.

View of the 60-h.p. Fiat engine from the inlet-valve side. The general design is the same as the 24-h.p. model, but the bore and stroke are 145 mm. and 160 mm., respectively.

August 5th and 7th, were the two G.-B. Wolseley cars, the three Gordon-Bennett Fiat racers to be driven by Lancia, Nazzari, and Cagno respectively, and a 100-h.p. Itala car with Fabry as driver.

Havre Speed Events.—The speed races over the standing mile and flying kilometre, arranged by *L'Auto* for August 3rd, between Havre and Harfleur, in connection with the big commercial vehicle reliability trial, will comprise three categories, viz, for racing cars, tourist cars, and heavy vehicles. These will be divided as follows:—

Racers.—Four classes—Motor bicycles, voiturettes, light cars, and heavy cars, according to the A.C.F. regulations.

Tourist Cars.—Seven classes, according to chassis price, from 4,000 to over 25,000 francs.

Heavy Vehicles.—Awards decided by formula—

$$\text{Load carried} \times (\text{Average speed})^2 \\ \text{Price of chassis.}$$

In each class the results will be governed by the combined times of the flying kilometre and the standing mile. The entrance fee is 20 francs per vehicle.

MOTOR CYCLING.

World's Championship for Motor Bicycles (Antwerp).—This race, for machines up to 50 kilogs., over 5 kilometres distance, was concluded on Monday last at the Zurenborg Velodrome, Antwerp, and was won easily in the final by Anzani, for Italy—against Olieslaeger (France), who burst a tyre, and Bac (France), who broke a chain and fractured his right foot. In the heats, the best time was 3 mins. 3 secs. for the 5 kiloms., flying start.

THE Auto-Cycle Club's Annual Race Meeting is now announced to take place on Saturday, September 2nd, at the Crystal Palace, when, amongst other trophies, THE AUTOMOTOR JOURNAL Cup will be competed for.

Silent Chains.—Those who are interested in high speed transmission of power by chains will do well to secure Messrs. Hans Renold's latest catalogue of their well-known "Silent" chains. The previous catalogue of this well-known firm bears the date of 1899, and several improvements in their chains have been introduced since that date. The present catalogue also contains a description of the principles on which their silent chains are constructed.

HERKOMER CUP.—We are able to reproduce a photograph of this important trophy presented by Professor Herkomer which will be competed for at the beginning of next month. The Trophy is of silver, and without the plinth is about 20 inches in length, and 2 feet high. It weighs 40 kilogs., and depicts the Goddess Victory seated on the apex of a cloud of dust with Mercury (personifying the commercial aspects of the movement) beside her.

Scheveningen Meeting.—An interesting series of events made up an attractive programme for this week's meeting, concluding on Saturday last. In the opening speed event over the standing kilometre, Wagner, on his 80-h.p. Darracq, tied with Jochems, on his 80-h.p. Mercedes, with 40½s., and in the re-running Wagner made best time in 37½s. against Jochem's 40½s. A novel and amusing contest was the slow race for mechanics over 500 metres, which was secured by Otto, on a C.G.V., in 7m. 52s., against Wanderwey, on a Germain, 7m., and Joubert (Renault) in 6m. 10¼s. A 100 metres backwards race for mechanics was won by Paaus (80-h.p. Mercedes), 13½s.

Glidden Cup.—In the climb, during this event, up Mount Washington, the Napier did the 8 miles rise in 20m. 8s., beating all records by 4½m. The best previous time has been made by Mr. H. L. Harkness, in 24m. 37½s.

Circuit des Ardennes.—Amongst the entries for this fixture, taking place on

One of the latest 15-20-h.p. 4-cylinder Brooke cars, on which Messrs. Brooke and Co. have added a small Cape cart hood for the back portion, and have included a new type "Brooke" dashboard, giving a pleasing finish to the design of the entire car.

CLUBS AND ASSOCIATIONS.

Motor Union.—The Union now includes 54 clubs with an aggregate membership of 7,070, in addition to 1,112 members who have joined individually, making a total membership of 8,182. The annual subscription is one guinea, but half the subscription at the present time will carry up till December next.

Society of Motor Manufacturers and Traders.

—The first ballot for spaces at the Olympia Exhibition in November took place on Monday last, the plans of the Exhibition having at last received the approval of the London County Council. The Society have completed a contract with the owners of Olympia, whereby the use of that building for motor exhibitions is assured to the Society for a long term.

£150 has been voted by the Society in support of the trials, races, &c., to be held this season by the Motor Yacht Club and the British Motor Boat Club.

Somerset A.C.—At the annual meeting of the club held at Haygrass House, Pitminster, at which Mr. Stanley Austin presided, a satisfactory report was presented, the membership standing at 91. Sir Wroth Lethbridge was elected president, with Sir Cuthbert Slade and Messrs. John Hargreaves, J. J. Jackson-Barstow, and R. A. Sanders, vice-presidents. The following were chosen as the committee:—Col. Barrett, Messrs. Stanley Austin (Glastonbury), W. S. Donne (Castle Cary), J. Aspinall (Bridgwater), R. B. Graves - Knyfton (Uphill), H. C. Batten, Vaughan Jenkins (Monkton Combe), Dr. Benson (Bath), H. L. T. Blake (Stogursey), H. Hippisley (Stoneaston), Chester Master (Bridgwater), and P. F. Cary Elwes (Somerton). Mr. A. Armitage was re-elected hon. secretary and treasurer.

Peugeot Cars.—Messrs. Friswell, Ltd., have issued a catalogue, which is an artistic production giving illustrations of all the latest types of Peugeot motor vehicles. The baby Peugeot has undergone considerable modification, but the price remains unaltered for this popular little car.

Capt. Duff, of the Life Guards, and Lady Julia Duff on their 18-h.p. Napier carriage.

MOTOR BOATING.

Paris-to-the-Sea.—On Saturday last this annual event organised by *Le Journal de l'Automobile* was started from Paris. A large number of entries had been announced in each of the series, but the whole affair resulted in a fiasco, as only three boats in all turned up at the starting point, viz., Mimi, Richochet, and Gardner-Serpollet. The organisers, however, insisted upon the contest being proceeded with, and these craft were accordingly sent off. The first stage was to Meulan. Richochet before this point simply disappeared, whilst Gardner-Serpollet returned to Paris, abandoning further participation under the circumstances, leaving Mimi to cover the whole course by herself. This little 8-h.p. *extra réglementaire* craft was formally escorted on its way with the exclusive services of three timekeepers, a committee, several journalists, and four motor cars, she covering the distance to Meulan in 9h. 57m. 10s., the little boat continuing its journey down to Havre in solitary state.

On Sunday a procession of cruisers started from Paris, in a run arranged by the *Yachting Gazette*, in connection with the Coupe de Trouville, organised by *Les Sports*. A very poor showing for this also resulted, although a few extra craft joined the procession from various points. The result was that for the Coupe Dubonnet, held at Mantes, under the auspices of the Helice Club, only one boat materialised, viz., Antoinette III., which indulged in a "walk over" the necessary 100 kiloms., her time being for the distance 2h. 20m. 32s.

Already a number of automobiles are in constant use in the Malay States, the commercial side of automobilism particularly commending itself to the residents in this country. An interesting photograph of a De Dion Bouton vehicle is shown above. This has been running over a considerable period and has been the means of greatly helping to spread the movement in this direction. This lorry is fitted with the De Dion expanding clutch type of gear.

POINTS OF LAW.

Liability for Chauffeurs.—A case which should prove very interesting to employers of chauffeurs was heard on the 17th inst. at the Westminster County Court. It appeared that one of Mr. E. H. Lancaster's drivers was instructed to take a customer for a trial run on a 12-16-h.p. Clément one Sunday morning. His services were dispensed with at 1.30, after which he was instructed to return to Leicester Street from Maida Vale, where the customer resided. Contrary to these definite instructions he took a party of friends for a ride on the car, and when near Bromley allowed one of the other occupants of the car to take the wheel, which resulted in a collision with a trap being driven from the opposite direction. The pony was so severely injured that it had to be killed, and some considerable damage was done to the trap. The owner of the trap brought an action against Mr. Lancaster, claiming £47 for damages sustained. The chief question was whether Mr. Lancaster was liable for his driver's actions, when the said driver was acting contrary to definite instructions. It was clearly proved by the evidence that the man was certainly acting without authority, and the judge held that in view of this fact no responsibility could be placed upon the employer. The result was a verdict in Mr. Lancaster's favour, with costs on the higher scale.

COMMERCIAL POINTS.

MESSRS. LANGDOWN AND CO., importers and indentors, of Christchurch, New Zealand, write to the secretary of the British Empire Motor Trades Alliance as follows:—"We note with much pleasure in the automobile papers that your Alliance has been formed for the furtherance of the sale of motors and motor accessories of all-British manufacture. This has especial interest for us in the face of the *new preferential tariff now in force*. We would be glad if you would hand our name to the members of your Alliance and get them to forward us catalogues, together with best prices f.o.b. for cash in London. We should like separate quotations for chassis and cars complete of from 5 to 16-h.p., also chassis suitable for delivery vans and omnibuses." Any replies should be sent to Messrs. Langdown and Co. direct.

THE Midland Railway Company's Thornycroft 'bus, of which we gave two views last week, has all four wheels shod with "Sirdar" solid rubber tyres, Mrs. Forsythe's winning Wolseley car, in Class III. in the Ceylon Non-Stop Motor Run, also has all tyres of the same make; while Lieut. Skelton's 12-h.p. Wolseley has these "high-speed" "Sirdar-buffer" tyres on the rear wheels.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

7298. 6th April, 1905. Improvements in or relating to Driving Mechanism for Motor Vehicles or the like. Rollin H. White 56, Hillburn Avenue, Cleveland, Ohio, U.S.A. Date under International Convention, 7th April, 1904. This is an improvement in that kind of automobile mechanism employed to transmit motion differentially from a longitudinally arranged driving-shaft to the axle sections, which are connected to the driving-wheels. It is the combination of change-speed gearing, differential gearing and clutch mechanism. There are four figures. Fig. 1 is a central sectional plan view, and Fig. 2 is a vertical sectional side elevation. A is the casing in which the whole of the gear is enclosed and mounted. The casing is formed of the parts a, a^1 , which are separable in a vertical plane at right angles to the axis of the axle section, in which plane the axis of the driving-shaft lies. These casing sections have flange-like lugs, a^2 , through which pass the bolts by which the casings are secured together. Two laterally-extended tubes, B, B¹, having flanges, b, b^1 , at their ends are secured to the casing sections. The axle sections, D, D¹, extend through the tube, B, to the casing, and they are rotated at differential speeds by gearing of ordinary construction. The axle sections pass through the drums, C, and have at their inner ends the bevel gears, d, d^1 , meshing with planet bevels, H. The axle sections are supported in ball bearings, the cups, F, F¹, having adjusting rings, J, J¹. The cones, k, k^1 , are the outer ends of the sleeves, K, which fit into the hubs, c, c^1 , of the differential drum. The

gear, c, c^1 , is formed on the outer edge of the head, c^1 . The driving shaft, M, extends into the casing through an opening in the front part, a^4 , and is provided with two cones, m, m^1 , and two cups, N, N¹, to form ball bearings for the shaft. The gear, G, has three sets of gear teeth, the level teeth, g , meshing with the bevel gear, c , the internal gear teeth, g^1 , and the external gear teeth, g^2 . On the shaft, M, is a sleeve, Q, on which is a gear, q , meshing with the internal gear, g^1 . This sleeve slides lengthwise on the shaft, and rotates therewith. When this gear meshes with the teeth, g^1 , it clutches the gear, G, and the driving-shaft together. The shaft, P, is parallel with the driving-shaft; it has a sleeve, R, slidably mounted thereon, and it carries two gears, r, r^1 , of different diameters, one of which meshes with g , and the other with the external gear teeth, g^2 , on the gear, G. The sleeve, R, has an annular groove, r^2 , which receives the pin, r^1 , passed through a rocking lever, T. The lever, T, is secured to the shaft, t , whose outer end carries the arm, r^2 , by which it may be rocked. The sleeve, R, has a groove, r^2 , which receives a pin, r^1 . The sleeve, Q, has an annular groove, q^1 , and this receives a pin, q^1 , attached to the opposite arm of the rocking lever, T. By this lever the two sleeves are caused to move in opposite directions. July 6th, 1905.

201. 4th January, 1905. Variable Speed Gearing. Thomas L. Sturtevant and Thomas J. Sturtevant, both of Harrison Square, Boston, U.S.A. In the present mechanism the low-speed train of gearing is directly connected with the driving part, without

elevation, partly in section, of this mechanism; 12 denotes a portion of a motor or power-shaft having a flange, 13, bolted to a similar flange, 14, on the hub of a fly-wheel or casing, 15, having a rigidly-attached cover-plate, 16, secured to or integral with which is an exteriorly-squared sleeve. 17. On the sleeve, 17, is mounted a gear-wheel, 18, provided with a grooved sleeve, 19, adapted to slide endwise on the sleeve, 17 (which is loose on the shaft, 26), to permit the gear-wheel, 18, to be engaged with either of the gears, 20 or 21, fast on or connected with the driven-shaft, 22, which may be directly utilised for driving an automobile, boat or for other purposes, or may be provided with a pulley, 23, for transmitting power for any desired purpose. The gears, 20 and 21, are connected with the shaft, 22, by a ratchet or grip device, comprising spring-pressed friction grip rollers, 24, interposed between a hub fast on the shaft and a ring gear, 20 or 21, the ratchet or grip devices being reversely arranged in the two gear-wheels, so that one may be utilised for the forward drive of the motor or power-shaft, 12, and the other for the reverse motion, the sliding gear-wheel, 18, being shifted by a shifting arm, 33, for the forward or reverse drive, and these ratchet devices being adapted to permit the low-speed gear-wheels or gear-rings, 20 and 21, to overrun, and thus be non-operative when the high-speed clutch device is in operation. Pinned to the high-speed shaft, 26, is a clutch disc or plate, 27, with which co-operates, for the high-speed drive, a second clutch-disc or plate, 28, having shoulders engaged by shoulders on centrifugal weight, 29, pivotally mounted within the casing, 15, held in their inner or inoperative positions by springs, 30, interposed between parts of the disc and the casing, 16, of the flywheel to which the plate, 28, is fastened. When the speed of the motor is sufficient to cause the centrifugal weights, 29, to swing outward to overcome the springs, 30, the clutch-disc, 28, will be forced into frictional engagement with the clutch-disc fast on the shaft, 26, and thus the rotary movement of the motor or power-shaft and of the flywheel, 15, will be imparted to the shaft, 26, through the friction clutch discs, and the motion of the shaft, 26, will be transmitted to the driven shaft, 22, through the high-speed gears, 31 and 32, fast on the shafts, 26 and 22, respectively. Thus the changes from high-speed to low-speed and *vice versa* of the driven part or shaft will be automatically and smoothly effected in that the clutch-discs enclosed within the flywheel casing may run in oil, so that there may be more or less slip when the changes take place. July 6th, 1905.

[Weekly. Price 3d.
Post Free, 34d.]

Lake Lucerne, where the big Motor Boat Meeting is announced to take place on August 19, 20, 21. It is hoped that a number of British motor boat enthusiasts will take the opportunity of visiting this magnificent spot, where everything that can conduce to the best use of a motor boat, is present. Mr. James C. Percy, so well known in the automobile world, recently wrote upon this subject as follows:—"Sitting on the banks of Lucerne watching the motor boats pass to and fro, all over the lake, suggests to my mind the great future that lies ahead of this phase of the motor industry. When I was in Switzerland eight years ago, there was no such thing as a motor boat on any of the lakes. To-day they are as common as blackberries in autumn. Of all the craft on the lake, the motor boats are the prettiest. Like a celebrated cocoa, 'they are best and go farthest.' I came across one the other day that had made a complete tour of the waters from Lucerne to Fluelen in time that put the big lake steamers to shame. Most of the motor boats here are privately owned. They are fitted up luxuriously with awnings—usually red—and, when cutting through the waters, present a perfect picture of grace, speed, and elegance. From what I can gather, the pastime is only in its infancy, and great developments are expected in this form of navigation during the next few years. Not only are the motor boats used here for pleasure, but several are brought into service for commercial purposes."

THE AUTOMOTOR JOURNAL.

PASSING EVENTS.

A Counter Move Needed.

TWELVE members of the House of Commons—six supporters of the Government and six members of the Opposition—who “hold strong views regarding motor cars” (one can form a vivid mental image of these gentlemen), are sending round circulars to the local Councils calling attention to the fact that the Motor Car Act will expire next year, setting forth the desirability of giving local authorities power to (as it is humourously expressed) “regulate the traffic” without the *interference* of the Local Government Board, and further advocating the bestowal of increased powers on magistrates for punishing motorists, particularly enabling them to imprison without the option of a fine. The precious circular ends up with the statement that complaints in town and country are every day increasing. The local authorities circularised are requested to reply to any of the following members of Parliament:—

Sir James Fergusson,	Mr. Rowland Barran,
Mr. Ernest Gardner,	Mr. Frederick Cawley,
Lt.-Gen. J. W. Laurie, C.B.,	Mr. F. A. Channing,
Col. C. Wyndham Murray,	Mr. Geo. Lambert,
C.B.,	Mr. E. J. Soares,
Sir Frederick Carne Rasch,	and
Mr. Brooke Robinson,	Mr. J. Cathcart Wason.

Sooner or later we shall see a general election, and we trust that all motorists will treasure the names of the twelve in vivid recollection of their propaganda. Every automobilist who places a car at the disposal for polling purposes of any one of them who seeks re-election, will be simply a traitor to the automobile cause. We would go further, and say that very special efforts ought to be made by automobilists, and particularly the Automobile Club and Motor Union, to place a splendid phalanx of automobiles at the service of whoever may happen to be opposing them. As the politics of the self-constituted board of twelve are equally divided, this will make no difference to the political situation, and the most enthusiastic partisan of either party may without hesitation adopt the line we suggest. We trust that it will be acted upon, and we shall cherish the names of the twelve members till the election approaches, and at that eventful date we shall remind our readers of the anti-motorist campaign these gentlemen have inaugurated, and repeat the suggestion which we now make.

A Shocking Example.

As a general rule we refrain from recording or commenting on the practically daily examples of flagrant injustice and contempt for the first principles of evidence, of which motorists are so regularly the victims in our police courts. It is only when an abnormally flagrant case of monstrous injustice comes before our notice that we deal with such episodes at all. Our readers will remember some of the shocking examples with which we have dealt in the past. We refer to the police trap through which every car that passed, from a modern 40-h.p. Mercedes to an ancient Daimler of the year 1896, all developed exactly 30 miles an hour, and to the case of the constable who admitted in evidence that he held up both arms as high as he could to stop the approaching car and at the *same moment* carefully took the time on his 30-shilling stop watch. These things have excited many a smile, and often

enough we have laughed over them in the hope that a day would soon dawn when such travesties of justice would be things of the past. All the nasty qualities, however, of mankind seem to be endowed with preternatural vitality, and if there is one place more than another where they flourish in unpleasant perfection, it is in the fertile soil provided by the contents of the crania of the magistrates who sit in the police court at Maidenhead. Mr. H. J. Tennant, M.P. for Berwickshire, was recently driving along the Bath Road an 18-h.p. Panhard, which was geared particularly low to enable it to tackle the Berwickshire hills. When approaching the police trap, to which he fell a victim, he was warned by another automobilist, and carefully timed himself over the 5½ miles ending in the police trap, and found that his speed only amounted to 17 miles an hour. However, the police trap was out to make a “bag,” and charged him on the strength of two constables and two cheap Swiss-made watches—which, it was shown in court, suffered from the usual defect that the holder could stop the second hand and let it go on again without its instantly returning to zero, a vital fault, which has caused them to be rejected by the Cyclists Union. The policemen of the trap swore to a speed of 30 miles an hour, and in spite of the fact that Mr. Tennant’s own evidence was corroborated by himself, by his driver, by Mrs. Tennant, and by Mr. Fowler, the other motorist who was travelling along the road behind him, the Bench believed the Swiss-made watches and constables, and fined Mr. Tennant £5 and costs.

Thus is the Road-Hog Manufactured.

It is thus that the development of the “road-hog” has been helped. The Automobile Club, the Motor Union, the automobile press, and a sensible section of the general press of the country, every rational motorist, and every single individual who has the interests of the automobile movement at heart, have for years past been doing their utmost to suppress the reckless driver and improve him out of existence. And all the time the Maidenhead and other Benches of magistrates are doing their utmost to manufacture him in large quantities. For that is what such cynical contempt for justice and the principles of evidence actually effect. It is what always happens when justice is tainted at its source. A premium is put upon law-breaking. “What,” thinks the careful considerate motorist, “is the use of my being careful and considerate when, if by any chance I drive into a police trap, whether I am proceeding at 17 or 70 miles an hour, I shall in any case be fined?” That, no doubt, is what many Benches of magistrates do, and we fear many of them will continue to act thus as long as the fines which they inflict go to the relief of the local rates. But it is a preposterous situation, that while all the best influences in the country are directed towards eliminating the reckless driver, Benches of magistrates and country policemen should in this way be putting a premium on recklessness.

A Much-Needed Measure.

WE have to thank the courtesy of the Roads Improvement Association for the draft of the Bill which has been drawn up by the Association, and which was introduced into the House of Commons last week by the Hon. Arthur Stanley. The general scope of the Association’s Bill is probably familiar to most of our readers, and it is designed to secure a number of alterations of a not

merely important, but essential character, if the movement "back to our roads," which has been the result of automobile development, should not be doomed to ultimate failure, from the breakdown of our present chaotic system of roads management. The essential features of the Bill are to provide for the following objects:—

- (1) To create a central department for the purpose of assisting the local highway authorities;
- (2) To increase largely the highway powers of the county authorities;
- (3) To provide for the construction of new main-roads through and out of the large urban districts;
- (4) To protect the interests of the ratepayers by providing that suburban districts shall be laid out according to some definite plan under which new trunk roads of adequate width shall be built and the existing ones widened before building operations commence, and so render unnecessary costly street-widening and improvement schemes, and
- (5) To amend the law relating to the maintenance of bridges.

These various points have been brought forward by the Association on previous occasions, and we have accorded the whole of them hearty support. It is unnecessary to point out any further their high importance, and we accordingly confine ourselves to the hope that this excellent Bill may ultimately find its place on the Statute Book, though it must be admitted that the prospects of any such useful measure being passed into law under existing Parliamentary conditions are far from hopeful. Of one thing, however, the promoters may doubtless feel assured, and that is the solid support of all the automobile Members of the House of Commons.

The Tourist Trophy a Subject for Amateurs.

THE majority of our readers—private car owners or prospective car owners—will doubtless have realised that a number of complicated questions are involved in the *abstract* consideration of rules for an event like the Tourist Trophy. And perhaps there may be some of them who will accordingly jump to the conclusion that the Tourist Trophy and its rules are one of those exalted and elaborate mysteries which only the expert can understand, and of which even the practical results will fail to appeal to the ordinary car owner. It would, however, be a great pity that such a mistaken idea should become at all prevalent. The amateur will perhaps be wise to abandon abstract considerations as far as possible, for a time at least, and acquaint himself instead with the results which follow from the application of the principles by actual trial with his own car. He will find the subject an interesting and fascinating one, which will very possibly cause him to learn more about motor car driving than he has known previously. Let him run his car over level roads, over undulating roads, and then in hilly country, proceeding at different speeds on each trial, and each time carefully measure his fuel consumption. He will be quite astonished at the extent to which he will find that skill and care in driving can get improved results from the same fuel consumption, and he will perhaps be almost more surprised to find how greatly the fuel consumption increases when reasonable speeds are exceeded. There is one respect, for instance, in which Trials of the kind cannot fail to be of general benefit. There are quite a number of amateurs who have failed to master the art of "timing" the ignition properly. This error in driving is not only responsible for waste of fuel and unpleasant phenomena due to the consequent high temperature of the exhaust gases, but it is also frequently the cause of the back fires which do so much to strain

and injure even the best constructed engines. Driving on fuel consumption will bring these facts home to the amateur with a force that he cannot fail to appreciate. They will teach him, also, to what an extent driving against fuel consumption brings out all the qualities of a personal kind which it is of the utmost importance that a real racing competition should put a premium on. After all, to make a race interesting, the rules should be such that judgment, skill, and instantaneous appreciation of the best methods of surmounting the difficulties that present themselves, should largely affect the result. Practical experiment, of the kind we suggest, will certainly have the effect of showing the amateur how thoroughly the principles on which the Tourist Trophy is based, do this, and will increase his interest proportionately.

When is a Trap not a Trap?

THE Chairman of the Epsom Petty Sessions, in hearing a case with which we deal in another column, was very angry because the solicitor for the defendant referred to an ambush of policemen, disguised as *honest* labourers, with their paraphernalia of stop watches and waving handkerchiefs, as a "trap," and a brother magistrate maintained that a trap involves a bait, and that there was no bait. It is exactly what everybody has complained of, that a large number of police traps are so set as to virtually constitute baited arrangements. Where there is a nice clear stretch of road in the open country, with no traffic and possibly a slight incline downhill, this amounts to bait—a bait possibly which nature or circumstances have provided—but still a bait. The only difference is that in an ordinary trap you take the bait to the trap, but in these cases the trap is taken to the bait, but the bait is there all the same.

The Light Spreading.

THERE is no more picturesque old country town than the capital of eastern Sussex—that red-tiled cluster of old-world streets that seem to climb towards the castle whose Saxon arch dates from before the Conquest, and which looked out on Simon de Montfort's great victory on behalf of freedom and enlightenment. Naturally the old town is sleepy and unprogressive to the last degree. But there is no real reason why it should remain so. It is the centre, or rather perhaps the apex, of one of the richest agricultural districts of England—essentially a land of scattered farms and hamlets where means of communication are shockingly defective. If Lewes could gather together and focus the trade of eastern Sussex, it might become prosperous and even wealthy, and there is no reason why the automobile should not enable it to do so. At any rate, the very sensible proposal was put forward recently by Councillor Riekie, that services of motor 'buses and vans should be organised for connecting up Lewes with surrounding country centres. Trade in Lewes, it was admitted, is anything but what it ought to be, though probably it is exactly what it has been for centuries. We trust the Town Council of Lewes will be sufficiently enlightened to take the plunge, and if they do so it is quite certain that neither they nor the surrounding country will be likely to regret it. A good passenger service to neighbouring points too, would probably pay, as some of the most picturesque points of eastern Sussex would be accessible to tourists, instead of remaining as at present a *terra incognita*, owing to the great difficulty in reaching them.

So Earp has made another record—which is the time equal to the world's best—and the good people of Blackpool are in ecstasies, chuckling to themselves over the fact that after all their beloved town has wrested away the honour which Earp but a few days ago conferred on Brighton by establishing a new British record on that track.

His exploit was a thing to be proud of, for the track is not as perfect as some have thought it. In the middle is a slight bend made worse by the crosswise slope occasioned by the approach to the pier, this being clearly seen in our photograph of the course from the Blackpool Tower. So much did this affect the chances of the competitors that it was very generally thought no new records would be established on that track. Earp, however, is a Britisher, and therefore not to be beaten. In the class racing, his speeds, though the best, were not phenomenal, and it was after these events that he essayed his great task, first making a trial run the other way of the track, then a first attempt in which his time

BLACKPOOL MOTOR MEETING.—The finishing line. The final for the Darracq Cup.

There was another grievance, too, which might easily have had serious consequences, and that was allowing people to cross the track. It would, perhaps, have been unfair to have expected those not interested in the racing to have walked about a mile out of their way just to get to the other side, but there appeared to be some lack of discretion in the exact moments at which such transmigration took place. Dogs, too, were really a serious nuisance, and Miss Dorothy Levitt, who was again driving her 80-h.p. Napier in splendid style, was a prey to the canine pest to an extent that must have reminded her of Hereford.

Once more the Daimler cars have achieved great successes, Messrs. Percy Martin, E. M. C. Instone (in spite of dogs), and A. Birtwistle sharing the honours of driving the winning cars. Out of the five events for which they entered, these cars won three and were second in the other two. Stripped touring cars give a good spectacular performance, for not being built for this work they are distinctly light on the tread and their bouncing wheels give an even greater appearance of speed than do the racers themselves—an appearance, by the way, which is not altogether so far removed from fact as might be supposed.

Although the events were so successful from some points of view, yet there appeared to be a strong feeling that a motor meeting in the middle of the Blackpool season is not an unmixed blessing. It is not unlikely, however, that all racing events will undergo some modification before next year's programme takes place.

Though a large crowd was present—the general enormous holiday crowd of Blackpool—no one who was present could help feeling that interest in the events at times flagged considerably. It is probable that this was owing to the absence of what might be called effective “stage management,” the result being that the public were very largely in ignorance of what the particular events, and their special significance, were. If events of this kind are to maintain their interest, some better means will have to be taken in future for acquainting the spectators with the particulars of the events that are being run off before them.

BLACKPOOL MOTOR MEETING.—General view of the track from the Blackpool Tower.

was $21\frac{3}{8}$ secs., and then a last try in which he bettered that time by $\frac{1}{8}$ of a second and equalled the Baras world's record established at Ostend. Earp's average speed was 104.5 miles per hour.

On the first day Cissac improved upon his Brighton performance and also made a new world's motor-cycle record by covering the flying kilometre in $25\frac{3}{8}$ secs., which is equivalent to a mean speed of 87.38 miles per hour.

Such a tremendous crowd (largely of women and children) as has, during the two days' racing, attended at the Blackpool track, has never before been equalled in size at any British motor meeting, but whether they were rewarded for their interest is entirely a personal opinion; possibly the “giants of the track” which, as an enterprising reporter has it, “flash along like torpedoes of the road” did not appeal to everyone as satisfying their best ideals of sport. Except for the racing cars proper, all the other “giants of the track” were merely touring cars in disguise, and it was, perhaps, hardly the fault of the club if several of them did not turn up, but it was undoubtedly a pity that there were so many “walk-overs” all the same.

BLACKPOOL MOTOR MEETING.—The electrical timing apparatus at work.

*Lancashire Handicap (in heats).**Course about 1½ miles.*

*Motor Cycle Handicap (heats).**Course about 1½ miles.*

1. A. E. Lone (J.A.P.), 5 secs. start, won by 11½ secs.
2. J. F. Crundall (Humber), scratch.

*Special Events. Course about 1½ miles.**12-h.p. Darracq Cars.*

1. F. Jackson, 2 min. 36½ secs.
2. Mr. Bellian Davies, 3 min. 31 secs.

15-h.p. Darracq Cars (long chassis).

1. J. Keele, 2 min. 37½ secs.
2. Dr. Sindle, 2 min. 37½ secs.

15-h.p. Darracq Cars (short chassis).

1. J. Keele, 1 min. 59½ secs.
2. W. J. Wright, 2 min. 6 secs.

Darracq Cup Handicap (open to winners of above Darracq events).

1. J. Keele (15-h.p. Darracq), 42 secs. start, handicap time 68 secs.
2. J. Keele (15-h.p. Darracq), 5 secs. start, handicap time 1 min. 51½ secs.

Private Match. 1 mile.

1. H. du Cros (40-h.p. Mercedes). Won by 25 yards.
2. Nicholas Wood (50-h.p. Panhard).

SPEED contests of the kind held at Blackpool and Brighton form the subject of a very strongly-worded letter to the club Journal by Mr. Henry Norman, M.P. Mr. Norman's letter is practically a *resumé* of the arguments which we emphasized in particular on July 15th, and we are glad to find that he is so thoroughly in accord with THE AUTOMOTOR JOURNAL on this important subject.

BLACKPOOL MOTOR MEETING.—The Mayor of Blackpool and the prize winners.

*New Records.**Flying Kilometre (British Record, and equal to present World's Record).*

Earp ... 90-h.p. 6-cyl. Napier ... 21½ secs. = 104.52 m.p.h.

Flying Mile (British Record).

Earp ... 90-h.p. 6-cyl. Napier ... 37½ secs. = 96.25 m.p.h.

*Motor Cycle Records.**Flying Kilometre (World's Record).*

Cissac ... 12-h.p. Peugeot ... 25½ secs. = 87.38 m.p.h.

In tabulating the final results we have given the prize winners only for each particular event, but the time for each run of all the competitors will be found in two other tables, which are divided into Racing and Touring Classes only. In this way the regularity of running and the best times throughout both days can be compared at a glance.

BLACKPOOL MOTOR MEETING RESULTS.

*Racing Section.**Flying Mile (best average for three runs).*

1. C. Earp ... 90-h.p. Napier ... 38.07 secs. = 94.7 m.p.h.
2. A. Lee-Guinness ... 100-h.p. Darracq ... 40.70 secs. = 88.7 m.p.h.
3. Moore-Brabazon ... 90-h.p. Mors ... 43.07 secs. = 83.7 m.p.h.
4. Cagno ... 100-h.p. Fiat ... 47.07 secs. = 76.6 m.p.h.
5. Miss D. Levitt ... 80-h.p. Napier ... 52.20 secs. = 68.7 m.p.h.

Flying Kilometre (fastest time of three runs).

1. C. Earp ... 90-h.p. Napier ... 22½ secs. = 98.11 m.p.h.
2. A. Lee-Guinness ... 100-h.p. Darracq ... 24½ secs. = 91.68 m.p.h.
3. Moore-Brabazon ... 98-h.p. Mors ... 26 secs. = 86.03 m.p.h.

*Stripped Tourist Car Section.**(Cars not more than £1,250.)**Standing 1½ Miles (run off in heats).*

1. 35-h.p. Daimler (A. Birtwistle) ... 80½ secs. = 67.4 m.p.h.
2. 35-h.p. Daimler (P. Martin) ... 83½ secs. = 64.8 m.p.h.

Flying Kilometre (best average of three runs).

1. 35-h.p. Daimler (P. Martin) ... 30.5 secs. = 73.5 m.p.h.
2. 70-h.p. Darracq (A. H. Walker) ... 30.8 secs. = 72.6 m.p.h.

*(Cars not more than £1,500.)**Standing 1½ Miles (run off in heats).*

1. 35-h.p. Daimler (A. Birtwistle) ... 80 secs. = 67.5 m.p.h.
2. 35-h.p. Daimler (E. M. C. Instone) ... 81 secs. = 66.7 m.p.h.

Flying Kilometre (best average of three runs).

1. 70-h.p. Darracq (A. H. Walker) ... 29.9 secs. = 74.9 m.p.h.
2. 35-h.p. Daimler (P. Martin) ... 30.7 secs. = 72.8 m.p.h.

BLACKPOOL MOTOR MEETING.—The time-keeper's box.

THE DELAUNAY-BELLEVILLE PETROL CARS.

VERY few cars that have of recent years been put on the English market have attracted—merely by their appearance—more attention than did the Delaunay-Belleville chassis when it was exhibited in England for the first time—at the Olympia Exhibition of this year. It is not on account of any radical innovation that the chassis is remarkable—for *au fond* the car is merely an up-to-date example of the 4-cylinder chain-driven type—but it is because the details of its design render it particularly distinctive. It bears an unmistakable stamp of having been constructed by an old-established engineering firm, and altogether it is what might be expected as the product of the well-known Saint Denis Works in France, where the famous boilers are constructed. There is an elaboration in the design which at once catches the eye, and there is a solidity in the construction which gives an impression of great strength; the chassis is admittedly heavy.

The Delaunay-Belleville firm are making three sizes of chassis, viz., 16-h.p., 24-h.p., and 40-h.p., all of which are usually of the chain-driven type, although they also build the smallest model with a live axle and propeller-shaft drive instead, for those who may prefer it. In

general design, all the models are similar, so that our photographs and descriptions—which refer particularly to the 24-h.p. car—will apply in the main to all. Chief

amongst the many unusual features, which—as we have already inferred—appertain more especially to the refinements of design, are the following. The pipe-work on the engine is worthy of notice, and the system of forced lubrication is unusual. The radiator in itself calls for no comment, but its eccentric setting in

A 24-h.p. Delaunay-Belleville Car.

the circular brass case which forms the front of the bonnet, gives the finished vehicle a distinctive and, at the same time, neat appearance. The clutch itself has a simple leather-faced cone, but the arrangement of the clutch-spring, its adjustment, and the method of operation, are all very typical details which are quite in keeping with the general design as a whole. The gear-box is given a three-point suspension, and inside the gear-box, operating on the shell of the differential-gear, is a ratchet sprag. Properly speaking there is no dashboard, but the petrol tank, which is placed immediately behind the bonnet, serves as an inclined footboard, and on it are very neatly mounted the two pressure-gauges and the switch. Perhaps the most striking novelty is that the foot-brake is water-

Fig. 1.—View from the side of the 24-h.p. Delaunay-Belleville Chassis, showing the position of the petrol-tank, H, which forms the footboard.

Fig. 2.—The 24-h.p. Delaunay-Belleville Chassis, as seen from above. The large inspection-covers over the valves are visible in this view.

cooled by the circulation of water through the brake-shoes themselves, instead of by allowing it to drip into the revolving drum. Another important detail, too, is that all the bodies, which are secured to the chassis by four bolts only, are so constructed that the body can be slid backwards along the frame when these bolts have been removed.

The chassis is seen from the side, and from above, in Figs. 1 and 2 respectively, while an elevation, partly sectional, is given in Fig. 3. The frame is constructed of pressed steel, and the ends of the side members are bent inwards at the back to form part of the rearmost transverse member. In front of the dash the frame is narrower, to enable the front wheels to have a wide lock.

The construction of the under-frame, and the manner in which it is carried by the pressed steel members, passing across beneath it, is clearly shown in Fig. 11. The chassis is supported on ordinary semi-elliptic leaf springs, and a transverse spring is employed at the rear (see Fig. 2), in order to give increased flexibility of suspension. Both axles are steel stampings, having an \mathbf{I} cross-section; the front axle is of rather a curious shape, for not only is it bent downwards at the centre, but the curved portion projects forward as well. The steering gear is of the worm and sector type, and the forked steering heads, which are formed on the stub-axles, are arranged very close up to the hubs.

(To be continued.)

Fig. 3.—Side-elevation of the 24-h.p. Delaunay-Belleville Chassis, showing the gear-box in section.

A Brighton Item.—From the *Brighton Gazette* of July 29th:—

LATEST ARRIVAL: MISS BLAKER.

Congratulations to our Mayor. Another blessing born to some one. The latest arrival is, it is understood, to be called Mercedes, in honour of the Motor Week. Do be careful! If she is to live up to the name, she's bound to be fast.

ON Thursday last week, the new Merryweather self-propelled steam fire-engine, underwent an interesting trial at Worcester, doing a smart turn-out drill under Capt. Sayce. It ran to the bank of the Severn, where 35 feet of suction hose had to be laid to get water, and, in spite of the deep lift, a powerful jet was thrown over the principal tower of the Cathedral.

THE TURNER CARBURETTOR.

Three views of the carburettor are given in Fig. 1, the two upper views being taken from either side, and the lower being taken from *beneath*, looking up into the mixing-chamber (after the cover has been removed), and showing the fuel valve, B', through which the petrol is allowed to drip when the flat valve, C—shown in Fig. 2—is lifted off its seat by the suction of the engine. In Fig. 2 the other important component parts are also shown separately, while a sectional elevation of the carburettor is given in Fig. 3.

The mixing-chamber is formed by a single casting, A, which is provided with an induction-pipe, A', with main air fittings, A², and also with a fuel-pipe fitting for the attachment, B. The last-mentioned fitting is constructed in the manner shown so that an air-vent may be provided to prevent any air-bubbles from passing along to the jet. This is naturally a very important point

Fig. 1.—Three views of the Turner Carburettor, those above showing the device from either side, that below showing the interior (from beneath) and the positions of the fuel valve, B', and the throttle-valve seating, A'.

IN just the same way that the float-feed carburettor has been developed in this country and on the continent, so has there been a tendency in America to devote a considerable amount of attention to the "mixing-valve" type of carburettor, and this in spite of the great and increasing popularity which the float-feed carburettor itself has attained in that country also. "Mixing-valve" devices, which were mainly developed on account of their greater simplicity, and because they were supposed to be more suitable for use with kerosene as well as with ordinary motor spirit, have already been rendered familiar to our readers by the numerous illustrated descriptions which we have given of them, in their various forms, in the past.

The Turner Petrol Carburettor—which has just been introduced into this country by the Efandem Company—is of this type, and, like the majority of its prototypes, hails from the States, where it has already achieved considerable success. There are differences, however, which distinguish it from others that have previously come before our notice, and we have, therefore, taken photographs of it, both complete and in parts, to show the construction and action of this very simple apparatus.

The most important deviation from earlier forms is the combination of the main throttle-valve with a positive cut-off for the fuel, the whole being provided for by a flat leather-faced valve, which is automatically operated by the suction of the engine, but is subject at all times to hand regulation. The usual needle adjustment for permanently setting the effective bore of the fuel jet is, of course, retained in the Turner carburettor.

Fig. 2.—View showing the component parts of the Turner Carburettor, prominent among which are the needle valve, B', the throttle-valve, C, and the regulating mechanism, D, D', &c.

in a device like this, where the fuel is fed directly from the tank to the jet, and there is no intermediate reservoir—such as is provided by a float-feed-chamber—in which air-bubbles may rise to the surface and escape harmlessly to the atmosphere.

Fig. 3 shows the passage by which the fuel reaches the needle-valve, B¹, which can be adjusted by its small hand-wheel. The lower end of the needle forms a blunt cone and, when open, provides an annular passage for the fuel. The seating is machined inside a projecting boss cast solid with the main casting, and the boss itself has a flat surface at its lower end, so that, when the leather face of the valve, C, is pressed against it, the fuel supply is shut off—irrespective of the position of the needle-valve, B¹.

Fig. 3.—Sectional elevation through the Turner Carburettor, showing the construction of the mixing-chamber and the arrangement of the throttle-valve, C.

The valve, C, which is under the control of the spring, C², also has another seating on a ridge, A⁴, which projects, like a shelf, all round the interior of the main casting, A. When the valve, C, is closed, the lower side of the mixing chamber—which communicates with the engine through the induction pipe, A¹—is entirely shut off from the upper side, into which both the fuel and main air supplies are delivered.

Under the influence of the suction of the engine the valve, C, is drawn open, and fuel immediately begins to flow upon the face of the valve, from which it is swept off by the incoming current of air that enters the mixing chamber through the gauze-covered orifice, E¹. The main air supply pipe is fitted with a butterfly valve, E, which serves as a permanent adjustment, in the same way that the valve, B¹, does for the fuel, and by these means the best proportion between fuel and air may be established for any particular conditions of running.

It has already been mentioned that the valve, C, is controlled by the spring, C², but, in addition, a supple-

mentary spring can be brought into action when desired for throttling purposes. This supplementary spring, D³, forms part of the hand-control mechanism, which principally consists of the lever arm, D, the vertical spindle, D¹, and the rock-lever, D³.

The vertical spindle, D¹, is carried in the bracket, A⁵, which forms part of the main casting, A, and the rocking-beam, D²—which is provided with a roller, D⁴, at one end, and supports the spring, D³, at the other end—is carried by a small angular bracket, D², which is itself screwed to the lower end of the spindle, D¹. The roller, D⁴, rests on a guide-bar, C³, which is hinged both to the main casting, at C⁴, and to the lower end of the valve-spindle, C². By operating the lever, D, the spindle, D¹, may be rotated, and the roller, D⁴, brought to any desired position along the guide-bar, C³. The nearer the roller is placed to the valve-spindle, C², the more does the auxiliary spring, D³, aid the spring, C², in resisting the tendency of the suction to lift the valve, C, off its seats. When the roller is brought immediately under the end of the valve-spindle the "throttle" is closed, because the spring is made sufficiently strong to entirely overcome the suction of the engine. As the roller is moved further and further away, the suction on the valve has an ever-increasing leverage, through which to overcome the pressure of the spring, D³, until finally, when the roller is resting on the pivot, C⁴, the spring, D³, is placed out of action altogether, and the suction is allowed to have its full effect in opening the valve, which is then only subject to the control of the weak spring, C².

Compared with other carburettors of this type, it will be observed that the leather facing of the valve tends to eliminate the noise which would otherwise be caused by the periodic hammering of the valve on its seat. This valve, which entirely cuts off the fuel supply, prevents promiscuous dripping—one of the difficulties experienced in some of the early devices of this type.

Table of Reference Letters for the Turner Carburettor.

A	Mixing chamber.	C ²	Spring for C.
A ¹	Induction-pipe fitting.	C ³	Guide for D ⁴ .
A ²	Air inlet.	C ⁴	Fulcrum for C ² .

THE London County Council Fire Brigade Committee propose spending £1,880 on the purchase of two motor fire-escapes.

KING ALFONSO of Spain is developing a degree of independence of action absolutely paralysing to his Court, which is generally understood to be the most hidebound in etiquette of any Court in Europe. Without any warning to his entourage, who would probably have been ready with 57 major arguments, 150 minor arguments, and a couple of hundred weighty reasons why he should do nothing of the kind, His Majesty suddenly set forth at a high rate of speed in his motor car from San Sebastian. Consternation reigned. The telephones were set buzzing from one end of his Most

Christian dominions to the other, but the whereabouts of the monarch remained undiscoverable, till at last he was detected crossing the Pyrenees and finally turned up at Lourdes, where he visited the famous grotto, prayed for a number of the pilgrims present, as became "His Most Catholic Majesty," and ultimately set out again on the return journey to San Sebastian. The Government we learn are unanimous that something should be done to check His Majesty's unbridled enthusiasm, but nobody knows exactly what to do, and presumably nobody likes to be the first to do it. It will probably remain much like the resolution passed by the public meeting of mice, in favour of affixing a bell to the neck of the cat. The motion was carried *nem. con.*, but no one was willing to carry it into effect.

THE TOURIST TROPHY.

In placing the numerous communications that we have received with regard to our article on the Tourist Trophy before our readers, we take the opportunity of thanking the writers of these public contributions on the subject, and of also extending our most cordial thanks to those who, from one reason or another, do not feel free to publish their personal opinions, but have, nevertheless, written assuring us of their support, and explaining the causes for the natural reticence that they experience in the matter, at the moment. It has come as an agreeable surprise to us that so many of our readers, including most of the leading men associated with the industry, should have expressed their appreciation of our article, and it is particularly encouraging to see that the subject of the Tourist Trophy race is receiving the widespread attention that it deserves. There is no doubt that the question, when dealt with in the only way that it can be at the present time—in the abstract—is difficult and intricate, but it is to be hoped that the strong light which is thus being thrown upon it, from all and every point of view, may materially assist in its solution, and may lead to the establishment of a really satisfactory type of automobile contest, that is not only of a sufficiently simple character to appeal to everyone, but will constitute a true test of all the most desirable attributes of a perfect touring car, and will place a proper value on skilful driving.

The first of these communications appeared in our issue of last week, which also contained the concluding part—Part III—of the article to which they refer.

To facilitate reference to the various specific points upon which, in particular, our readers were invited to express their opinions, we reproduce our summary of the various suggestions put forward in the article, as also our list of the weights, measures and dimensions that are specified by the existing rules for the Tourist Trophy Race this year. Our readers will therefore be more easily able to follow the expressions of opinion contained in the following letters.

Suggested Modifications of Rules for Future Years.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

Specified Weights, Measures, and Dimensions in the Existing Tourist Trophy Rules for this Year.

- (A) *Fuel Consumption*—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

VIEWS AND OPINIONS OF OUR READERS.

Mr. W. Worby Beaumont:—

I have read your very excellent article on this subject. I subscribe to the following paragraph, which I quote with slight alterations from your first article: A racing event is, therefore, required for *touring* cars, but the rules must be such that no speeds undesirable or inexpedient, for touring cars can be indulged in, and that the winning cars shall be those the characteristics of which most completely meet their user's requirements, and those of other users of the roads.

It is unfortunate that the word "race" most completely describes the greatest attractions, but policy suggests that the word "competition" would more correctly describe the proposed event.

W. Worby Beaumont

Mr. John S. Napier:—

I have read with much interest your article on the "Tourist Trophy and its value to Car Owners," and have pleasure in giving my opinion on various points brought up by you.

Your suggested modification of the rules:—

1. *That the bodies be comprised of four independent parts*.—I do not see what benefit would be derived from this; in fact, I am inclined to think it would be a bad thing from a buyer's point of view, as it would increase the cost of manufacture, and, being in so many parts, would be liable to break down and give trouble.

2. *No cars to have engines with less than two cylinders*.—Here again I do not agree with you. Why should the maker of a one-cylinder engine car be excluded from the Tourist Trophy race? Surely it is for the public to say whether the article he offers is as good, or better, than those with a greater number of cylinders.

3. The same remarks apply as in No. 2.—Personally I believe that a variable change-speed-gear will come on the market, which will displace the present four-speed-gear.

4. *Any obvious freaks may be refused entry at discretion*.—I am inclined to think that the rules as to sizes can be drawn up in such a manner as to practically exclude what one might call freak; in any case, they have already been drawn up in such a manner as to exclude well-known touring cars built to-day, which may be considered freaks by the Automobile Club.

5. *Any unduly noisy car may be disqualified at discretion*.—I think this is essential. The difficulty is to gauge what is noisy and what is not.

6. *The race to extend over two or three consecutive days*.—I think this, as pointed out by you, would be better than one day's race, because it would induce more interest in it, and the general public would be more likely to come and watch the race. The small additional cost to manufacturers would not, I think, effect the entries in any way.

Nos. 7, 8, and 9 are, I think, as they should be.

10. *Cars to be driven by different drivers each day*.—This, I think, would be a hardship to most firms, as a number, I have no doubt, have not six first-class drivers capable of taking part in a race available at the time when the race is to be held.

11. *A Class to be instituted for two-seated cars to compete separately*.—I think it would be a good thing for a race to be held for small power cars, but not necessarily two-seated cars, having, say, a fuel consumption of 35 to 40 miles per gallon as a basis.

With reference to the present rules, there are only two points which I think require altering, viz. (1st) the weight of the chassis, and (2nd) the weight of the body. Naturally manufacturers for this race are endeavouring to keep the weight down to the minimum, but in my opinion it is impossible for a manufacturer to turn out a really reliable chassis suitable for touring purposes, fitted with an engine of, say, 15 to 20-h.p., and weighing only 1,300 lbs. Undoubtedly this chassis will be turned out for the race, but in my opinion, it will only be a racing chassis, and, as such, more or less of a freak, which the club are trying to prevent.

Again, with reference to the weight of the body, the rules say that the body, including lamps, rear mudguards, &c., must weigh 350 lbs. Now a large, roomy, side entrance body, built of either wood or sheet steel, will not weigh more than 3 cwt., and yet for a

small car and a light frame the Club insists on 350 lbs., which to my mind is ridiculous. If they had made the minimum weight of the chassis say 1,400 lbs. and the minimum weight of the body 250 lbs., I think they would have been nearer the mark.

I feel convinced that the rules as set down will bring forward a great number of freaks, and the manufacturer who enters his standard car for this race will, I think, have no chance of winning. It is true that the Club insists on a guarantee that the manufacturer will deliver within a reasonable time a similar chassis to the one entered in the Trials; of course, most manufacturers will be quite pleased to do this, because probably the price quoted for the chassis will be a paying one.

I feel convinced that this race, if properly managed by the Automobile Club for the benefit of the buying public, will develop into the race of the year, and it will certainly help towards the advancement of automobile science; more so, I am inclined to think, than even the Gordon-Bennett races do.

Mr. Walter G. Wilson:—

I have read the article on the Tourist Trophy with interest, and while I agree in the main with the aims that the promoters of the race have in view, I think there are several serious drawbacks to the conditions as at present laid down. For instance, I suggest that instead of making a fixed maximum quantity of petrol allowed for a car, cars should start with a given amount of petrol, that they should be allowed to take in petrol in control and penalized by having to stop so much longer in that control according to the amount of petrol taken in.

This penalty for petrol could easily be decided on, and I would suggest something between 2 and 4 mins. per pint. This would overcome any liability of a car stopping short of the winning post, except through negligence on the driver's part, and the penalty could be made severe enough to prevent high speeds.

I certainly agree with you that the race is far too short to be called a tourist event, and it seems to me that under the present conditions a very light car, with an exceedingly short life, would stand as good a chance, or better, of winning as a car made to last a considerable period. I think the penalty on too light constructions should be enforced by making the cars carry considerable more weight than they would be required to carry in actual practice. I agree with you as regards the desirability of not allowing the body to be used as part of the frame, and think that some rule, such as you suggest in modification No. 1, should be introduced. I also suggest, with a view to the encouragement of steady running, *i.e.*, good speed up hills without excessive speed down them, that all cars should be made to carry a glass screen, such as is generally used on touring cars, so as to increase the windage, the overall dimensions being specified. As wind resistance alters as the square of the speed, good engine power could be employed without any fear of the speed becoming excessive. I think it is of very great importance that this contest should be a race with a view to attract public attention and interest, and I think if my suggestion of penalising petrol consumption by so many minutes per pint were adopted, it would be possible to so regulate the contest that first man in wins, which is always an attraction. I should suggest that it be done in this manner:—Assuming the penalty to be two minutes per pint, the car to start first would be given, say, 1 gallon of petrol, two minutes after that the second car would be started with 1 gallon and 1 pint, two minutes after that the third car with 1 gallon and 2 pints, and so on. They would then have to stop at various controls to pick up their petrol, and you will see that the start given to the first cars in the form of time is given to the latter cars in the form of petrol, thereby making them all start equal. I think the manufacturers could have no objection to a long race extending over several days, but this, from the public's point of view, would not of course be so interesting. What is required is, say, 1,000 miles to wear the cars down, and then the race. The difficulties of carrying this out would, I am afraid, be very great. I think, however, that a good race could be made by running under racing conditions each day, and the cars starting with a time advantage of half of what they finished with the previous day. This would have the effect of keeping the cars close together from public interest, and would make a delay due to wear much more important than a small

accident, which might occur in the early stages of the run. It would, of course, give the steady running car a continual growing advantage over its competitors.

I shall read the discussion of the conditions of the Tourist Trophy with great interest, and shall have much pleasure in amplifying or explaining any suggestions I have made, should you wish me to do so.

Mr. Charles Jarrott:—

I have read with the greatest interest the article appearing in THE AUTOMOTOR JOURNAL on the Tourist Trophy Event. I think that the points have been dealt with in such a thorough and complete fashion by you that it would be almost presumption on my part to add anything further. At the same time there are one or two points which occur to me in connection with this event which I think require dealing with if the event is to be valuable and instructive.

The first point which occurs to me is in connection with the actual conditions in regard to weight, &c.

I think the weight of the chassis, and of the complete car, is put at much too low a figure.

It must be borne in mind that the requirements for a touring car at the present day call for the production of a car which is large and roomy, and capable of carrying four or five persons comfortably, with a certain amount of luggage.

In order to secure the carriage body being luxurious in comfort, it has necessarily to be made large and roomy. This necessitates weight.

In addition to this, it is expected that even if an excessive speed is not secured on the level, nevertheless the car should have good hill-climbing capabilities even when fully laden, thus necessitating a fairly powerful engine, this, in turn, making it necessary for the chassis to be of very strong and solid construction if it is intended that the car should stand hard wear over different kinds of roads.

All this tends to a heavier type of car, and I think that when it is put forth that the Tourist Trophy event is for competitions between cars supposed to be "ideal touring cars," even the most generous critic would say that the weight regulations err on the side of lightness, if it is intended that the vehicles that take place should be of sound commercial design and construction.

Personally, I have an idea that if a competent committee specified a minimum weight of chassis of such a design and construction as would be capable of carrying a first class touring body—as we know a touring body at the present time—and this extra weight were arranged for in the regulations by giving a larger margin for petrol consumption, that a more desirable breed of car would be obtained.

To sum the matter up briefly, I think the weights for the cars in this year's contest have been put at too low a figure.

Regarding your suggested modifications to the Rules, I think these are all excellent, and will undoubtedly tend to make the test a fairer one for the competitors. Obviously these modifications cannot be made this year, but I certainly think they deserve every consideration for next year's event.

The whole competition is one of the very greatest interest, and it is rather difficult at the present time to know exactly how it will shape. We shall know much more about it after the first trial has been made in the Isle of Man, when I have no doubt that a number of valuable lessons will be learned.

At the present stage of the industry, when speed pure and simple is discountenanced and there is at the same time a necessity for obtaining knowledge, I think that a competition of the nature of that for the Tourist Trophy is of the utmost value, and I hope that it will receive consideration on the part of the Continental manufacturers, and develop eventually into a keen international contest.

BRITISH INTERNATIONAL CUP— THE ELIMINATING RACE.

RESULTS OF THE ELIMINATING RACE FOR THE B.I.C.

Boat.	Times per Lap (5 Miles).							Total Time for Course (35 Miles).	Average Time per Lap.	Average Speed.
	1st.	2nd.	3rd.	4th.	5th.	6th.	7th.			
	m. s.	m. s.	m. s.	m. s.	m. s.	m. s.	m. s.	h. m. s.	m. s.	m.p.h.
Napier II. ...	15 2½	17 50½	19 4	13 51	13 42½	13 56	13 57½	1 47 23½	15 20½	19.8
Brooke I. ...	17 43½	17 16	23 43½	19 57½						
Competitor ...	24 28½	23 0½	24 7½	27 22½						

NOTHING could have been more auspicious than the really gloriously fine day which the Fates provided for the premier motor boat race held in British waters this year. When the B.I.C. Race itself took place off Ryde last year, the weather—it will be remembered by those who were present—was equally propitious for an hour or two, and then, with a suddenness which was very disconcerting to those unprovided with suitable apparel, the rain descended in torrents, and provided a sombre setting for the fine finish of the successful but disqualified Napier Minor. This year there was naturally not the same importance attaching to the eliminating trials as would have been placed on the actual race itself, and fewer people attended in consequence.

In the forenoon the Motor Yacht Club—which body now controls the motor boat events of the A.C.G.B.I.—held a regatta for cruisers, but although the only event which did take place provided evidence of good handicapping, the result being a win for Mr. Miall-Green's Hummono, yet it was hardly of an exciting nature, and no one took very great interest in it, all being keen upon paying visits to the various racing boats lying off the pier-head.

Of the five entrants for the Eliminating Race, four were in evidence, Hutton II being the only absentee, and most of them were busy making final adjustments to their engines, it being seemingly impossible for any competitor in such events to be quite ready at any appreciable time before the event. One agreeable surprise was awaiting those interested in the presence of Brooke I. which, it will be remembered, broke a cylinder during a trial run last Monday week. It had naturally been thought impossible for this boat to be ready in time, and, in fact, as we recorded in our previous issue, Mr. Mawdsley Brooke and Capt. Corbet, the co-entrants, had already petitioned the club for a postponement of the race. As a matter of fact, however, a new cylinder was actually cast, machined and fitted in under five days, and although the engine was not tuned up properly, the boat was at least ready to start, thanks to this very creditable piece of quick work. At half-past twelve the starting gun was fired, and

competitors were then at liberty to cross the line and commence the race. Any boat not crossing within three minutes of that time being disqualified from becoming the winner (technically speaking) and from receiving the bronze replica of the Trophy which might otherwise fall to his share should he actually make the fastest run over the course.

Lieut. Mansfield Cumming's "Competitor" was first away, and nearly two minutes behind came Lord Howard de Walden's "Napier," followed after about a one-minute interval by Brooke I., the latter boat actually crossing the line after the "three minute" time limit. For the time being these were the only boats to start, and it was not until 12.51 p.m.—when Brooke I. had already completed one lap—that Napier II., with the Hon. J. Scott Montague at the helm, and Mr. Lionel de Rothschild on board, at last got away.

Almost immediately after starting, Lord Howard de Walden's Napier boat was put out of the race by a steering wire breaking, the boat running full tilt into a yawl which was lying at her moorings. Brooke I. created considerable excitement by her apparent high speed during the first lap, but her actual time does not show anything very fast, and indeed appearances were possibly somewhat deceptive owing to the extraordinary amount of bow wave and spray which this boat throws

BRITISH INTERNATIONAL CUP.—View of the Brooke-Corbet Racer, "Brooke I," just off for a trial run. This craft, which has a six-cylinder engine of enormous power, has already proved itself to be capable of attaining extremely high rates of speed, but, unfortunately—as recorded last week—one of the cylinder-heads was smashed recently, owing to the breakage of an exhaust-valve. It was however, found possible to replace the damaged cylinder in time for the race.

even speed, with a hot crankshaft bearing, so there were the two rivals for second place (Napier II. having then completed the course) "hung up" in the Solent, and both working their hardest to get under way again and complete the remainder of the course—which, however, neither of them did.

As to the "Napier II.," that boat, once going, kept on, and, overhauling both "Brooke I." and "Competitor," finally completed the full course of 35 miles in the actual running time of 1h. 47m. 23 $\frac{1}{2}$ s. giving a mean speed of 19.8 miles per hour.

From a spectacular point of view, there was

no great attraction in the race, though the tedium of the event for several of those who witnessed it was considerably relieved by the generous hospitality of Mr. S. F. Edge, represented by "skipper" Evans, on board that well-known craft, "Napier Major."

The course was certainly an improvement on that of last year from some points of view, and spectators from the pier could with reasonable clearness distinguish the boats from end to end of it, which would have added very much to the interest had there been anything very interesting to watch. At the time of going to press, the club have not made any definite announcement with regard to the result of the event, and there would appear to be several knotty points to settle, the results of the deliberations on which will, it is to be hoped, leave no room for doubt about future events of this character.

BRITISH INTERNATIONAL CUP.—Side view of the six-cylinder engine of "Brooke I." This engine, which runs at a normal speed of 900 revs. per min., has cylinders of 10 in. bore by 8 in. stroke. A special carburettor of the "Bradley" type feeds all six cylinders, the crank-shaft is a solid nickel-steel forging, and the power is transmitted to the propeller-shaft by a metal-to-metal expanding clutch.

up. From the first, her engine was never running properly, and the misfiring became worse as the race proceeded, but it was the choking of the bilge pump which finally brought Brooke I. to a standstill after completing four out of the seven rounds. In justice to Mr. Mawdsley Brooke's plucky attempt, it should be stated that he was under the impression—through official information—that the crew was limited to two men, whereas the other boats carried more than this number. Had Mr. Brooke been possessed of additional help, there is every reason to suppose that he could have kept the bilge dry with the hand-pump, or at any rate have kept the water off the ignition circuits and magneto, which was the direct cause of the final stoppage. "Competitor" also came to a standstill, after doing four complete rounds at a comparatively slow but

BLACKPOOL MOTOR MEETING.—At this meeting, four of the 35-h.p. Daimler Tourist Cars were stripped completely for racing, it being the first time that the Company have "cleared the decks" of their standard touring carriages for the purpose. Our photograph shows these speedy vehicles in all their nakedness, the cars being driven respectively by Mr. Charles Hardy, Mr. A. Birtwistle, Mr. Percy Martin, and Mr. E. M. C. Instone. Mr. Alfred Bush, who is head tester for the Company, is also in the group which we reproduce.

MOTOR BOATING.

RELIABILITY TRIALS FOR MOTOR BOATS.—The Thornycroft boat, "Capitaine," which is fitted with the Capitaine suction producer. Since describing this plant in our issue of July 1st, 8th, and 15th, Messrs. Thornycroft, who own the sole British rights, have introduced several important modifications, with which we hope to deal shortly.

Motor Yacht Club's Reliability Trials, 1905.—Delightful weather favoured the opening of this event on Wednesday, in which altogether thirty-two competitors took part, all the boats coming up to the starting point with the exception of those entered by Mr. J. M. Gorham (Daimler) (No. 16), the Fiat Motors, Limited, 40-h.p. craft (No. 23), Messrs. C. S. Rolls and Co., Limited, (No. 24), Mr. J. H. S. Phillips, 16-h.p. Vosper (No. 31), and the Kensington Motor Boat Company, 20-h.p. yacht (No. 34). All particulars of the competing boats were given by us in a full-page table last week.

Trouville, the stages were for cruisers; July 25th, Rouen to Caudebec; July 26, Caudebec to Havre; 27th, Havre-Trouville. The racers ran the same course in two stages, on July 26, Rouen-Havre; July 27, Havre-Trouville. In the racing section, La Rapière was first in the 8 metre series in 2h. 25m. 51s., and Antoinette III. second, in 2h. 37m. 43s. In the 12-18 metre class, Dubonnet was timed for 3h. 32m. 9s. In the cruiser section, the best time was made by Delahaye VI. of 3h. 23m. 44s. Dalifol I., the only fishing boat which went over the course, was timed for 7h. 14m. 1s. Altogether, 19 boats were classed over the full distance.

Coupe de Trouville.—

Although sufficient motor boats took part in this race, organised by *Les Sports*, and run between Rouen, Havre and Trouville, to make a decent showing, it can hardly be regarded as the huge success which the published list of entries would have led the public to have expected. The Gaston-Menier Cup was even more barren, the only boat which was in place to dispute its ownership being La Rapière which indulged in a "walk over" the three marine miles specified in the rules. The time given for the distance is 7m. 22s., beating Fournier's time of last year on the Hotchkiss of 8m. 27½s. For the Coupe de

Two views of the 6-h.p. Thornycroft Petrol Marine Engine, as fitted on one of the boats in the Trials. The cylinder casting for this model is identical with the well-known 24-h.p. four-cylinder engine, which is used in their latest touring cars (described with illustrations on February 15th last). The crank-chamber in a different manner however, for the valves on the smaller model are placed in line with the crank-shaft.

—The series of events in connection with the newly-inaugurated Motor Week, included several first of these was run off on Friday of last week for cruisers over a distance of 20 kiloms., nothing startling being accomplished. On Saturday a more ambitious race was competed for, viz., 100 nautical miles. This took place over a circular course of 12½ kiloms., which was covered 15 times, the first prize being secured by Dubonnet, in the time of 5h. 35m. 55s., Delahaye VI. was second, in 5h. 43m. 51s., and Dietrich II. third, in 6h. 37m. 35s.

View of the Iris marine set which is fitted to the "Iris," entered by Messrs. Perman and Co., for the Reliability Trials. The plant is constructed by Legros and Knowles, whose British-built car attracted so much attention at Olympia this year.

Smoke or Steam?—We have received a communication from the Motor Van and Wagon Users' Association pointing out that the Metropolitan police are proceeding to prosecute wholesale any steam motor wagons and tractors that may be observed emitting smoke or steam. A number of convictions in such cases have been already secured, the London County Council being the actual prosecutors, and, of course, the greater the number of cases in which convictions are obtained, the more magistrates are disposed to convict in any fresh case. The Association are accordingly anxious that all van users should put up as good a fight as possible, whether the owner of the van appears in person, or is represented by a solicitor. The Association specially points out that:—

The police have shown themselves unable to distinguish between black smoke and exhaust steam. Consequently if a driver is ever stopped by the police, and asked for his name and address on the ground that he is emitting either smoke or visible vapour, he should immediately obtain the names of at least three witnesses amongst the bystanders if possible, who would be willing to come forward as witnesses, explaining at the same time that they will be indemnified for any expense to which they may be put.

He should report the case immediately to his employers, giving the names of witnesses that he proposes to call.

The owner of the vehicle on receiving the driver's report that a prosecution is probable, should make a note of the fuel which was supplied to the vehicle on the day in question, and obtained a delivery note for it—both being intended for use in the defence.

It would appear that one of the solicitors regularly appearing on behalf of the County Council in these cases invariably asserts that convictions have been obtained in all the cases in which prosecutions have been instituted. This is an excellent ruse, and always influences the magistrates, but it is simply not the truth, and, in any case, is a statement which no solicitor ought to be allowed to make unchallenged.

A case in which a prosecution of this vexatious kind was very summarily dismissed, came before the Guildford Bench a short time ago. George Mitchell, a driver for Messrs. Plumridge and Co., of High Wycombe, was summoned for being the driver of a locomotive which did not as far as practicable consume its own

smoke. After the hearing of a lot of conflicting evidence, in which the extraordinary statements were made that if anthracite had been employed the boiler would have been fused, *and* more smoke produced, the case was dismissed. This decision is of some importance, as the Guildford Bench is notoriously non-progressive.

There is another point, too, in connection with such prosecutions. Provided the motor vehicle is *designed* not to diffuse smoke or visible vapour, a prosecution will not lie merely because it happens from some accidental or temporary cause to be emitting such products. If a vehicle is not designed to do this, it is a traction engine, and does not come under the immunity conferred by the Act of 1896, but if it is so designed it does not cease to be a motor car or light locomotive, and become a traction engine, simply because it is climbing up a hill, or because some of its arrangements are not working properly, and it therefore happens to be temporarily emitting smoke.

Visible Vapour.—A conviction has been recently obtained at Bow Street Police Court, under the Parks Regulation Act of 1872, against an automobilist whose car emitted a considerable amount of disagreeable smoke from the exhaust. The extent to which this defect in car management is increasing is becoming very serious, and is certainly not likely to benefit the automobile movement. Whether, however, it is an offence legally punishable under the motor car acts, unless it is a permanent defect of the car, is more than questionable, and it is significant that this prosecution was instituted, not under these Acts, but under the Parks' Regulation Act. At the same time it is to be hoped that motorists generally will not take advantage of the rather loose wording of the Act in this respect, as the careless diffusion of smoky exhaust is far worse than any mere technical offence against the Acts themselves—it is a serious source of annoyance to other road users, and the fertile cause of irritation and hostility to motor cars second only to the dust nuisance, and as it is avoidable it is inexcusable.

CORRESPONDENCE.

* * *The name and address of the writer (not necessarily for publication) MUST in all cases accompany letters intended for insertion, or containing queries.*

THE IVEAGH-PIRRIE IRISH SCHEME.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—I have read with some surprise a paragraph on page 885 of the AUTOMOTOR JOURNAL, entitled "This Smacks of Priestcraft," and should like to know where the writer got his information. I happen to know a little about the matter, and give you the following facts: The South Riding County Council of this county (Tipperary) have three steam rollers constantly at work, and the North Riding two. The result is that every year a considerable mileage is steam-rolled, but when the Pirrie-Iveagh scheme was proposed, the County Council undertook to steam-roll specially any of the routes selected. The P.-I. Syndicate has since made no move towards establishing a service in this district (nor, as far as I can know, in any other), though the County Council have offered them the facilities above referred to. Being a motorist and a District Councillor, I take a keen interest in this matter, and know from personal experience that the motive to which you attribute the failure of the P.-I. scheme has absolutely nothing to say to it.

I regret to see that a paper of the standing of THE AUTOMOTOR JOURNAL has published such a libel on this country without having taken care to verify the statements.

Yours truly,
Ardfinnan, Co. Tipperary, FRANK MULCAHY.
26th July, 1905. HI—25.

[We would point out to our correspondent that the information on which the paragraph to which he takes objection was based, consisted of an official statement made in Parliament. We need scarcely add that we are pleased to learn from Mr. Mulcahy that the North and South Ridings of Tipperary must evidently be excluded from the general indictment.—ED.]

AN INTERNATIONAL TOURIST RUN.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—The very successful conclusion of the Siddeley v. Meyan match has suggested the possibility of a big International Competition on similar lines being run off abroad next year.

From reading the account of the route traversed by both cars, it is obvious that only vehicles of very robust construction could possibly stand the enormous strains.

I think if such an idea were started, no form of competition would be more useful or helpful to the various constructors, as a route extending over five thousand kilometres would be sure to find out the weak spots in every car entered, and at the same time, as an International Competition, it would attract enormous public interest.

The vehicles would, of course, have to be limited in horse-power, and I trust that such an event will be held, and that the first event will be run off next year. As a matter of fact, it should partake of the nature of a competition similar to the Tourist Trophy Competition which has been arranged in the Isle of Man this year, but it would have the advantage of being run over a very much longer distance and over much more severe roads with a continual change of scenery. Yours faithfully,

CHAS. JARROTT.

THE RACE MEETINGS OF 1905.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—To the genuine tourist, and to the man who is ready to purchase a car thoroughly tried in regard to reliability, staunchness, silence, and simplicity, I venture to say that the automobile events of 1905 have done nothing to improve his knowledge.

I take it that every buyer of an automobile expects to use his car chiefly for touring, which is the legitimate and most noble use a car can be put to, as it increases geographical knowledge and is world-wide in education. Yet neither the Eliminating Trials, the Gordon-Bennett, the great four-day Brighton Meeting, or the Blackpool event have assisted the tourist in his selection of the best touring car.

Races for touring cars on specially prepared tracks of a mile or so are the dulllest entertainments imaginable. Even the automobile Press of this week draws attention to the weariness and monotony of track racing with touring cars.

Competitions of cars of the same make and horse-power in a class to themselves on the track should produce very close finishes, but they only seem to centre the interest on the drivers, and the

personal equation is the principal factor. But may I ask why the following leading makes were not represented in the touring events at Brighton:—Richard Brasier, De Dion, Renault, Mors, and only two small Panhards, Napier (no touring cars), Wolseley, and Argyll.

There are more touring cars in existence of the above-mentioned makes than any other eight firms in the world, yet the great Brighton meeting failed to attract a single entry of cars of these makes. This fact clearly shows how unattractive track races are to tourist cars.

The Gordon-Bennett is dying, racing cars on the road are daily more condemned in England, and track racing will fail to attract when once the sensation of seeing a car pass at 100 m.p.h. has worn off. Blackpool was merely an invitation to lower records over a magnificent track.

We must look, therefore, to the Automobile Club's first attempt this year to encourage the genuine touring car, and I personally regret this attempt was not commenced a year ago; however the day has come when the public want a car to do a 100 miles a day, for many days consecutively. To run 100 miles on its fuel tank, and to cost no more than £100. Such a car is not, perhaps, forthcoming yet, but it is not far off, and perhaps the coming contest for the Tourist Trophy will tend to produce such a car.

I am somewhat afraid this year's Tourist Trophy can be won by a car specially built for the course and distance with a special light and fast tyre, not exactly a freak, but a car you would not choose for all-round hard knocking about on the Continent.

The fuel consumption limitation is intended to suppress monster engines, but that can be done by other regulations, and I do not attach much importance to a car that can cover five or ten miles further on a gallon of petrol when touring tanks are supplied holding fuel for 300 miles and petrol at 7d. a gallon. A limit of weight to save tyres is what the tourist wants.

In my opinion the only competition thoroughly instructive to the tourist, is the Siddeley-Meyan contest. Any car which can be driven round France under these hard conditions, without sparing the car, in the recent hot dusty weather, and at the end can survive a critical inspection and pass sound before the judges is a most desirable car for the tourist.

I am not interested in this match and am without details of the condition of the cars, but I am convinced that this is the kind of competition which touring cars should be encouraged to enter for by the Automobile Club, and as any road contest in England raises wrath, indignation and dust, I see no objection to following the Siddeley-Meyan route from Boulogne, round France, back to Boulogne, or the route taken by Cormier in a De Dion touring car prior to the Paris Salon, 1903, and let the first three cars in this competition be exhibited at the November Olympia Show. An inspection by the tourist of the best touring car would bring more orders to that firm than the winning of any of the racing events of 1905.

Yours faithfully,
July 31st, 1905. ROGER H. FULLER.

⊗ ⊗ ⊗ ⊗
The New Napier Switch.—A neat and handy switch is a great advantage on a car, for it enables the ignition to be cut off by the driver without bending down to the dash or requisitioning the services of the passenger.

The six-cylinder Napier cars are now provided with the useful little contrivance illustrated above, which is placed in the centre of the steering-wheel. When the small knob is pulled up, the current is cut off, the notched slot preventing any accidental change from "on" to "off."

RACES, RECORDS, AND TRIALS.

French Commercial Vehicle Trial.—

This very important competition, of which we have from time to time given preliminary particulars, commenced on Thursday of last week, July 27th, when the big vehicles carrying over two tons of freight were dispatched from the Tuileries at 5.30 in the evening. The competing vehicles were divided into two categories, viz., public service vehicles, and commercial goods vehicles, both of these again being sub-divided into categories, the first for vehicles carrying from 6 passengers up to 30, and the second for motor cycles carrying under 50 kilogs. of goods up to vehicles transporting over 2,000 kilogs. of freight, an additional class in both categories being provided for road trains of several vehicles. In addition, provision was made in the second category for testing wagons

FRENCH COMMERCIAL VEHICLE TRIALS.—Weighing operations at the Tuileries. The De Dion Bouton omnibus (No. 51) being weighed.

(B). *For vehicles carrying over 500 kilogs. of goods and the military wagons.*

July 28th, Paris, Creil, Compiègne, 95.5 kil.
 July 29th, Compiègne, Montdidier, Amiens, 73.7 kil.
 July 30th, Exhibition at Amiens.
 July 31st, Amiens, Blangy, Dieppe, 98.9 kil.
 August 1st and 2nd, Exhibition at Dieppe.
 August 3rd, Dieppe, Fécamp, Havre, 105.6 kil.
 August 4th, Exhibition at Havre.
 August 5th, Havre, Caudebec, Rouen, 88 kil.
 August 6th, Exhibition at Rouen.
 August 7th, Rouen, Gaillon, Mantes, 79 kil.
 August 8th, Mantes, Paris, 53.5 kil.

The Trials, which are now in full swing, appear to be resulting very satisfactorily for a large number of the competitors, the De Dietrich and De Dion vehicles appearing to be scoring particularly well. In the case of the military wagons, each one is accompanied by an officer in the army representing officially the military

FRENCH COMMERCIAL VEHICLE TRIALS.—The N.A.G. road train (No. 9).

specially built to the specification and to comply with the requirements of the French army. Altogether, 55 vehicles started in these divisions, the rest of the competitors, beyond the vehicles carrying over two tons, being dispatched on the morning of July 28th at 5 o'clock. The distances and routes were different each day for the two categories. These are clearly shown in the sketch-map which we publish this week. The stages were as follows:—

(A). *For public service vehicles, and for vehicles carrying 500 kilogs. of goods.*

July 28th, Paris, La Ferté-Milon, Soissons, Compiègne, 153 kil.
 July 29th, Compiègne, Saint-Quentin, Amiens, 148½ kil.
 July 30th, Exhibitions at Amiens.
 July 31st, Amiens, Doullens, Abbeville, Dieppe, 133.4 kil.
 Aug. 1st and 2nd, Exhibition at Dieppe.
 Aug. 3rd, Dieppe, Fécamp, Havre, 105.6 kil.
 Aug. 4th, Exhibition at Havre.
 Aug. 5th, Havre, Neufchâtel, Rouen, 150.8 kil.
 Aug. 6th, Exhibition at Rouen.
 Aug. 7th, Rouen, Gournay, Vernon, Mantes, 130.8 kil.
 Aug. 8th, Mantes, Saint-Germain, Paris, 53.5 kil.

FRENCH COMMERCIAL VEHICLE TRIALS.—Some of the military wagons. No. 81, a De Dietrich vehicle; No. 88, a Latil wagon; No. 82, the Gardner-Serpollet.

authorities, and to the successful firms important business should subsequently accrue. *En route*, some consumption tests are being made, especially in regard to the omnibuses, and as far as these have transpired the quantities consumed over the stage on July 29th (148½ kiloms.), are announced as follows:—

30-seated Eugene Brillie omnibus (No. 54), 57 litres of 50 per cent. alcohol mixture.

30-seated Mors omnibus (No. 53), 90 litres petrol.

Gardner-Serpollet omnibus (No. 47), 150 litres paraffin oil.

FOLLOWING the system adopted by the British Club during their 1,000 miles reliability test, exhibitions are being held at the chief towns visited by the competing vehicles *en route*. The importance of these trials is fully recognised on this side of the Channel, and we learn that the Motor Van and Wagon Users' Association have duly appointed a deputation to attend the exhibition of the vehicles, held on Friday of this week at Havre. It is to be hoped that when the trials are concluded, the fullest possible data of facts and figures throughout the trial will in due course be forthcoming from the French Club; they should prove of immense value to constructors and users throughout the world.

THE Spa Automobile Week, which was to commence last week, was at the last moment postponed until September 23–30, owing to the multiplicity of events at the present moment rendering doubtful the prospect of anything like an adequate number of entrants. Several other postponements or cancellations of meetings in France are also freely spoken of, a consummation to be devoutly hoped for by a number of the manufacturers and others, who find the multiplicity of organised events in various parts of the country a severer tax upon their time and pockets than it is possible for them to cope with.

Ardennes Circuit.—To-day (Saturday) the commencement of the formalities for the race on the Ardennes Circuit takes place, and it is announced in France that the two Wolseley racers will be driven respectively by the Hon. C. S. Rolls and Mr. Bianchi. Unfortunately this is not correct, as neither the Wolseley cars nor Messrs. Rolls and Bianchi will take any part in this race. There is, however, we are afraid, more truth in the statement that the three Fiat cars which were entered, to be driven by MM. Lancia, Nazzari, and Cagno respectively, have been scratched, mainly for the reason that they are to be reserved for the Brescia Automobile Week and the Vanderbilt Cup. Italy will therefore have to rely in this race on Fabry, who will drive a 100-h.p. Itala car.

Herkomer Trophy.—We recently referred to the British entries of five Daimler cars for this important event, which commences on Thursday of next week. Four of these cars are, we now learn, of 35-h.p., and are to be driven respectively by Mrs. Manville, Mr. Manville, Mr. Philip Dawson and Mr. Bush. The fifth car is of the 28-h.p. type, and Mr. Herdman Ash will be at the wheel of this carriage. The cars left London on Wednesday of this week, travelling *via* France to Munich, where the event takes place, and we heartily wish the British company success for their enterprise in competing in this Continental fixture, and hope to see them bring back the beautiful trophy, of which we gave a photograph last week.

“THE PYRENEES CUP” is the title of a contest inaugurated by the Toulouse journal *La Dépêche*. It will take place from August 20th to 27th, and is only open to touring cars.

FRENCH COMMERCIAL VEHICLE TRIAL.—Map of the itineraries for each of the classes.

THE SIDDELEY-MEYAN MATCH.

As we announced briefly last week, the reliability match between M. Paul Meyan's 24-h.p. De Dietrich and Mr. J. D. Siddeley's 18-h.p. car ended on Wednesday last in a dead heat, both cars having successfully carried out the conditions of the match. The stakes of £400 were therefore divided.

The match, which has created quite a little stir in automobile circles, both in England and France, was, it will be remembered, the outcome of a challenge by M. Paul Meyan, a French journalist, to run his 24-h.p. De Dietrich for reliability against any English made car. The challenge was promptly accepted by Mr. J. D. Siddeley, of the Wolseley Motor Car Company. The conditions provided that the cars should travel 4,400 kilometres (2,750 miles) in 15 days, in daily stages of just under 200 miles, the average speed never to be less than 15½ miles an hour. The start each day might take place as early as 5 a.m., and the car had to arrive in the last control not later than 7 p.m. Repairs of parts and tyres had to be done in the running time. The car arriving later than the prescribed time to lose the match.

The journey commenced on July 12th, and the first 1,000 kiloms. of the route, through Boulogne, Sedan, to Vesoul, were without incident, except that a fog caused both drivers to lose their way. The average pace of the Siddeley car was 22 miles an hour, including the climb over the Plombières Ridge. The De Dietrich was slightly faster. On the fourth day's run to Aix-les-Bains (330 kiloms.), the Siddeley had tyre troubles, but both cars reached Aix in good time. This day's run was through some of the most beautiful scenery, but the Dauphinois Hills were severe on tyres and brakes. The next day the competitors tackled the climb of 6,000 feet by the Mont Cenis Pass, with its winding road and hair-pin corners. The ascent was accomplished safely, though the water in the radiators boiled furiously. The drivers and passengers (a full load was carried) were able to witness the Mont Cenis Automobile Climb, at which the Queen of Italy was present. The end of the day's trip was at Embrun. The worst part of the journey was the next day's run to St. Raphael by the Col d'Allos. The road was very steep and rough, the weather terribly hot, and the corners so bad that oftentimes the cars had to be got round by use of the reverse. The drop to Puget Theniers was especially exciting, as both drivers took risks owing to a misunderstanding as to their being behind their scheduled time.

On July 18th and 19th, the journey was continued to Beziers and Luchon in the Pyrenees. Owing to a landslip, a different route from that sketched out had to be taken. The roads were bad, and punctures were frequent, whilst the heat was terrific. Added to which, the dirt-choked radiator of the Siddeley gave trouble through overheating. So done up was everyone, that on reaching Luchon, it was mutually agreed to take a day's rest and cut out the route to Bayonne, going on to Bordeaux direct on July 21st.

After this, good headway was made each day—on July 22nd from Bordeaux to Nantes, on July 23rd from Nantes to Brest, on July 24th from Brest to Granville, with a final two days' run to Paris *via* Trouville.

M. Meyan had the advantage of a faster car, so that in case of having to effect any repairs on the road, he had more time to get to his destination in the prescribed period. Despite this handicap, the Siddeley car proved its reliability and did not drop a single point. Mr. Graham White was accompanied by Mr. V. G. New as reserve driver, the mechanic Martin (who went through the 5,000 miles Siddeley trial early in the year), and an observer appointed by M. Meyan.

The total times published for the journeying of the two cars respectively over the 4,461 kiloms. is, the Siddeley car, 119h. 4m.; and M. Meyan's De Dietrich, 100h. 30m. The success of the match is considered by Mons. Meyan to be so great that he has announced his intention of carrying out his promise of arranging for a competition in 1906, and subsequent years, on a much more extended scale, in which, instead of only two participants, owners generally will be invited to join. For next year's event, No. 1 car entered is one by Mr. Siddeley, and in drawing up the rules for future events these will be modified to provide for the experience gained in the recent event.

RACES are to be held, it is announced, on the sands at Mablethorpe on Saturday, August 19th, under the auspices of the Lincolnshire A.C., in response to the invitation of the Mablethorpe Amusements Committee. Some valuable prizes are to be offered, and a firm and clean course of 1,000 yards, it is stated, is available on the sands.

BEACH races are also, it is proposed, to be organised at Lytham in September. Support has been promised in the district by Squire Clifton, and Mr. Huntley Walker is reported to have given it as his opinion that the track along the Esplanade is an ideal one. A public meeting is being convened for Thursday of next week to discuss the details of the proposals.

FRENCH COMMERCIAL VEHICLE TRIALS.—A type of wagon entered to comply with the military requirements. No. 88, the Latil wagon.

First heat of the Starting and Stopping Race.

Coventry Gymkhana.—The Midland A.C. held a very successful gymkhana at Coventry, last Saturday, in aid of the local hospital. The arrangements were in the hands of Messrs. C. Vernon Pugh, T. H. Ryland, Alfred Herbert, and other prominent Midland motorists, and the meeting was attended by 25 cars, including entries from London, amongst these being a 30-h.p. Ariel, driven by Miss Godwin, and an 18-h.p. Mercedes, driven by Mr. H. du Cros, Jun. The events included balancing, driving from and returning to the coach-house, starting and

Ladies' Passenger Race.

Bogus Speed-Limit Boards.—An amusing example of the length to which local authorities will exceed their powers, especially when inspired by motorphobia—a painful disease very prevalent amongst these bodies—was recently discovered in Denbighshire. Without having obtained any authority from the Local Government Board, the Denbigh County Council had had a notice board erected on a road near Wrexham giving all and sundry to understand that motor cars were not permitted to proceed at more than 10 miles an hour.

Balancing. Mr. Frederic Coleman with his White Steam Car on the platform.

stopping, and ladies passenger race. Although the weather was rather threatening, the rain fortunately held off during the afternoon, and there was a very large and fashionable gathering of spectators. A feature of the afternoon was provided by the Wolseley Gordon-Bennett racer, with which an exhibition of speed-driving was given in the intervals. The Daimler cars, which performed so well at Blackpool, were also present, and ran round.

Another aspirant for the honour of the first prize.

The local correspondent of the Motor Union wrote to the secretary of that body to enquire whether the Local Government Board had ordained the 10-mile limit in the district, and was, of course, informed that nothing of the kind had taken place. The result has been that the County Council has now removed their 10-mile limit board and replaced it by a danger post! It is to be hoped that anyone observing similar notices throughout the country will take steps to test their legality.

Messrs. E. W. Kennard, H. Du Cros, junior, and W. Du Cros, are critical spectators.

The Gordon-Bennett Wolseley racer is a source of much interest and admiration.

COVENTRY GYMKHANA.

CLUBS AND ASSOCIATIONS.

MOTOR GYMKHANA AT BOURNE END BY THE BRITISH MOTOR BOAT CLUB.—View at the landing stage, the boat on the left being Capt. Owen's "Thrasher."

Motor Boat Club.—A motor boat gymkhana was organised by the club at Bourne End, but, unfortunately, for one reason and another, only two boats actually took part in the four contests which were down on the programme, these being Mr. Desnoss's Lookout, and Captain Owen's big launch, Thrasher. Mrs. Desnoss was the winner of the Serpentine event against Miss Bianchi. The Taking Up and Landing Passengers Race was secured by Mr. E. Carr, who steered Captain Owen's Thrasher, the Serpentine Stern First event went to Mr. Desnoss, and Captain Owen was the winner in the Obstacle Race. It is only to be regretted that a few of the splendid motor craft which passed up and down the river during the running of the events could not have been induced to join in what should have been a most successful and enjoyable afternoon's amusement.

The Automobile Mutual Protection Association.—On Tuesday, at the last meeting of the Council before the holidays, the president, the Earl of Shrewsbury and Talbot, occupied the chair. It was resolved that the Report on "Dustless Roads," presented by Mr. Douglas Mackenzie, the assistant secretary, should be re-arranged and circulated to the Press at an early date. A donation of five guineas was voted to the Roads Improvement Association in connection with the intended laying of an experimental strip of dustless road materials in Hyde Park.

East Surrey A.C.—The August run of the club will be held on Saturday afternoon, August 12th. The meet will be held at the Hotel, Leith Hill. Tea from 4.30 to 5.30.

Leicester A.C.—A specially interesting outing took place amongst the members of this club on Saturday last, when a visit was paid to the Abbey of Mount St. Bernard, near Coalville, arrangements having been made at this point to meet the Derby club. A sprinkling of rain had to a certain extent mitigated the dust nuisance, and the occupants of the fifteen cars which made the journey, either by Groby and Markfield, or via Loughborough, were well rewarded for joining in the outing. The Derby motorists had, however, an unpleasant experience when passing through Shepshed where some dear, sweet, unsophisticated little children, by way of amusing themselves in their usual playground—the road—showered a perfect volley of stones at the occupants of the cars when passing, a pastime which has no doubt been quite legitimatised in consequence of the teachings of such lights as Canon Greenwell and Sir Ralph Payne Galwey. The monastery was visited, and, under the guidance of Father Jerome, the male portion of the party were permitted to visit the Abbey itself, the ladies, however, being rigidly excluded from all parts of the building, except the chapel and the bazaar. Subsequently, tea was taken at High Tor Farm, prior to a return on the homeward journey at 8 o'clock.

Sheffield A.C.—In spite of the rain, which somewhat marred the pleasure of the participants towards the latter part of the programme, the gymkhana organised by the Sheffield Club at the Niagara Grounds, Wadsley Bridge, last week, was voted a decided success. Although the function was more of a social gathering for the members of the club and their friends, a good outside attendance was brought together in addition. Fortunately, the rain held off sufficiently to allow most of the events to be successfully concluded, although the final contest was run off amid a downpour. The events were judged by Mr. Alderman Clegg, and the prizes were distributed to the successful competitors by Mrs. Wilkinson. The timekeepers were Messrs. G. D. Flather and J. R. Wade, and the committee, who acted as stewards, were Messrs. R. Brown, C. A. Clarke, J. E. Evans, T. H. Firth, A. F. Fletcher, M. E. H. Hill, P. R. Thompson, J. R. Wade, W. Watts, and Dr. Thorne, with Mr. Fred B. Cawood as hon. secretary. The programme was considerably enhanced by the performance during the afternoon of an excellent selection of music by the band of the 2nd King's Own Yorkshire Light Infantry. The programme consisted of the usual items in an entertainment of this character, the Bending Race appearing to give particular satisfaction to the visitors, his being won in the final by Mr. Schwab (6-h.p. De Dion) in 34½ secs. Keen contests were witnessed throughout, particularly in the Starting and Stopping Race, which fell to Mr. A. S. Fawcett. The Lady Passenger Race was won by Mr. Schwab, Mr. T. H. Firth (12-h.p. Wolseley) securing first place in Tilting at the Ring. The 3 mins. allowed for balancing a car on the rocking platform was too short a time for the majority of the competitors, Mr. Schwab again scoring in this event, and being the only one who successfully accomplished the feat. The Crawling Race was a thing to behold, the ultimate winner being Mr. O'Connor Parsons (12-h.p. Swift) who managed to eat up 5m. 43s. in covering the 100 yards. Other events were a Reversing Race, in which Mr. W. H. Dixon (16-h.p. Clement) was successful, a Motor Coach-house Race, which fell to Mr. James Barber (20-h.p. Belsize), and a Lady Passengers' Hockey Match, secured by Mr. T. H. Firth. An interesting competition for members' drivers, for taking off and putting on a tyre, was divided between the chauffeurs of Mrs. Wilkinson, Messrs. Coupe and Firth.

Society of Motor Manufacturers and Traders.—At the first ballot for space and positions at Olympia, in November next, the number of stands dealt with was 165, including, besides motor cars, commercial vehicles, motor boats, accessories, carriage work, tyres and machinery. In addition to the best known British manufacturers, representatives of many famous Continental and American firms were present. The total amount of space allotted was about 100,000 square feet, which is about three-quarters of the space available. There are numerous applications (rather too numerous, in fact) for the remaining space, for which a ballot will shortly be arranged.

IN CUBA ON A WHITE STEAM CAR.

THE Lancashire County Council are about to expend £500 in dust-laying experiments.

At a recent meeting of the Bradford Technical College, the Mayor, in the course of an address, said that he and Professor Charnock had made up their minds that in future they would endeavour to provide instruction in motor car driving and construction for the members of the College.

THE line of motor'buses running between Birmingham and Harborne has, we learn, been withdrawn, the Company reverting to horse-drawn vehicles. The reason given by those responsible is that the wear and tear on the rubber tyres is too great to allow of the motors being run at a profit, the roads which the vehicles have to traverse being exceptionally severe on tyres.

IN a recent case in which a motor car driver was arraigned before him for being drunk when in charge of a car, Mr. Horace Smith commented on the absurdity of the position which, while enabling him to fine automobilists up to £10 and £20 for quite trivial offences against the Act, only enabled him to inflict a penalty of 40s. in the case of such a serious offence as this.

A GENEROUS offer has been made to the London County Council by Mr. Bischoffsheim to provide an electric motor ambulance for use in the Metropolis. Mr. Bischoffsheim's philanthropy was called into play in this particular direction by witnessing an accident, many years ago, in which a painter fell from a scaffold on to the pavement. Mr. Bischoffsheim was disgusted at the crude and barbarous manner in which the unfortunate man was bundled into a cab by a policeman. He has never forgotten the incident, and now, when the electromobile provides an ideal form of ambulance, he generously provides one for use in London.

A PLEASING contrast to the travesty of justice, on which we comment editorially this week, is provided by some proceedings which took place before the Epsom Bench, a Court which has been generally distinguished by fairness and accurate weighing of the evidence put before it. Mr. G. C. Smith, of 84, Vanburgh Park, Blackheath, was summoned on the usual charge of driving a motor car at a speed exceeding 20 miles an hour—to wit, 26 miles 828 yards—a piece of elaborate calculation which shows that the general educative effect of the automobile movement is spreading even to the police, who two years ago would certainly not have been able to get out a calculation of this kind. There was the usual hard swearing, and attempts to keep the stop watches with which the police were provided from being examined. It so happened, however, that Mr. Smith's car was furnished with one of the speed indicators manufactured by his namesake, the celebrated watch and chronometer makers, of the Strand, and he was able to produce evidence that this instrument, of whose reliability the magistrates were convinced, had never indicated a speed in excess of 18 miles an hour. The result was that the case was dismissed, a valuable testimonial both to speed indicators and the good sense of the Epsom magistrates.

Field-Marshal Lord Roberts's motor car. The vehicle is an 18-h.p. Napier carriage, specially designed for Lord Roberts, with Limousine top and canopy, which is easily removable. Earl Roberts joined the ranks of automobilists some months ago.

MOTOR CYCLING.

Irish Motor Cycle Union, Speed Trials at Portmarnock.—On Saturday afternoon the members of the Union held the third of the series of speed trials at Portmarnock. The programme was made up of a mile novice's race confined to members, and a ten miles handicap for a silver cup presented by Mr. Hampton Shaw, C.E., one of the vice-presidents of the Union. As on a former occasion the mile handicap was divided into heats, according to the horse-power of the machines, and a handicap framed on the ground for the final. A regrettable feature occurred in connection with the meeting, inasmuch as exception was taken to the machines driven by Messrs. C. B. Franklin and A. E. Bannister, and after consultation it was decided to submit the machines for examination to Messrs. J. MacCabe, B.E.T.C.D., and Vincent Mayne. After investigation it was announced that Mr. Franklin's mount was slightly under the measurement stated on the entry and passed at once, but the body of the cylinder of Mr. Bannister's Minerva was four millimetres over the measurement, and under the circumstance the judges referred the matter to the committee, and no decision was arrived at as to the result of the Shaw Cup.

The following were the results:—

One Mile Handicap, Novice.

1. S. Black...	2-h.p. Triumph...	25 secs.
2. R. Howison	2½-h.p. F. N.	10 secs.
3. G. Metcalfe	3-h.p. Centaur	15 secs.

Won by 4 secs. ; 7 secs. between second and third. Time, 2 min. 1 sec.

One Mile Handicap (Members). For machines up to but not over 3½-h.p. Heats decided according to h.p., and handicap framed for final heat.

		Handicap.	Heat times.
		secs.	min. secs.
1. A. E. Bannister	Minerva	25	1 50
2. J. G. Drury	Triumph	10	1 42
3. C. B. Franklin	Oriel	15	walk over.

Won by 1 sec. ; 4 secs. between second and third. Time, 1 min. 54 secs.

Ten Miles Members' Handicap (Shaw Cup).

1. A. E. Bannister	2-h.p. Minerva	5 min. 0 secs.
2. C. B. Franklin	2½-h.p. F.N.	scratch.
3. A. Summers	3-h.p. Triumph	1 min. 40 secs.

Won a good race by 6 secs. ; 5 secs. between second and third. Winner's time, 20 min. 38½ secs.

Brighton Race Meeting—In our report of the Brighton meeting, by a slip, we gave the horse-power of Mr. G. A. Barnes's machine, which he rode against Cissac's 12-h.p. motor bicycle and secured second place, as 10-h.p. This should have been 4-h.p.

BLACKPOOL MOTOR MEETING.—The ambulance Wolseley Car which patrolled the side of the course during the whole meeting.

THE "Vanguard" line of motor omnibuses, which has been running so successfully from Brondesbury to the Law Courts, is now being diverted at Wellington Street, Strand, and extended to the Elephant and Castle as the other end of the route. Already twenty-six of these cars are running, and it looks therefore, with Messrs. Tillings' buses in full swing, as if the south of London were securing more than its fair share of the increased facilities for getting about town.

SINCE 1902, the Roads Improvements Association has consistently and persistently advocated the adoption of a traffic regulation in the Metropolis, which should compel all slow-moving traffic to keep as close as possible to the kerb. In the City there is a by-law to this effect, which the police, as far as possible, enforce, but in the other districts of the Metropolis the police have no power. It is therefore satisfactory to find that the recent Royal Commission on London traffic advocates a by-law to this effect, and state it as their opinion that its adoption would do much to diminish the congestion of traffic. As they admit, its effectiveness would be largely diminished by the great number of vehicles permitted to stand at the sides of streets, practically as long as they choose, and it would therefore appear that there is also need of an ordinance limiting the length of time during which stationary vehicles are thus permitted to impede the traffic. In any case the unloading of goods in this way ought not, under any circumstances, to be permitted in important thoroughfares during the busy hours of the day.

WE learn from the neighbourhood of Morecambe Bay of an exciting adventure which occurred to a Carnforth motorist,

Mr. Barton. When crossing the sands on Saturday afternoon last, where they were apparently firm and hard, he ran his car into a quicksand, from which it was only with difficulty extricated by a posse of some forty volunteers, who happened, most fortunately for Mr. Barton, to be in the neighbourhood. To make the story complete, we ought ultimately to learn that the stretch of sand in question was included in a police trap, and that, in spite of Mr. Barton's immersion in the quicksand he has been summoned and convicted for travelling through it at precisely 30 miles an hour by the stop-watch!

THE executive of that egregious organisation, the Highways Protection League, have drafted a programme of changes which they would like in the Motor Car Act. Amongst the things that the highway protectors desire to see introduced are the following:—1. A reduction of speed. 2. Easier means of ascertaining the identity of owners. 3. Stringent regulations to prevent blinding headlights, dust, and noise. 4. Wider discretion to local authorities for regulating motor traffic.

A Sir James Ferguson, speaking at a recent meeting of the League, declared that "It has come to be said that you can kill a child at the risk of four months' imprisonment." A further suggestion was made that magistrates should be empowered to impound motor cars. We should like to know who this statement has been made by. Is it by Sir James Ferguson or his friends, or has it really been made at all? If it has, we can only say, as is often done across the floor of the House of Commons, "Name!"

A SPECIAL motor car has been provided for the use of the Osborne House Convalescent Home for Officers, and has been approved by His Majesty King Edward.

"Enigmarelle," the mechanical man, on a 9-h.p. Oldsmobile seeking refuge in Messrs. Charles Jarrott and Letts' premises in Great Marlborough Street after appearing at the Police Court to answer a summons for obstruction. We referred last week to this incident.

NEW COMPANIES REGISTERED.

Automobile Guarantee Syndicate (Limited).—Capital, £3,000 in £1 shares.

Blackpool Motor Garage and General Engineering Company (Limited), Clifton Chambers, West Street, Blackpool.—Capital, £20,000 in £1 shares (10,000 six per cent. cumulative preference). Object, to acquire the business carried on by R. Riley, of Abingdon Street and Back Eaves Street, Blackpool, and the assets of the Blackpool Engineering Works (Limited), of New Road, Blackpool. First directors, the Hon. Arthur C. Ponsonby, R. Riley, R. B. Mather, T. Bickerstaffe, J. Sharp, and J. Heap, J.P.

City and Suburban Motor-Omnibus Company (Limited).—Capital, £10,000 in 9,000 ordinary shares of £1 each and 8,000 deferred shares of 2s. 6d. each. First directors, A. L. Caporn, W. Harfey, and D. Morris.

Motor Pneumatic Tyre Company (Limited).—Capital, £150,000 in £1 shares.

Motor Transit Trust (Limited), 70, Cornhill, E.C.—Capital, £5,100 in 5,000 "A" shares of £1 each and 2,000 "B" shares of 1s. each.

Peterborough Motor-Bus Company, (Limited), 4, Cross Street, Peterborough.—Capital, £5,000 in £1 shares.

Quick Car Company (Limited), 69, Victoria Street, Westminster.—Capital, £20,000 in £1 shares (10,000 preference).

Southend-on-Sea and District Motor-Omnibus Company (Limited), 105, Broadway High Street, Southend-on-Sea.—Capital, £10,000 in £1 shares. First directors, J. Sellar (chairman), C. Cripps (managing director), F. Davey, W. J. Ellis, G. Jackaman, F. Knight, W. Neil, and J. Pettitt.

The Scotia Motor and Engineering Company (Limited), 194, St. Vincent Street, Glasgow.—Capital, £20,000 in £1 shares.

Vining-Hallett Motor Manufacturing Company (Limited), Grosvenor Road, West Ealing. Capital, £15,000 in £1 shares. R. W. Vining is the first managing director.

West (Limited).—Capital, £15,000 in £1 shares (5,000 preference). Object, to acquire (1) the undertaking of the West London Motor Company, Limited, and (2) the undertaking of E. J. West and Co., Limited. First directors, Colonel S. M. Jupp (chairman), S. D. Begbie, E. J. West, and B. M. Tomlinson.

COMMERCIAL POINTS.

IN connection with the recent Brighton Speed Trials several of the best times were made by vehicles using Pratt's Motor Spirit as fuel. Amongst these were the following, all best times:—

Standing Kilometre.—Mr. A. Lee Guinness, on his 100-h.p. Darracq, in 35½ secs.; Mr. H. Rignold, on his 12-h.p. Peugeot motor cycle, in 36½ secs.

Flying Kilometre.—M. H. Cissac, on a 12-h.p. Peugeot motor cycle, in 26 secs.

Flying Mile.—Mr. Rignold, on a 12-h.p. Peugeot, in 46½ secs.

Standing Mile.—M. Cissac reduced the standing mile record to 53½ secs.

THROUGH one of their Continental agents, Messrs. Charles Jarrott and Lettis, Limited, learn that in the Ostend races the Oldsmobile won the following prizes:—Three gold medals, one silver medal, and one bronze medal, the second prize for decorated cars, and one special mention for the best coachwork.

THE business of the "Otto-Bennett" Motor Company, until recently carried on by Messrs. Otto and Bennett, at 8, Snow Hill, E.C., has been acquired by Mr. S. D. Rose, A.M.I.Mech.E., who will continue trading at the same address under the title of the "Otto-Bennett" Motor and Engineering Company. The new firm is specialising in the well known and deservedly popular Sée bands, and their present facilities enable them to deliver promptly. Sée-Continental non-skid tyres are also one of their leading lines.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

19073. 5th September, 1904. Improvements in Steam Generators for Motor Vehicles. Elijah Perkins, Rose Bank, Moorton Avenue, Levenshulme, and John B. Rowcliffe, Mersey Bank, Didsbury, Manchester. This invention relates to improvements in steam generators for heavy motor-vehicle, the object being an improved construction of generator in which inequality of expansion of the parts is avoided and greater heating surface is obtained. There is one drawing, a sec-

tion of the shell by an angular bend. From the second plate, *g*, rises an inner enlarged shell, *j*, the two enlarged shells being secured together at their upper ends by a channelled ring, *k*. Located between the two enlarged shells and in line with or a little above the vertical combustion tubes, *h*, is arranged a number of inclined combustion tubes, *l*, adapted to conduct the gases rising up the vertical tubes back again in a downward direction towards the smoke box or combustion-chamber, *m*, which is arranged to

plate at the apex is flanged somewhat to fit into the tube. The hole in the outer plate may be stopped up by a cap, *q*. July 13th, 1905.

12279. 30th May, 1904. Improvements in and relating to Friction Clutches and similar Devices. Frank Baker, 5, Lea Park, Blackheath. This invention relates to friction clutches, and has for its object to provide a friction clutch having a relatively greater area of frictional surface. The invention is also applicable to brakes where the respective members have the reverse functions to those they have when used in a clutch proper. There are four figures, of which Fig. 1 is a sectional elevation. Two discs, *a* and *b*, are mounted respectively upon the driving and driven shafts, *c* and *d*, which are oppositely disposed. Upon each of these discs, *a* and *b*, are mounted two, three, or more circumferential series of segmental brake blocks, *e*, *f*, perpendicular to the inner face of the disc, concentric with the shaft, *c* or *d*, upon which the disc is mounted, each series being thus in circumferential line, but having spaces between the respective blocks. Each of the segmental blocks or rings is mounted on a pin or bolt, *i*, the rings having lugs, *h*, passing through holes, *h*, of a corresponding shape provided in the discs to secure them. Three such shoulders or lugs are provided and two holes in the discs. The discs on the pins, *i*, passing through holes are loosely mounted in lugs, *h*, upon the clutch discs, the amount of play allowed being such as to permit the segmental blocks or rings of the respective series to be brought into frictional contact one with the other. The pins have spiral springs mounted upon them interposed between the lugs or shoulders, *h*. Two segmental blocks, *k*, are provided with a corresponding number of sets of toggle levers, *m*, lying around the segmental rings, *e*, *f*. The continuous ends of the segmental blocks, *k*, are connected together by means of a pin, *n*, to which a member, *m*, of one of the set of toggle levers, *m*, is connected. Each set of toggle levers consists of two members, *m*, and two members, *m*; these members, *m*, each have one end connected to a segmental block, *k*, the opposite end being connected to one or other of the two toggle links, *m*, connected to an arm, *o*, on the sliding operating sleeve. Each of the members, *m*, passes through holes, *p*, provided in the disc, *a*. In operation as the sleeve approaches the clutch the toggle levers will separate. July 13th, 1905.

tion. A cylindrical or other shaped furnace, *a*, is adapted to be fed with fuel either from the side of the furnace, through a feeding door, *b*, or from the top, the furnace being surrounded by an outer shell, *c*, with a space, *d*, between the two for allowing circulation of water. The top plate, *e*, of the furnace is provided with a central fuel-feeding tube, *f*, the upper end of which is supported by a second plate, *g*, between which and the top of the furnace and surrounding the central feeding tube are a number of combustion tubes, *h*. Attached to the outer cylindrical shell, *c*, is a second shell, *i*, joining the smaller

surround the largest of the enlarged shells, *i*. Both the vertical tubes and the inclined tubes are submerged in the water when the boiler is working, so that a greatly enlarged evaporative surface is obtained. The inner of the enlarged boiler shells, *j*, forms an annular chamber, *n*, into which the products of combustion from the vertical tubes, *h*, enter. This chamber is closed by a loosely fitting lid, consisting of two conical plates, *o*. The outer plate rests on the top edge of the cylindrical shell, *j*, or on an angle ring, *p*. The inner plate *o* at the apex passes over the central feeding tube, *f*, whilst the external

Nearly all the back numbers can still be obtained separately by application to the Publishers. Many of the back numbers are raised in price; and all other copies beyond a month old are *ad. each*. Bound volumes can be had at the following prices:—

VOL. I ...	PRICE £5 5s.	VOL. VI (6 Monthly Nos.)	£3 3s.
VOL. II ...	£1 1s.	VOL. VII ...	£6 6s.
VOL. III ...	£1 1s.	VOL. VIII ...	£7 7s.
VOL. IV ...	£1 1s.	VOL. IX ...	£2 12s. 6d.
VOL. V ...	£1 1s.		

COVERS FOR BINDING VOLUMES.

Price 1s. 6d.; Post free, 1s. 9d. Can be obtained through the usual Agents, or direct from the Publishers.

Cheques and Post Office Orders should be made payable to F. KING AND CO., LIMITED, 44, St. Martin's Lane, W.C., and crossed London and County Bank; otherwise no responsibility will be accepted.

When any difficulty is experienced in procuring the Journal from local news-vendors, intending subscribers can obtain each issue direct from the Publishing Office, by forwarding remittance as above.

NOTICE.—Advertisement instructions should reach the office, 44, St. Martin's Lane, W.C., by first post, Wednesday. The latest time for receiving small alterations for Advertisements is 12 noon, Wednesday. No alterations can be made after that hour.

PASSING EVENTS.

The Personality of the Commission.

THERE will be general satisfaction with the personality of the Commission which has been appointed to enquire into and report upon the working of the Motor Car Acts. The members appointed are the following :—

Viscount Selby, late Speaker of the House of Commons, chairman ;
The Marquis of Winchester ;
Mr. E. R. Henry, Chief Commissioner of Police ;
Sir William Forwood, chairman of the Liverpool Quarter Sessions, and a director of the Cunard Steamship Company ;
Mr. W. J. Mure, an Edinburgh advocate ;
Mr. Munro, representative of the Local Government Board ; and
A representative of Ireland.

The late Speaker of the House of Commons has been so long and favourably known to the public by his family name, that possibly some readers may fail to recognise him under his title in the Peerage, but throughout his long record in Parliament as Mr. Gully, he has become almost identified with the idea of absolute impartiality, and as sound and commonsense judgment on all questions submitted to him as distinguishes any judge upon the bench. Mr. Munro has been favourably known to motorists in connection with the administration of the present Act, having held office as Assistant Secretary to the Local Government Board for a considerable time, during which period he has had to hold enquiries on various applications for the imposition of the 10 mile limit, in all of which he distinguished himself by the strictest impartiality and good sense. On the whole, without being a pronounced motorist, Mr. Munro may be looked upon as favourable to the automobile cause. Of the opinions of the Marquis of Winchester and Sir William Forwood, who are Chairmen of Quarter Sessions in the south and north of the country respectively, little apparently is known—but they are Chairmen of Quarter Sessions. In the chairmanship of Viscount Selby, however, we have the most absolute guarantee for the impartiality in the proceedings which the Commission will conduct, and the practical certainty that its report will be in accord with the evidence put before it.

The Duty of Everybody.

It is superfluous to point out the enormous influence which the deliberations of the Commission are practically certain to exercise on future automobile legislation in this country, and, in consequence, on the future of the automobile movement. However satisfactory a Commission may be, however determined to deal fairly and justly with the questions which have been referred to it, it can only take cognisance of this evidence, and it is therefore of the utmost importance that the automobile case should be put strongly and clearly and eloquently before it. No amount of trouble or expense should be regarded as too great to ensure this being done, and we look to the Automobile Club (we must admit with much confidence) to see that this is effected. How far the Commission will be willing to hear individuals not representing organisations we do not at present know, and its action in this respect will probably be determined after its first sittings. But it is just as well, since prominent automobilists may quite possibly be heard individually, that everyone of prominence connected with the movement,

whether amateurs or manufacturers, should be ready prepared with a convincing case and an outline of the evidence which they will be willing to tender. Even if they are not ultimately heard by the Commission, such facts and evidence as they may collect will probably prove of the greatest value to the Automobile Club. Of one thing everybody may be practically certain. Unless something amounting to a political upheaval takes place in the meantime, future legislation will be based on the committee's report, and, considering the personality of the Commission, we may feel confident that the report will be in accordance with the evidence tendered. It is for the Automobile Club and automobilists throughout the country to do their duty.

The Automobile Club Already Moving.

IN fact the Automobile Club, with commendable promptitude, has already taken action in the matter, and has appointed a sub-committee to go into the whole question, and prepare the automobilist's case for presentation to the Commission. For the sinews of war, too, preparation is being made, private car owners having already subscribed some £300 to what is being termed the Legislative Defence Fund of the Motor Union, and the Daimler Company have also made a munificent donation of £250. The Legislative Defence Fund, it should be pointed out, is to be devoted entirely to placing the case of the automobile movement before the Commission. At the same time the club has instructed the head of its legal department to draw up a case for the assistance of the special sub-committee appointed. The propaganda which the club and the Motor Union are putting forward should have the effect of placing the sub-committee, referred to above, in possession of a splendid amount of material for making up their case. Already some sixty clubs have been written to on the subject, and requested to provide any information which they may consider will be of use, and their replies will no doubt form a useful nucleus of information and suggestions.

Proposals for Future Legislation.

It must be borne in mind that while the Commission will investigate the past working of the existing Motor Car Acts, it will also be employed in elaborating proposals for future ways in which the existing statutes can be improved, and from this point of view the opinions of the local clubs have been specially invited in regard to a few points on which alteration in the existing law is suggested. These are :—

1. *The speed limit*, i.e., the abolition of an arbitrary limit, and the reliance on consideration for the general safety of the public as governing the action of drivers.
2. *Endorsement of licences*, i.e., whether this form of punishment should not be restricted to serious offences only.
3. *The right of appeal* in any motor car conviction, irrespective of the heaviness of the punishment inflicted.
4. *Notice of prosecution*, i.e., that the alleged offender should be notified within seven days of intended prosecution.
5. *Fines and fees* inflicted to be paid into the Imperial exchequer.
6. *The use of the horn* to be entirely at the discretion of the driver, and not obligatory.
7. The present ambiguity about makers' marks to be removed.

The opinions of local clubs and individuals on these points will make a good beginning, but, needless to say, there are hosts of others, and there is the big department of injustice and hardship resulting from the administration of particular sections or phrases of the

existing acts. Anybody who is acquainted with instances of the kind (and there must be huge numbers who are) would undoubtedly do well to place them before the sub-committee of the Automobile Club, so that a selection may be made for presentation to the Commission.

♦ ♦ ♦

Gordon-Bennett Cup Race, 1906.

"THE committee of the Automobile Club of Great Britain and Ireland have decided not to challenge for the above."

By the above resolution the committee of the Automobile Club have signified their determination not to challenge in 1906 for the Gordon-Bennett Race. On the whole we are inclined to think they are wise in coming to this decision. There is every reason to believe that automobile engineers and constructors of practical touring cars have learned from high-speed racing (at any rate with existing types of racing car) practically all that there is to be learned. Should the British club not have taken this decision, but have decided to challenge for the Cup next year, their action would mean that some leading British manufacturers would once again be put to enormous trouble and expense, for they would feel it incumbent upon them to support the honour of their country as strenuously as they have regularly done in the past. At the same time, it is open to question whether either they or the automobile movement would receive value for the money spent. We believe it to be very generally felt by all those best qualified to form an opinion, that the expenditure which would be involved by the participation of the A.C.G.B.I. in another year's Gordon-Bennett, would, at the present stage of the development of the industry, be much better and more wisely devoted by the Club and by the manufacturers to directly developing the tourist car. Apparently, in fact, it is better policy at present to support the Tourist Trophy than the Gordon-Bennett race."

♦ ♦ ♦

The Tourist Trophy a Subject for Provincial Clubs.

ALL who read the accounts which we regularly publish of the proceedings of provincial clubs will presumably have come to the conclusion that the committees of these clubs must often be rather in a fix for some class of event in which their members may take part, and which will interest and appeal to both those concerned as participants and those who look on. They have had a long bout of hill-climbs, and hill-climbs were once amusing and instructive, but, as we have recently pointed out, that happy day has vanished into the "Ewigkeit," and hill-climbs at the present moment are not instructive, are seldom amusing, and do not teach either the participant or spectators anything that they did not know before. Having weighed the hill-climb in the balance, therefore, and found it wanting, the provincial clubs have now betaken themselves to the gymkhana. In fact, that appears to be the only form of competition that still provides amusement, and puts a premium on skill, and so introduces that personal element into prize-winning competitions which gives what provincial clubs want. To provincial club committees, therefore, at their wits' ends to devise new competitions which will prove attractive to their members, events based on the same general lines as the Tourist Trophy may quite conceivably come as a message and revelation from on high. Last week we pointed out that the amateur would find a

good deal of instruction and interest attaching to driving his car against fuel consumption, that doing so would teach him skill in car management, and would enable him to find out a number of things that he did not know before. Competitions arranged on this basis would have all these advantages for organisers of events in the provinces, and would in addition present a very great advantage by enabling them to arrange interesting and amusing competitions, which would supplement the gymkhana and replace the hill-climb by a useful type of competition, in which their members would soon become enthusiastically interested, and which would provide a liberal education in the real principles of motor-car driving and car management.

♦ ♦ ♦

The Smoky Exhaust Nuisance.

ON several occasions in the past we have referred to the considerable, and we fear we must add growing, nuisance of the emission of smoky exhaust by tourist cars both in towns and on country roads. We have pointed out what a serious matter this really is, particularly at the present moment, as—more than anything else except the dust nuisance—it tends to create and foster hostility to the movement. As we said last week, "it is a serious source of annoyance to other road users, and the fertile cause of irritation and hostility to motor cars second only to the dust nuisance, and as it is avoidable it is inexcusable." We need hardly add, therefore, that we are gratified to receive from the Secretary of the Automobile Club a circular which he has dispatched to the automobile press and the automobile world generally drawing attention to the circumstance that the committee of the club has for some time past been taking steps to try and abate the smoke nuisance, being of opinion that there is no excuse for anyone to regularly permit smoke to pour out with the exhaust from his car.

♦ ♦ ♦

A Matter for Carefulness and Adjustment.

As is pointed out by the Club Secretary's circular, the emission of smoky exhaust is (considering the high degree of perfection to which the engines of petrol cars have now been brought), in practically every case, due to want of thought and attention to details. It is as well to make use of the present opportunity for dealing with this very important subject, as there are no doubt a large number of private car owners who, while the last people in the world to wish to poison the atmosphere for other road users in this unpleasant way, may fail to realise how absolutely the trouble can be got rid of by a little careful consideration of first principles.

The whole cause, it is perhaps superfluous to observe, of smoky exhaust is superfluity of lubricating oil in the cylinders. For lubricating oil to discharge its functions properly, it must be practically incombustible, that is to say, its flash point must be so enormously high that it will not burn in the cylinders. If, therefore, there is too much of it present, it comes out as an unburnt or partially burnt, evil-smelling smoke with the exhaust gases. If the lubrication is properly managed, that is to say, if just enough oil is used to lubricate the pistons, and not too much, the exhaust will be smokeless. To get rid of the smoke, therefore, careful consideration or adjustments are necessary, and they are all that is necessary on a well-designed vehicle.

Two Ways of Getting Rid of the Trouble.

PERHAPS the best method of getting over the difficulty is to see that the engine is fitted with one of the existing lubricating systems by which the lubricating oil is measured out in doses of the required amount, and is delivered regularly by a forced feed to the cylinders. It is, of course, necessary in this case to adjust the feed in the first instance until the car runs smokelessly, and after this adjustment has been made the driver can feel certain that there will be no smoke.

In cases where ordinary splash lubrication is relied on, however, the level of the oil in the crank-chamber must be carefully adjusted, and also the rate at which the lubricator feeds fresh oil into it. When this is done properly, smoky exhaust will disappear. Perhaps the chief practical difficulty to be encountered, with any gravity feed device, is that the viscosity or "thickness" of lubricating oil varies considerably with the temperature, and that, therefore, what is a suitable adjustment for a drip feed on a cold day will not be a proper adjustment for a hot day; a certain amount of adjustment is accordingly necessary from time to time, even though the same grade of oil is always employed. It is this which gives to the systems of lubricating, in which the oil is measured out and fed positively, their superiority.

An Evidence of Progress.

It must not be forgotten that the fact that cars can continue to run with smoky exhaust is an evidence of other improvements having been made in modern petrol engines. With the old types of electric ignition, in use some years ago, a superfluity of lubricating oil, such as would produce smoke in the exhaust, would soon have brought matters to a standstill, or seriously impaired the speed attained by effecting the spark on which the ignition of the charges depends. Improvements in ignition have, however, now made ignition plugs vastly less sensitive to the disturbing effect of carbonisation due to partially burnt lubricating oil, and where a car would have either been brought to a standstill some years ago, or have run so badly that the driver could not have failed to notice that something was wrong, the engine now continues to work efficiently, and merely protests against the imperfect regulation of its oil supply by belching forth volumes of blue smoke.

These very improvements, therefore, call for increased vigilance on the part of drivers, who ought all to be anxious not to offend in regard to a matter which is such a fertile source of prejudice and irritation. With a good system of lubrication there is no reason why the exhaust should be rendered objectionable in this way, except possibly when first starting the engine running. The best rule for every car owner to adopt, as pointed out in the Club's circular, is to start up the engine in the garage, and to allow any oil that may have settled in the exhaust passages to escape before taking the car out on the road. If this were always done, the nuisance complained of would practically cease. We are also glad to see that attention has been drawn to the practice—which is only too prevalent—of fitting the final exhaust-pipe so that the gases issue straight out behind the vehicle.

A Sporting Paper's Views.

No one is likely to deny to the *Illustrated Sporting and Dramatic News* a keen appreciation of what constitutes the real elements of sport. Considering the

pronounced views we have expressed, we accordingly feel a certain degree of satisfaction that our sporting contemporary takes identically the same view as ourselves in regard to speed events on short tracks, such as those recently held at Blackpool and Brighton—i.e., that such events are, speaking generally, deficient in interest and in the elements which produce the agreeable excitement associated with contests in which the sporting element is really predominant. In a thoughtful and well considered leading article on the subject in a recent number, which is obviously from the pen of someone intimately acquainted with the automobile question from every point of view, these aspects of speed contests over short tracks are admirably summed up by our contemporary. Even the track contests of racing cars, the *Illustrated Sporting and Dramatic News* looks upon as deficient in interest, since for such short distances the race is determined entirely by inherent speed of car and correctness of adjustment, with the consequence that, after the first few yards, the result can be foreseen with considerable certainty. The skill, endurance, and judgment of the driver are not called out as in lengthy contests of the Gordon-Bennett kind. As regards races of touring cars, our sporting contemporary is in absolute accord with ourselves. The people who buy touring cars do not, as a general rule, it observes, want to tear along our roads at three times the legal speed. They want vehicles to effectively replace, at somewhat higher maximum speed, at a considerably higher average speed, and over greatly extended distances, the ordinary carriage and pair of horses. The *Illustrated Sporting and Dramatic News* sums up the situation concisely by observing that nobody ever thinks of organising races for carriage and cab horses. That is the case in a nutshell.

Motor Boat Trials.

WE desire to offer our heartiest congratulations to the judges for the remarkable celerity with which they have got out their report on a very elaborate and extended series of trials. They must have worked at great speed and high pressure, and it is, therefore, worthy of even still further praise that they should have succeeded in making their report not merely compendious but extremely concise. The judges "have deserved well of the Republic" of automobilists both on land and sea.

We print the report in full on another page, but it may be as well to sum up shortly here its leading features, since motor boat builders in the future would certainly be unwise to neglect their recommendations. The judges are of opinion that many of the boats had their petrol tanks badly arranged, and that the pipes between the tanks and the carburettors were generally inadequately protected, and not sufficiently strong. In this connection, they recommend the pressure-feed system as more suitable to boat work, and finally they point out that, with regard to the ignition apparatus, the electric fittings have not, in general, been well designed for marine work, while the motors themselves might be greatly improved in the matter of noiselessness.

When, however, all these adverse criticisms have been made, the judges' report shows with considerable clearness that the record of the trials has been a fine one. There has been practically no noticeable depreciation, and the competing boats have mostly emerged from the ordeal in as good condition as that in which they entered upon it.

Explanation.

(GM) Gold medal. (SM) Silver medal. † Special award for best British boat in its class. * Privately owned boat.
‡ Autocar Challenge Cup.

Hulls.—All hulls are carvel-built of wood with the exception of No. 27, which is constructed on the Saunders principle, No. 35, which is carvel-built of steel, and Nos. 36 and 37, which are clench-built of steel.

Engines.—All internal combustion engines work on the four-stroke cycle where not otherwise stated. (X) Two-stroke cycle.

Fuel.—All engines use petrol where not otherwise stated. (K) Kerosene. (G) Producer gas. (S) Steam.

Course.—(C) "Sheltered," Southampton Water only. (°) These boats took the sheltered course on the second day only. (O) Open course out into the Solent round Solent Bank's Buoy.

Performance.—All boats ran for approximately 10 hours on the first day, but the times given above are those which the boats took to complete the stated laps. The difference between this time and the ten hours was made up over an indefinitely shorter course. On the second day the course was altered for safety and no distances are available, but each boat remained on the water for approximately five hours.

Stoppages.—(NS) Non-stop. (R) Retired. (D) Disqualified. (Scr) Scratched. ¹Filling petrol tank. ²Sea too rough to start ³Exhaust valve stem stuck. ⁴Filling petrol tank. ⁵Broken contact spring. ⁶Choked circulating pump and dirt in petrol pipe. ⁷Ignition trouble. ⁸Leaky drain-cock on high-pressure cylinder. ⁹Stopped engine through reversing too quickly. ¹⁰Sea too rough. ¹¹Hot clutch. ¹²Choked petrol pipe. ¹³Inlet valve stuck. ¹⁴Sea too rough. ¹⁵Choked paraffin pipe. ¹⁶Choked carburettor. ¹⁷Filling petrol tank. ¹⁸Replacing inlet valve and testing ignition. ¹⁹Cam-shaft jammed. ²⁰Disqualified for not being in dock overnight. ²¹Changing ignition plug and filling petrol tank. ²²Choked carburettor and filling petrol tank. ²³Choked petrol pipe and sea too rough. ²⁴Ignition trouble and propeller fouled cable while at anchor; towed in. ²⁵Broken pump chain. ²⁶Sea too rough. ²⁷Ignition trouble. ²⁸Ignition trouble. ²⁹Choked paraffin pipe. ³⁰Loose ignition wire. ³¹Choked paraffin pipe. ³²Started too soon on poor quality gas, and after re-starting, the circulating pump broke down. (°) These boats took the sheltered course on second day only.

The 12-h.p. Thornycroft launch (No. 5, Class 3).

MOTOR YACHT RELIABILITY TRIALS.

THE AWARDS.

The judges recommend that the following medals be awarded.

The points on which the marks were awarded will be published in detail next week.

Class II.—**Silver Medal.**—No. 2, J. I. Thornycroft and Co.

Class III.—**Gold Medal.**—No. 8, Simpson, Strickland and Co (steam).

Silver Medal.—No. 5, J. I. Thornycroft and Co.

Class IV.—**Gold Medal.**—No. 14, Simpson, Strickland and Co. (steam).

Gold Medal.—(Placed at the disposal of the judges by Lionel de Rothschild, Esq., for award in any class).—No. 20, Viscount Royston's "Revolution."

Silver Medal.—No. 17, Maudslay Motor Company.

Class VI.—No award.

Class VII.—**Gold Medal.**—No. 35, Perman and Co. (paraffin).

Silver Medal.—No. 33, S. F. Edge's "Napier Major."

They further recommend that a **Special Gold Medal** be given to Messrs. J. I. Thornycroft and Co. in recognition of their successful efforts to adapt the suction gas-producer type of motor to marine work.

Special Awards for the best all-British boat in each class are won by:—

Class II.—No. 2, J. I. Thornycroft and Co.

Class III.—No. 8, Simpson, Strickland and Co. (steam).

Class IV.—No. 14, Simpson, Strickland and Co. (steam).

Class VI.—No. 29, A. B. Collis, Limited.

Class VII.—No. 33, S. F. Edge, Napier Major.

The special prize for paraffin motors in Classes I., II., III., and IV. has not been awarded owing to lack of entries. Competitor No. 32, entered by Messrs. Woodnutt and Co., which made most satisfactory running on petroleum only, is not eligible for this prize, as she is in Class VII.

The "**Autocar**" Challenge Cup is awarded to Messrs. Perman and Co. for No. 35, as it is considered by the judges to have made the most meritorious performance irrespective of class.

MOTOR YACHT RELIABILITY TRIALS.—The 16-h.p. Simpson-Strickland steam launch (No. 14, Class 4), and Mr. P. C. Crossley's 12-h.p. boat (No. 6, Class 3).

MOTOR YACHT RELIABILITY TRIALS.—The 16-h.p. Scott Stirling boat (No. 11, Class 3).

THE second annual reliability trial for motor boats, organised for the first time by the A.C.G.B.I. last year, but this year held under the auspices of the Motor Yacht Club, took place on August 2nd and 3rd in Southampton Water and the Solent. The programme contained 37 entries, but the actual number of starters on the first day was 33, this number including boats of all kinds and sizes from a little 18 ft. open dinghy up to a 60 ft. yacht with roomy cabin accommodation. The competitors were divided into three restricted classes and two unrestricted classes, steam-boats being eligible in every class, while another of this year's modifications in the arrangements was the provision of an alternative course which allowed the more seaworthy boats an opportunity of proving their fitness for general use by going out into the Solent.

Ten consecutive hours—the duration of the test on the first day—is a very fair trial in its way for a motor boat, even when weather is fair, but when it is followed on the next day—as it was this year—by another five consecutive hours in a rough sea, and under a perfect deluge of rain, the trial run actually becomes a test of great value to all interested in motor boating, either as a pastime or an industry. It is necessary to qualify the approval of a boat which does a ten hours' run on a fine calm day, such as was the opening day of this year's event, because—as a trial—it is almost solely an engine test. If the engine

is sufficiently powerful, it may drive the boat fast enough to demonstrate the "dryness" of the hull under such conditions, but in no other respect is it a test for the boat as a whole, although as we have said it may be considered to constitute a very fair trial run. Happily—though this is hardly the opinion of the majority of the competitors and honorary observers—the weather changed for the second day, and the rough sea provided the necessary test of reliability which was so desirable in order to establish the seaworthiness of the boats. On the whole, therefore, the weather condition may be considered as being distinctly auspicious, even if a trifle unpleasant.

The desirable features about motor boats, which must be brought into prominence by any successful trial, are as numerous as, but very different from, those which it is the object of a trial to emphasise in motor cars. For instance, a motor-boat engine is normally required to work constantly at full load, whereas the engine in a car only works at full load when going up hills. Not only must the engine on a boat work under such conditions, but it is essential that it should never stop accidentally, because if the engine stops the boat is virtually out of control, and if without anchorage will be at the mercy of wind and tide. Any successful trial of motor boats, therefore, should ensure the efficient testing of these qualities as regards the engine as well as the seaworthiness of the boat, while such other

MOTOR YACHT RELIABILITY TRIALS.

MOTOR YACHT RELIABILITY TRIALS.—The 12-h.p. Woodnutt sea-going motor yacht (No. 32, Class 7), and the 12-h.p. Thornycroft launch (No. 5, Class 3). The former boat uses kerosene for fuel.

matters as suitability, comfort, convenience and safety of arrangement must of necessity be decided by the discretion of the judges. The M.Y.C. trials have been well calculated to ensure the reliability of the engines, because the duration of the trials on each day was amply sufficient to enable most imperfections to mature. This year, as we have said, the elements also lent their support, and provided a test for the boats as a whole, besides an additional—and very necessary—test for the ignition system of the engine.

It is difficult to discriminate between the exact nature of the trial which is suitable for boats of each class, and an owner may be supposed to exercise reasonable care in the use of his craft and not take an obviously unsuitable boat out in all weathers. From the point of view of a test for the small open boats, therefore, the state of the sea was unnecessarily rough, although the wetness was most desirable as a means of testing the efficiency of the insulation for the ignition—many of these small boats not going fast enough in calm water to drive spray on board. For the larger boats, on the other hand, the weather conditions were none too severe, and it offered an opportunity of showing which boats were really sea-going and which had merely entered for the “open” course on the off-chance of fair weather.

The merits and demerits of the various craft are dealt with in the judges’ report. The results of the trials, as shown by the actual performances of the competing craft, are summarised in the table which we now publish,

so that it is with regard to the seaworthiness of the boat, and particularly with regard to the convenience and safety of its “internal economy,” that the official report mainly deals. It is both complete and outspoken, and will no doubt form a basis for improvement in future manufacture, and a guide to the daily increasing number of present purchasers.

Last year, there were but 26 entries, this year that number was increased to 37, but in addition to this increase in mere numbers there was more variety in type, and indeed No. 4 graving dock at Southampton probably contained, on the nights of the eventful days, the most interesting collection of small self-propelled craft which has ever been brought together up to the present time. The sea-going motor yachts of Class VII. not unnaturally received their share of attention, for they have many attractions, and will undoubtedly become more and more popular as time goes on. The largest of these boats was “Emil Capitaine,” a 60-ft. yacht, constructed and engined by J. I. Thornycroft, Limited. A suction-gas producer plant is installed in this boat—the same as that which we described in our recent article on “Marine Gas Engines,” with the exception of certain modifications only introduced by Messrs. Thornycroft just before the trials. There is no doubt that this craft—which is an entirely new departure in marine propulsion—excited a great deal of interest, and both Herr Capitaine the inventor, and Messrs. Thornycroft the constructors, are to be congratulated on the venture.

Messrs. Perman and Company’s 24-h.p. Delahaye-engined boat (No. 22, Class 4),

The 40-h.p. Maudslay launch (No. 17, Class 4).

MOTOR YACHT RELIABILITY TRIALS.

D 2

MOTOR YACHT RELIABILITY TRIALS.—The 40-h.p. Flat boat (No. 23, Class 4).

On the first day, a non-stop run was placed to the boat's credit, but on the second day the circulating pump got choked up and spoiled her performance. It requires about 15 minutes for starting up, and on the second day when only ten minutes was allowed by the club, Herr Capitaine in the excitement of the moment insisted on starting to time, with the result that the engine stopped when they had reached the mark boat on account of the poor quality of the gas produced. It was subsequent to this temporary delay, however, that the circulating pump gave trouble, and caused so much loss of time. From all accounts, the gas-boat is an extremely comfortable craft, economical and devoid of any inconvenience, which might possibly accrue from the use of gas in a less well-designed apparatus.

Messrs. Thornycroft also entered another boat in Class VII., this being fitted with a powerful four-cylinder kerosene engine. The engine is constructed to start on kerosene, after heating the vaporisers with a blow-lamp, and a compressed air plant, coupled up to a small auxiliary petrol engine, is provided instead of a mechanical starting gear. The build of the hull has rather the lines of a "destroyer," which gave it quite a warlike appearance in the water. Another kerosene boat in this class was the Kromhout, entered by Messrs. Perman and Co. The Kromhout is a Dutch boat, and is fitted with a large single-cylinder engine constructed by Goedkoop, of Amsterdam. When starting, a small quantity of petrol is employed, although it is possible by means of a special attachment to start the engine on paraffin with the aid of a blow-lamp. The whole boat has been designed for a particular purpose—use on the Dutch canals—and its

lines and construction are strange to English eyes. The low freeboard—necessary to prevent it from being blown by the wind—belies the roomy and comfortable interior obtained from the deep draught. The boat is intended to be entirely within the capabilities of one man, who, since he must always be at the helm, has practically no time to look after the engine, which, in consequence, must be capable of running indefinitely without attention, in support of which claim the results show that it was the only kerosene boat to make non-stop runs on both days.

Only one other boat made a non-stop run in this class, and that was the now famous Napier Major, with the design of which our readers are already familiar. Only this much more need be said of it, that its businesslike but withall graceful lines have seldom shown to better advantage than during the trials. Messrs. Woodnutt and Co. were the only other entrants in this class, their boat being less elaborate than the others already mentioned. The engine, which is of American make, has been adapted by them to use kerosene, a special vapouriser having been fitted for this purpose which enables the engine to be started from cold with the aid of a blow lamp.

In the other classes, fewer boats call for special mention, but the two steamboats entered by Messrs. Simpson Strickland are of special interest, as showing what can be done with steam plant on small boats at the present day. The larger of these two craft, a roomy pinnacle identical with those supplied to the P. and O. liners, is fitted with a fire-tube "Kingdon" boiler of the vertical type, and a small compound engine developing about 16-h.p.

MOTOR YACHT RELIABILITY TRIALS.—Messrs. Gorham and Manville's 28-h.p. 40-ft. Daimler craft.

MOTOR YACHT RELIABILITY TRIALS.—The 18-h.p. 35-ft. Wolseley petrol launch (No. 30, Class 6).

Neither boiler nor engine occupy a large amount of space, but the forward part of the boat is in general given over to their accommodation, and that of the coal bunkers and water tanks. For a large open boat of this type, a steam plant is very suitable on account of its extreme flexibility, enabling the speed of the boat to be more easily regulated to suit the weather. The control of the engine is, of course, simplicity itself, and both engine and boiler are well within the capacity of one man's attention. Under ordinary circumstances, it would take about half an hour to get up steam, but by a little manual labour applied to a fan this time may be reduced by as much as 50 per cent.—a proceeding which is not recommended except in emergency—while, if the boat has been in use the previous evening, the boiler is capable of holding sufficient heat overnight, to make steam-raising a matter of only a few minutes, as it is on the smaller of the two Simpson-Strickland boats, which has a water-tube boiler and quadruple-expansion engines with tandem cylinders. During the trials, both boats suffered from using bad coal, but the only stop was that made by the smaller boat in order to repair a leaky drain cock.

Taking the boats as a whole, most of them appeared to be comfortable enough, although many of the smaller craft obviously had only limited sea-going capacities. It is possible to build a small boat which shall have a very high factor of safety, but it involves decking the boat in fore and aft, which not only limits the accommodation but also affects the accessibility of the machinery—con-

verting the boat as it were into a "two-seater." Such boats as those entered by Mr. Fentiman and Capt. Dixon were of this type, while Lord Howard de Walden's racing Napier is, of course, also well protected. Among the more open type, however, the Thornycroft boat No. 15, the Iris and the Delahaye appeared to be very seaworthy, and the engines were protected by a semi-permanent waterproof hood.

For those who do not require high speed, there were two pretty little De Dion boats—one of them being handled by Mr. Stocks, whose racing fame lent humour to his situation at the helm of one of the slowest craft in the competition—both of which performed excellently. Viscount Royston's boat, Revolution, had a particularly neat appearance, and the Napier engine with which she is fitted secured for the boat the honour of two non-stop runs. Unfortunately, the Fiat boat did not turn up in time to be docked overnight in accordance with the rule, and although she ran very successfully on the first day, the Club had to disqualify her for committing this technical irregularity. The Vosper was another boat which had not materialised at the hour the dock gates were closed on the evening prior to the first day's run, but we understand that she was not disqualified, because the owners had sent a satisfactory explanation to the committee. In the event this was not of much importance, for the boat abandoned the trial during the first day's run. As in last year's event, so in this, Miss Larkins, niece of Lieut. Mansfield Smith-Cumming, who took charge of the Wolseley boat, was the only lady competitor on board

MOTOR YACHT RELIABILITY TRIALS.—In front is the Thornycroft 60-ft. "producer gas" sea-going yacht (No. 37, Class 7), Messrs. Groves, Guttridge and Company's little 18-ft. 6-h.p. Dean and Burden launch (No. 1, Class 2) behind.

MOTOR YACHT RELIABILITY TRIALS.—The 75-h.p. Thornycroft sea-going yacht (No. 36, Class 7). This 50-ft. boat uses kerosene for fuel.

the smaller craft, although other ladies, less actively engaged in the trial, were to be seen on the large sea-going yachts.

Two boats abandoned the trial on the first day, and four others did not start on the next morning. On the second day, owing to the rough weather, the open course was made optional, and, as we have said, after a short time the sheltered course was altered so as to keep all boats under immediate observation. As this new course was marked by the temporary position of Sir George Newnes' yacht, the "Albion," and the warship "Brilliant," the exact distance cannot be measured on the chart. The course, however, was quite short and kept all the boats within easy reach of each other and of the mark-boat. Times for the various circuits were taken in the usual way, but we do not give these, because mere times by themselves are of no importance; we therefore give only the times and distances for the first day, but our table shows the causes of stoppages on both days. On the first day, it must be understood that the water was quite calm, but on the second day both wind and sea were high, and it was then far more important to keep going under such conditions than to make high speed—which indeed would be quite out of the question with an open boat. The boats started from the mark-boat at 8 a.m. each morning, but on the second day the trial was officially stopped after 1 p.m., so that each boat ran on that day approximately 5 hours.

Organising such trials as these is naturally no mean task, and those who are responsible deserve congratulations on their success. Motor boat events this year have had a habit of ending in fiasco, and, under less good management, it would have been well within the bounds of possibility for these to have resulted even in fatality. In this connection, Major Lindsay Lloyd, who together with Lieut. Mansfield Smith-Cumming and Mr. Bernard Redwood represented the Club on board the mark-boat, deserves praise for the promptitude with which he took steps to alter the course on the second day in such a manner that all the boats should be under constant observation and within reach of help. The curtailing of the trial just prior to the change of tide, which would

have made the sea worse, was another step in the right direction, it being impossible to make special arrangements for some boats to continue and others to go home.

One and all had already had a severe trial, and the general cessation of events was undoubtedly the wisest policy to pursue, for any fatality must inevitably have done harm both to the industry and to the club. The organisation at the dock was, thanks to the energies of the hon. dockmaster, Mr. Cooper, and the assistant secretary, equally well carried out; and, indeed, Mr. Morris, the secretary of the M.Y.C., may congratulate himself that he was so ably seconded in his labours.

After going to press last week with our table of entries, a change was made in the official numbers of some of the boats in Class III, the Simpson-Strickland boat being numbered 8 instead of 5, and the boats previously numbered 6, 7 and 8 each taking the next lower number.

We draw attention to this fact because the numbering of the boats is almost the sole means of identification. If these numbers are wrongly indexed, interested observers of the trials are consequently greatly confused, and both manufacturers and buyers suffer accordingly. It may appear a small matter, but it is an important one, and we trust that the club will recollect in future that the Press are the main means of communication between the public, whom it is all important to interest, and the industry which it should be their duty to encourage, and that they will prepare accurate programmes in advance, so that in giving the event the desired publicity the Press may be supplying their readers with useful and reliable information.

JUDGES' REPORT.

That the value of these trials is thoroughly appreciated by owners and manufacturers of motor yachts and boats is shown by the large number of entries received, the wide range and nature of the vessels competing, and the energy and determination displayed by competitors to demonstrate to the utmost the qualities of these vessels.

The 31 vessels which started for the trials on 2nd August comprised a very large number of types, from an 18-ft. yacht's launch to a 60-ft. harbour general service vessel, and from a light river launch to a high-powered and fast racing boat.

The trials were originally intended to extend over twenty hours, ten hours' continuous running being completed on each day. On 2nd August this programme was adhered to. On 3rd August, however, the trial was stopped by the judges at the end of 5 hours, owing to the very heavy weather which was experienced—which although it did not seriously affect the running of the larger vessels, was considered to impose an unnecessarily severe strain on the smaller boats, although many of these—as will be seen by a reference to the table of performances—were well able to hold their own.

This shortening of the course on account of the weather should not be considered as having depreciated the value of these trials, as the adverse conditions which extended over the whole of the five hours' running on the second day enabled most of the competitors to demonstrate to an unexpected degree the seaworthiness and consequent value of their craft, and also to show that internal-combustion motors are not liable to be injuriously affected by the pitching and rolling of a small boat in broken water.

Taken as a whole, the design and equipment of the boats shows a marked advance. Many features of the boats of last year's trials having been improved upon.

The judges, however, note with regret that an important exception to the above was found in the methods of fuel storage and supply in the petrol boats which, except in one or two notable instances, left much to be desired.

The chief defect noted in this respect was the connections between the tank and the carburettor, which in many cases consisted of a small pipe indifferently fitted to the tank, and led unprotected, and in some cases right through the middle of the fore-peak, exposed and liable to damage.

That the defect can be avoided was shown by the well thought out and strongly fitted connections in Napier Major, No. 33, and the protected pipes in the Mitcham Company's launch, No. 7.

It appears to the judges that by the adoption of a pressure fed system of fuel supply many difficulties in the way of a really satisfactory installation are removed, especially in the smaller open boats.

There appears to be scope for considerable improvement in the direction of quiet running of the engines—in several instances a motor whose exhaust was efficiently silenced was yet rendered noisy by clattering valves and tappets or by an inefficiently silenced air intake.

The electrical connections and fittings in some of the smaller boats leave much to be desired. Open switches and loose leads are not suitable for boat work.

In pointing out the above defects, the judges do not intend these criticisms to be condemnatory, but stress has been laid upon them in order to indicate in what directions it appears that improvements can be made.

The condition of the boats and machinery after the trial was generally excellent, few boats showing signs of having suffered any depreciation whatever, and in nearly every case the motors were started without difficulty during the judges' inspection on 4th August, although they had had no attention after their severe work in the previous day's bad weather.

The judges wish to call special attention to three vessels entered in Class VII., which presented features of exceptional interest.

No. 33, Napier Major, is a wholesome type of sea-going cruiser, well designed and built, and with a soundly constructed and well installed engine. She is a type of motor yacht which should become popular.

No. 35, Werf Kromhout, is driven by a motor which appears to the judges to be conveniently suited for barge or fishing boat work.

This motor employs petroleum as fuel, but has to be started on petrol. The objections, however, to the use of petrol in this respect, are reduced to a minimum owing to the ingenious manner in which it is utilized. No petrol tank or pipes are necessary. The petrol container on the engine having been once filled is completely insulated, and the whole of its contents are consumed without further attention, the transference from one fuel to another being automatic.

The Goedkoop Motor is simple in design, strongly constructed, and self-contained, and should be capable of withstanding any amount of rough usage.

No. 37, Emil Capitaine is a harbour launch fitted with a producer, gas plant, and motor. The producer is similar to an ordinary land suction gas-producer plant, with the exception of the cooler, scrubber, and drier, which have had to be specially designed in order to meet the requirements of marine work.

The motor is a 4-cylinder vertical one of a novel type, specially designed with a view to accessibility.

The main feature of this vessel's performances during the trials was her economy of fuel. The consumption of coal during the ten hours' trial on August 2nd being only 467 pounds, costing 4s. 6d.

The system opens a new field, and is recommended to the attention of all users of power boats to whom economy of fuel is of the first importance.

This is the first year in which steam boats have been admitted to these trials. The rapidity with which the Simpson-Strickland launches raised steam proved that in the matter of quickness of getting under way steam vessels can be constructed so as to be not far behind those fitted with internal-combustion motors.

In conclusion, the judges wish to express their thanks to the many gentlemen who assisted in the trials by lending launches, daying-out marks, and by undertaking the arduous duties of observers, which post on the second day was one of considerable discomfort. They wish also to thank Mr. H. J. Swindly, who acted throughout the trials as honorary timekeeper, and in this position afforded most valuable assistance.

MANSFIELD CUMMING, F. LINDSAY LLOYD, } Judges.
F. R. S. BIRCHAM, BERNARD B. REDWOOD, }

MOTOR YACHT RELIABILITY TRIALS.—Lord Howard de Walden's 80-h.p. 40-ft. Napier boat with Saunders hull (No. 27, Class 6).

Dust Prevention.—It is of interest to note, while so much attention is being bestowed on the dust-laying problem, that Mr. C. B. Davis, of Droitwich, maintains that if roads are simply strewn with the salt scale from the salt pans, ground fine for the purpose, they will never be dusty. We presume this is due to the presence of chloride of magnesium, which has a great tendency always to remain moist under any circumstances. If this is the explanation it would be a confirmation of the theory advanced in our columns that chloride of calcium would also prove effective, and, as we are inclined to think, more so.

APROPPOS of police-trap tactics, at the sitting of the Uckfield Bench last week no less than nine unfortunate motorists were haled before it, on all of whom fines were inflicted varying from four to twenty guineas. In another case, heard at Uckfield, Earl Russell, who appeared for the defence, raised the novel point that there was no evidence to show that the watch of the electrical timing apparatus started immediately the policeman pressed the button at the other end of the measured furlong. The Bench upheld the point, and the case was dismissed—a triumph for Earl Russell in one of his first appearances as a practising barrister!

THE DELAUNAY-BELLEVILLE PETROL CARS.—PART II.

THE engine cylinders have a bore and stroke of 105 and 130 mm., while in the 16-h.p. and 40-h.p. models these dimensions are 90 by 130 mm. and 130 by 140 mm. respectively. The engine—which is shown from either

as the suction in the mixing-chamber exceeds a predetermined value. The throttle-valve is inter-connected with a centrifugal governor, and may also be closed by means of the pedal, A⁴ (Fig. 11). For normal running, the "throttle" is under the driver's control by means of one of the hand-levers above the steering-wheel.

The lubrication of the engine is positive and automatic, not merely relying upon the action of the revolving cranks on the oil in the base-chamber. As a matter of fact, the oil—although carried to the lower half of the crank-chamber—is never allowed to reach such a level that the cranks can dip into it. The bottom of the base-chamber slopes downwards towards the flywheel, and the oil, in consequence, collects at that end of the chamber. From this reservoir, it is circulated through all the bearings by means of a small force pump. The pump—shown on a larger scale in Fig. 8—is enclosed in a small detachable casing, C, which forms part of the base-chamber, and consists of a plunger, C¹—which is driven by an eccentric from the main crank-shaft, D—and a cylinder, C², which automatically oscillates about the stationary valve-plate, C³, when the plunger works to and fro in it. During the outward stroke of the plunger, C¹, the cylinder assumes such a position relatively to the valve plate, C³, that the oil can find its way through the port, C⁴, into the space beneath the plunger. During the return, down stroke, the port, C⁴, is closed, and the corresponding port, C⁵, on the other side of the valve-plate, C³, is opened so that the oil

is discharged into the feed-pipes, C⁶. The main feed-pipe is formed in the bottom of the base-chamber casting (see Fig. 7), and the oil finds its way, first to the crank-shaft bearings, and then to the interior of the hollow crank-shaft itself. The connecting-rods are also hollow,

Fig. 4.—Front view of the 24-h.p. Delaunay-Belleville Chassis, showing the arrangement of the steering heads and the curved front axle.

side in Figs. 5 and 6 and in sectional elevation in Fig. 7—is supported direct from the side-members of the main frame, and the cylinders are cast separately with their valves arranged symmetrically on the two sides. Alongside the inlet-valves are the low-tension igniters, which are operated by the tappet-rods, B¹, from the inlet-valve cam-shaft, and are supplied with current from the gear-driven magneto, B. The "live" portions of the igniters form separate plug-fittings, and the switch-contacts, B²—which are prominent in Fig. 6 and are conveniently arranged—are very substantially made. The "timing" of the ignition is accomplished by the driver, who has command of a small hand-lever situated above the steering wheel.

On the same side of the engine is the carburettor, of which the float-feed-chamber, A, is just visible in Fig. 6. One of the most noticeable features of the engine are the curved induction-pipes, which have been so designed that the effective distance between the "throttle," A², and the inlet-valves is the same for each cylinder. The mixing-chamber, between the float-feed-chamber, A, and the throttle-valve, A², is shown sectionally in Fig. 9. The jet, A¹, projects, in a sloping direction, into the main air-passage, and there is an automatic auxiliary air-valve, A³, for the admission of cold air at such times

Fig. 5.—The 24-h.p. Delaunay-Belleville Engine, as seen from the exhaust-valve side.

and the oil—after reaching the “big ends”—passes upwards to the hollow gudgeon-pins, through which it is led to the cylinder walls.

The cooling system is the same as that generally adopted on most cars, the centrifugal pump being gear-driven, and the fan behind the radiator belt-driven. The manner in which the fan is fitted is unusual, however, for it revolves in a casing of its own which projects rearwardly from the radiator. The fan is, therefore, enclosed on the sides, and is thereby rendered more efficient. A spring-controlled jockey-pulley is provided for automatically tightening the belt, it being impossible, with the arrangement adopted, to shift the fan bodily upwards.

(To be concluded.)

London Traffic and the Commission Report.—We are glad to see that the *Daily Telegraph*, with that perspicuity which has always characterised its treatment of automobile and allied problems, is very dissatisfied with the Traffic Commission's Report. The *Telegraph* objects to the conclusions of the Commissioners for precisely the same reasons as those which have induced the AUTOMOTOR JOURNAL to adopt a critical attitude towards the Report. The *Telegraph's* remarks deserve extensive quotation. The most trenchant passages are as follows:—

“After the summer vacation the Highways Committee of the London County Council will submit plans for new tramways costing £414,160, as at present indicated, and involving a further sum of £209,034 in widening streets . . . Taking this in connection with the first volume of the Traffic Commission Report, just issued, it would appear that unless great caution is exercised London will once more be embarked upon a ruinous policy which will postpone the solution of the traffic problems for almost another century. Much indignation has been shown in some quarters at the delay caused by the recent adverse vote in the House of Lords,¹ but, without any undue disregard for the claims of working men, or for the vast majority of the poorer populations round the richer centres of fashionable society, it is possible to sympathise with a wise refusal to sanction plans which entail far more difficulties than are obvious at first sight. . . .

The Traffic Commission, apparently oblivious of the fact that 27,000 vehicles pass the Mansion House every twelve hours, have actually, in their majority report, suggested tram lines through the City. That one suggestion is sufficient to condemn the spirit in which the report was considered, though nothing, of course, can be said against the industry and good faith with which the numberless details it presents have been collected.

Far more astonishing is the absolute neglect in the Report, save for three passing references, of the future of that motor traffic which will eventually revolutionise the streets of London, by improving their surface, by abolishing dust and the worst forms of dirt, and, above all, by regulating the comparative speed of vehicles in their relation to each other, and to the whole mass in movement. To state present conditions is to condemn them. We can see now a fine mixed assemblage of babies, pedestrians, costers' handcars, donkey wagons, hansoms, four-wheelers, omnibuses, trams, and motor cars, all on the same road, all going at different degrees of speed, and all impeding one another.

A report which neglected the obvious influence of the motor upon all this was hardly likely to consider the possibility of such moving platforms as were proved to be of immense utility at the last Paris Exhibition; nor, of course, could it contemplate the small, swift, constantly-running screw-steamers on a tideless Thames which would result from a dam at Gravesend, and would carry as much traffic as the bateaux-mouches upon the Seine. The last two matters may still fairly be called problematical; but they at least deserved attention. The motor car has long ago proved its utility for the exact form of locomotion needed.

THE TOURIST TROPHY—(continued).

THE article on this subject, in which we not only attempted to familiarise our readers with the fundamental principles of this novel type of competition for touring cars, but also put forward various suggestions for future years, appeared in our issues of July 15th, 22nd and 29th, and in our editorial front paragraphs we invited all those who took sufficient interest in the automobile movement to write expressing their views. A number of useful communications from leading men have already appeared in our columns during the last two weeks, and we now publish a further batch of the numerous and very valuable contributions that have come to hand. We would again express our hearty thanks to all those who are coming forward and are helping to ventilate this important matter in the interests of the whole automobile industry.

To facilitate reference to the various specific points raised in our article, and referred to by our correspondents, we reproduce the summary of the chief suggestions put forward by us, as also the list of the weights, measures and dimensions that are specified by the rules for this year's race.

Suggested Modifications of Rules for Future Years.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

Specified Weights, Measures, and Dimensions in the Existing Tourist Trophy Rules for this Year.

- (A) *Fuel Consumption*.—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*.—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

VIEWS AND OPINIONS OF OUR READERS.—III.

Mr. Basil H. Joy:—

I am very glad to see that you have taken up the question of the Tourist Trophy Race so thoroughly in your columns, and I only hope that the motoring public generally—to say nothing of manufacturers—will appreciate the opportunity that you have thus afforded them, not only of giving this entirely novel type of event their close attention and support, but of putting forward their own views. For my own part, I have always felt that—apart from the difficulty of framing really satisfactory rules for such a contest—the success of the T.T. depends very much upon the extent to which its provisions and their effects are generally understood, so that the enormous amount of work which has been bestowed on the subject by the organising committee who framed the regulations for this year, might meet with its full deserts. It has, I think, been fully realised, even by those who have given themselves heart and soul to the consideration of the subject, who have known what they were striving for, and have thoroughly thrashed out every point, that modifications of the existing regulations may well be found advisable for future years, and that many improvements will doubtless suggest themselves as a result of the experience gained by this year's race.

Much of the success of the race, from a spectacular point of view, will, of course, depend on the completeness of the organisation with a view to giving the public a clear understanding as to exactly what is taking place, the relative positions of the cars, and at any time during the race, &c., &c. The weighing and measuring of some 50 cars, and the checking of the fuel, will be no small matter to get through in reasonable time, and will necessitate very clear and complete instructions being drawn up and placed in the hands of the officials and competitors, but with the experience of the large entries and the successful organisation shown at Brighton, I do not think that this will be found at fault.

In your article you have so thoroughly and fairly covered the whole ground that there is not much left to do beyond expressing an opinion on the merits or otherwise of the suggested modifications as summarised at the conclusion of the article:—

1. Having regard to the fact that, as you point out, the bodies are often supplied by firms other than the makers of the chassis, I think that your suggestion would defeat a maker who supplied chassis alone, while at the same time allowing of a special form of body to give the frame the necessary strength. But it would be unfair if it were concluded from the regulations to the makers who adopt that practice admittedly but insist on supplying only complete cars in consequence.

2. I certainly think that this and many other details, which will be learned by experience, should be included in the regulations. It is very difficult to draw the line between a freak and a genuine car, unless hard and fast lines are laid down in the regulations. Difficulties have already arisen in this connection in the 1902 and 1903 trials held by the club.

3. I do not agree with this, as it would bar out any change-speed

mechanism having a universal range from zero to maximum, if such an ideal were to be produced.

4. I do not agree with this as a regulation. See note on 2.

5. Although I quite agree with this suggestion, I think that the discretion must essentially be that of a duly qualified body of judges, since no reliance should be placed on the impressions of mere spectators.

6. To give real data as to reliability and durability, 250 miles is of course practically useless, and I hardly see that if the race were extended to three days, giving 750 miles, the result would be much better. In view of the greatly increased difficulty of organisation, and the possibility of mistakes in timing, and the additional expense, I therefore think that one day is, on the whole, best.

7. I think it more than probable that the organisers would do this in any case.

8. Since the course will be clear for a "race," there should, I think, be no "controls" at all, particularly as they are apt to introduce possibilities of mistakes being made.

9. This would not be very practicable if there were no controls, or even necessary if the race were completed in one day.

11. I certainly think that this might be a good scheme, after the necessary experience has been gained in this year's race.

In regard to the specified weights, &c., I am rather sorry that the mileage per gallon has not been laid down as, say, 30 miles, in order to attempt to reduce the speed from that anticipated, viz., 25 m.p.h., to 20 m.p.h. In view of the present state of feeling against motor cars, it would at least have looked better if the legal limit had been aimed at.

"F." It appears to me that this means of specifying the length of the chassis, or rather a part of it, which is what it amounts to, puts such cars as the Lanchester, Oldsmobile, Duryea, &c., on a different footing from those having the engines in front, although I do not see that this will give a material advantage to either, and have no doubt but that the committee carefully consider the point.

Referring to the general questions at issue, I should like to say that I am something more than pleased to see that the A.C.G.B.I. is—although not altogether forsaking racing pure and simple—giving such enormous prominence to what must be considered a glorified reliability trial. Motor car racing is not for this country, and although undoubtedly it has up to now done wonders for the development of the car, it is past its prime. Reliability trials on the now well-known lines have also seen their best days. Long distance trials up to 4,000 and 5,000 miles, such as those carried out by the Martini and Siddeley cars, and the 2,000 miles of the Straker 'bus, have not caught on; they are costly in comparison with the advertisement obtained, and are bound to die a natural death. The idea, therefore, of giving makers certain exact limitations with which they have to conform, strikes me as being excellent, and the winner will probably be found in the maker who has been able to compile the most complete data from his experience, and who brings the greatest amount of science to bear on his designs.

It might appear to one who had not gone very deeply into the matter, as if credit ought to be given for unconsumed fuel, or to a fast car which arrives say within a yard of the finishing line long before other competitors, and then runs out of fuel, but it must be remembered that rules are rules, and that the maker who most nearly complies with *all* the conditions is the man who is deserving of the whole of the credit, and not the man who excels in one condition only.

Don't H. for

Messrs. Legros and Knowles, Ltd. :—

You ask us for our opinion on the Tourist Trophy Rules after considering your article on the subject. Taking the "points" of a good car which you mention, there is no doubt that the following can be directly encouraged :—Reliability, Speediness, Flexibility, Hill-Climbing, Efficiency. Durability cannot possibly come into such a contest at all unless it is unduly extended. We think that such qualities as Silence, Ease of Control, Absence of Vibration, &c., which bring in to such a large extent the personal equation of the judges, should, under no circumstances, receive marks which would affect the placing of a car, provided that they are sufficiently in evidence to justify the car being considered up to date. The question of "freaks" is a vexed one, but we think again that it would not do to let the opinion of judges settle what is a freak and what is not. If the other rules be made sufficiently explicit, it would seem that freaks could be avoided automatically, *e.g.*, the maximum number of gears and the minimum number of cylinders could be stated, as you suggest.

Our chief point, however, is that the best way to limit horsepower would be on the bore of the cylinder rather than on the fuel consumption. The stroke is of no consequence, for, after all, the best piston speed at which to run a petrol engine is fairly well known now, so that short stroke and high revolution speed, and long stroke with slow revolution speed tend to equalise one another. Your two objections to this method of limitation are (1) the checking of the dimensions; (2), encouragement of high speed of running. The answer to (1) almost every modern engine worthy of the name has an inspection door in the crank-case big enough to introduce a hand with a pair of inside calipers and thus verify the measurement. In cases where this is not so, the manufacturer would, of course, have to bring his cylinders and crank-case to the Club for measurement, and have the two bolted together with, say, a piece of twine having the club seal impressed.

2. Automatically discourages itself, if, as is usually done, it is granted there is a piston speed which gives best results in a petrol engine. This means that a high speed of revolution is only profitable with a short stroke, and we see no reason why this practice of design should be especially discouraged.

To the fuel limit, however, we see many more distinct objections, for it immediately puts a premium on (a) Multiple gears (b) Constant speed engines (c) Hit and miss governing, and directly discourages flexibility; which, after all, is about as important a virtue in a modern car as any. A flexible engine would naturally be controlled altogether on the throttle—as in any modern touring car—and this is notoriously wasteful of fuel.

We see no objection at all to the method of restrictions on weights, and agree that 950 lbs. for the live and dead load for the body is a fair one. With regard, however, to the chassis weight, we think that the upper limit is much too low, unless it be the intention to restrict the competition to very low horse-power as touring cars go. We think 1,800 or even 1,900 lbs. would be a better upper limit to employ. The present limit tends to cutting weight in the chassis, especially in places (*e.g.*, springs and axles) where the stresses must be more or less indeterminate. And this should be rigidly guarded against, as a bad lump in the road could cause danger of accident under the present ruling, whereas cutting body weight could do far less harm.

Your proposal to lengthen the race to three days is, we think, unsound. For a three days' race is surely no test of durability, and would almost certainly cause a loss of interest in the Competition by imbuing it with the monotony of a reliability trial.

To sum up what we advocate.

1. Maximum bore of cylinder to be the engine limit.
2. A body with live and dead load weight of 950 lbs.
3. Chassis weight of 1,300 lbs. minimum and 1,900 lbs. maximum.
4. A definite ruling as to minimum number of cylinders and maximum number of years.
5. No fuel limit, or if any, not more than 16 miles to the gallon.
6. Clear rules on which a "freak" shall be admitted or excluded.
7. Nothing left to the personal idiosyncrasies of the judges,

i.e., marks are not to be awarded on their opinions, but only on performance.

*Legros & Knowles. W.
J. Knowles*

Mr. W. Letts :—

I was very much interested in the article which appeared in your paper on the Tourist Trophy Race.

As soon as the rules and regulations were issued by the Automobile Club for this event, I took the matter up very seriously with the constructors of the De Dietrich vehicles, and was very soon convinced by them that it was very much better to keep out of it than to enter a car which would comply with the rules and regulations as they now stand. The conclusion arrived at was that such a machine would not be a thoroughly reliable touring car, or one in which the makers would have sufficient confidence to induce them to build duplicates for sale to the general public—a condition which is insisted upon from those entering a car for the Tourist Trophy Race.

I believe, however, that this Tourist Trophy Event could be made quite as important as the Gordon-Bennett Race, even though it might never be as exciting, and I take it that what should be aimed at in a tourist car event is to ensure sufficient strength to withstand the heaviest roads, to prove that the brakes are heavy and strong enough to hold the car under any condition, to make sure that the body is roomy and comfortable enough for touring purposes, and to see that the frame is made long enough to carry a comfortable side entrance body. I certainly think, moreover, that the engine should not have less than two cylinders.

In my opinion, most of those who enter cars, to comply with the regulations this year, must build special vehicles, and I very much doubt if the makers will be honestly able to recommend identical cars to their customers, or to guarantee them to give satisfaction under all conditions. The trouble is that the present rules are practically asking the manufacturers to make freak cars. I do not say that everyone will do this, because I know there are some very good cars being built for the race, but I saw one last week that I should consider anything but a reliable touring car; in fact, the chassis put me very much in mind of a Gordon-Bennett racing car which was a little bit overweight. The frame was all bored out to keep the weight down, and every part was so light that even if the car completes the full distance I shall be very much surprised; at any rate, I should say that after the race it will be completely worn out. I fully realise, of course, that this year's race will be the first event of its kind, and that the experience gained will be of inestimable value to those who draw up the rules for next year's competition. I am sure, moreover, that everyone will be grateful to you for going so thoroughly into the subject before the race actually takes place, for your article will at least enable them to take an intelligent interest in it, and to utilise to good purpose the lessons that it may teach. Everyone naturally desires that the rules should make it impossible for any but a thoroughly reliable touring car to win the race, and that they should also give every competitor an equally fair chance; it should, for instance, be impossible for a car having a big 1-cylinder engine with six speeds, or any such monstrosity, to compete at all.

My chief difficulty in forming an opinion concerning the real merits of such a race as that proposed, is that I do not fully understand the extent to which fuel-consumption affects the horse-power of a car, and consequently its speed. This is, of course, a matter upon which the whole success of this type of event depends, and I therefore wait with very much interest to hear what the manufacturers themselves and the people who are building cars for this event have to say upon the matter.

In the main, I thoroughly follow and agree with the line taken in your article, but there is one suggestion put forward with which I totally disagree, *i.e.*, I think it would be absolutely unfair that there should be different drivers for the cars each day, and I should oppose any such measure very strongly. It must be remembered that these cars will be given over to the men who are going to drive them, who will have tested them, and who will know their car in the same way as a racing man knows his racing car, and to hand the car over to a man who is nothing more or less than a driver is, I think, wrong. It might be made optional, but under no condition should a rule be made stipulating that a car must be driven by a different man each day of the competition.

W. Letts

RACES, RECORDS, AND TRIALS.

ARDENNES CIRCUIT.—Hemery, on his four-cylinder Darracq Car, the winner on Monday last of this year's race.

Ardennes Circuit.—On Friday last at Arlon the preliminary weighing formalities for the voituresses and motor cycles took place, the same operation for the cars and light cars being performed at Bastogne on the following day, Saturday. The voituresses and motor cycles took their turn at racing round the small circuit on Saturday, the motor bicycles being sent off shortly after 7 o'clock in the morning, whilst the main attraction of the meeting—the race for the cars and light cars round the big circuit, starting from Bastogne—was reserved for Monday last. Unfortunately the number of entries, however, of the larger fry were considerably less than in previous years, but the best times that have ever been made were put up this year. On the small circuit the first day's racing was over a course starting from Arlon of 40·24 kiloms. This had to be covered five times, making a total of 201·2 kiloms., the whole distance being run without neutralisation. The points of this triangular circuit were Arlon (start), Corne-du-Bois-des-Rendus and Habay. At the start there were 25 motor bicycles and 3 voituresses, 3 of the motor bicycles being above 50 kilogs. in weight. The day's racing resulted in the motor cycle class in a big triumph for the Griffon make of machine, the first three classed being all of this type, ridden respectively by Bucquet, 2h. 12m. 19s., Lamberjack 2h. 25m. 28s., and Demester 2h. 30m. 38½s. These were followed by (4th) Beniot (Z.L.), 2h. 31m. 36s.; (5) Champoiseau (Peugeot) 2h. 32m. 55½s.; (6) Dejean (Adler) 2h. 47m. 40s.; (7) Fagard (Sarolea) 2h. 47m. 56s.; and (8) Cissac (Peugeot) 3h. 27m. 14s. The second best time was actually accomplished by Thomas on an Alcyon, his time being 2h. 24m. 33s., but owing to his having entered in the class for machines weighing less than 50 kilogs., he was disqualified, as before the start he strengthened his saddle and made extra fixtures to his fuel reservoir, thereby bringing him several grammes over the 50 kilogs. It has been suggested that under the circumstances he should have been placed first in the class for machines

weighing over 50 kilogs. This, however, would have been somewhat rough on Tabuteaux, who in this latter class, riding a Griffon machine, was given the first place with the time of 2h. 46m. 36½s., Yourassoff, on a Peugeot machine, being the only other classed in this category with 3h. 21m. 15s. The Griffon has, therefore, secured the premier position in both categories.

In the voiturette class, Wagner, on a Darracq, obtained first place in 2h. 46m. 32½s., beating Taveneaux on a Gregoire, whose time was 2h. 51m. 51½s. Wagner's victory was all the more creditable as he twice had bad times with tyres, and had therefore to make up considerable leeway. The only other starter in this class was Renoncey or another Gregoire, who retired early in the contest.

The circuit for the cars and light cars on Monday was 118·5 kiloms., the start being from Bastogne. The extreme points of the circuit after leaving Bastogne were Barriere de Champlon, St. Hubert, Recogne, Neuschateau, Habay, and back to Bastogne. This circuit had to be covered five times, making a total distance of 592·5 kiloms. Fourteen starters duly weighed in, the start being given at 6.30 a.m., the winner being ultimately found in Hemery on his Darracq car. Eight actually finished, these being in the order named as follows:—

		Time.			
		Total.	1st 100 kiloms.		
		h. m. s.	h. m. s.		
1.	Hemery (Darracq) ...	5 58 32½	0 57 3		
2.	Tart (Panhard-Levassor) ...	6 13 37½	0 57 11		
3.	Le Blon (Panhard) ...	6 22 56	1 7 45		
4.	Wagner (Darracq) ...	6 24 10½	0 55 18		
5.	Heath (Panhard) ...	6 24 20½	1 1 24		
6.	De Caters (Mercedes) ...	6 40 27	0 59 32		
7.	Duray (De Dietrich) ...	7 18 26	0 58 24		
8.	Montjoie (Darracq light car, 657 kilogs.) ...	7 52 11½	1 11 52		

By the figures for the first 100 kiloms. it will be seen that Wagner, on his Darracq, made the best time of 55m. 18s., giving an average of 108·499 kiloms. per

hour, and beating Crawhez's previous record of 1h. 2m. 25 $\frac{3}{4}$ s. Wagner's time for the first complete circuit (118.50 kiloms.) was 1h. 4m. 22s., and during the first hour he covered 109.2 kiloms.

The "Regularity Cup" for teams goes to the Darracq firm for the best combined performance, in addition to the win by Hemery in the big car class. Jenatzy, who was driving the Mercedes car, after covering three laps, abandoned the race owing to a tyre coming off and the rim being damaged. De Caters also had tyre troubles, and Gabriel (De Dietrich) on the first round smashed a wheel, precipitating the car into a ravine; Fabry (Itala), on the second round was placed *hors de combat* through a seized piston. Heath was unfortunate on the second lap in arriving at Bastogne just as the tyre staff were giving their attention to Wagner, thereby no doubt causing appreciable loss of time. Behr, on the C.G.V., broke his cardan shaft when starting, and Rougier deranged his clutch mechanism, so that altogether there were a large number of mechanical accidents.

Light Delivery Van Trials.—Entries for these trials which are taking place from September 20th to October 24th under the auspices of the A.C.G.B.I., have now been issued, and are as follows:—

CLASS A.—For vehicles designed to carry 5 cwt.

- | | | | |
|--|-----|-----|----------------------|
| 1. Alldays and Onions | ... | ... | Alldays. |
| 2. Simms Manufacturing Co., Ltd. | ... | ... | Simms-Welbeck. |
| 3. London and Parisian Motor Co., Ltd. | ... | ... | London and Parisian. |

CLASS B.—For vehicles exceeding 5 cwt., but not exceeding 10 cwt.

- | | | | |
|---------------------------|-----|-----|-----------------|
| 1. Wolseley Motor Car Co. | ... | ... | Wolseley. |
| 2. Alldays and Onions | ... | ... | Alldays |
| 3. De Dion Bouton, Ltd. | ... | ... | De Dion Bouton. |

CLASS C.—For vehicles exceeding 10 cwt., but not exceeding 1 ton.

- | | | | |
|----------------------------------|-----|-----|--------------------|
| 1. James and Browne, Ltd. | ... | ... | James and Browne. |
| 2. Wolseley Motor Car Co. | ... | ... | Wolseley. |
| 3. Milnes-Daimler, Ltd. | ... | ... | Milnes-Daimler. |
| 4. Dennis Brothers, Ltd. | ... | ... | Dennis. |
| 5. Simms Manufacturing Co., Ltd. | ... | ... | Simms-Welbeck. |
| 6. Thames Ironworks Co. | ... | ... | Thames. |
| 7. Bickford Burners Co. | ... | ... | Light Steam Lorry. |

CLASS D.—For vehicles exceeding 1 ton, but not exceeding 1 $\frac{1}{2}$ tons.

- | | | | |
|------------------------------|-----|-----|-----------------------|
| 1. Motor Car Emporium, Ltd. | ... | ... | |
| 2. Milnes-Daimler | ... | ... | Milnes-Daimler. |
| 3. De Dion Bouton | ... | ... | De Dion Bouton Lorry. |
| 4. Lacre Motor Car Co., Ltd. | ... | ... | Lacre Motor Lorry. |

The particulars of the contest we published in our pages some time ago, and it is hoped that these trials will prove of very great value from an industrial point of view. They will comprise 30 days' service of each vehicle, and daily examination by the judges, the conditions of the trials approximating as far as possible to those of ordinary daily service as required by a tradesman. There will be four centres from which the trials will be worked, viz., Oxford, Kidderminster, Leicester, and Cambridge. The entries close at 12 o'clock noon on Wednesday, August 23rd, by which time it is hoped that a number of manufacturers who have not already entered will have joined in assisting to the success of this very important contest. The judges who are willing to act in connection with these Trials are Messrs. R. E. Phillips, Mervyn O'Gorman, E. H. Cozens-Hardy,

W. Worby Beaumont, G. H. Baillie, and Lyons Samson, whilst Colonel Holden and Major Lindsay Lloyd will act in a dual capacity as judges for the club, and also for the purpose of advising the War Office Committee on Mechanical Transport regarding the diploma offered by the Army Council for the vehicle which is considered either as a whole, or in some details of its engines or other parts, most meritorious from a military point of view, and therefore likely to be of service, even though indirectly, to the Army.

Tourist Trophy.—The original date selected of Thursday, September 14th, for holding this tourist car race in the Isle of Man has now been definitely settled, after consultation with the Manx Highways Board. It was at one time feared there might be difficulty in regard to this date, owing to the trouble which might arise in connection with the harvest in the Island.

The race itself will consist of four complete circuits of the well-known Gordon-Bennett Eliminating Course, making a total distance of 208 miles 4 furlongs. The race will be run without any controls from start to finish. This will possibly render it necessary to erect foot-bridges at Kirkmichael and Ramsey.

The final date for the receipt of entries is Monday next, August 14th, and it is announced that two entrants have withdrawn, viz., Mr. J. Lisle and the Enfield Cycle Company.

Henry Edmund's Hill-Climbing Trophy.—It is proposed to run off this competition at the end of September or the beginning of October, probably on a hill near Worcester, situated in private grounds.

Daily Graphic Trophy.—In all probability this trophy will be contested in the Isle of Man the day after the Tourist Trophy Race.

THE Queen Mother of Italy has decided to offer a cup for international annual competition amongst touring cars. The contest, which will take place in Italy, will be chiefly governed by fuel consumption.

ARDENNES CIRCUIT.—Wagner, the winner in the Voiturette Class, at full speed on his Darracq car.

HERKOMER TROPHY.—Four Daimler Cars of the six vehicles constituting the British team for this trophy which last week we recorded as having crossed the Channel "en route" to Munich to compete in this contest. The photograph was taken immediately before the start of the team from London.

THE HERKOMER TROPHY.—BRITISH TEAM REACHES GERMANY.

(From Our Correspondent.)

Strasburg, Sunday Night.

FIVE days of sweet-running engines, inviting roads, wet weather, scarcely remarkable scenery, some fascinatingly interesting cities and towns, occasionally uncomfortable hotels, invariably good cooking, and above all else the best of good company—such is a summary of the story of the British pilgrimage to Munich to compete for the trophy which has been generously presented by Professor Hubert Von Herkomer, and has succeeded in eliciting no fewer than 101 entries from owners of private touring cars in most countries of the civilized world. The little company is proceeding on five Daimler cars, under the popular chieftainship of Mr. Edward Manville, who will act as a representative of the Automobile Club of Great Britain and Ireland, as well as the driver of his own 35-h.p. car, in the competition which commences on Saturday. The other competitors and members of the party are Mrs. Manville, Mr. Philip Dawson, and Mr. Hearman Ash, who will respectively drive their 35 and 28-h.p. Coventry-built machines, and Mr. Frank Rendle, whose "thirty-five" will be handled by Bush, of Bexhill, Brighton, and Blackpool fame, to name but a few of the series of his triumphs with Daimler touring cars. Next to him, we hold Mrs. Manville to be our trump card, in virtue of her extraordinarily skilful management of her machine, which is as a living thing in her hands. She is the only lady driver who will figure in the competition, the others entered having withdrawn.

We have been doing more sight-seeing than driving during the last five days, in consideration of the fact that the three days' reliability trial to follow the initial stages of the competition will prove sufficiently tiring work without practising non-stop runs all the way to Munich. Hence the greater part of our days have been spent in towns—and, be it whispered, feasting in leisurely fashion on the fat of the land in which we have chanced to be sojourning. What little time has not been spent in either of those agreeable ways has been

given, or the greater portion of it, to sleep, the odd hours remaining being occupied in short but sharp sprints in caravan fashion to the next pre-determined halting-place.

The run to the Kentish coast, the crossing just before the late gale, and the trip from Boulogne to Amiens are already beginning to grow misty in our memories. We have vivid recollections, however, of a sunset scene at Amiens, when, on arriving after a sharp shower, we beheld with something uncommonly like rapt admiration the ancient Gothic church of St. Vulfran's turned to a shining pile of light gold by the bright rays of the sinking sun. Only one other scene of greater beauty—a skyscape at sunset the following evening—has been vouchsafed us so far.

We have spent nights at Reims and Nancy, the hotel and motor-house accommodation of both towns being of the best, as it is here. The prettiest scenery, in passing through France on the roads chosen, was lost to us last night owing to the journey being made long after sundown, the reason being a series of punctures occasioned by one or other of the nails that are fast filling the bag in which we are collecting them. German territory was entered to-day, and as the real business of our trip may be said to commence from this point, as we have been unable to use our cameras owing to rainy weather; however, account of the competition, and the incidents arising in connection with it, must be held over till next week.

Glidden Cup.—This tourist car run appears to have been a success, bearing in mind the rules which were framed for the running of the contest, it being clearly defined that the run was not a race, but an enjoyable long distance tour for tourist cars, although the route selected, including the climb of Mount Washington, was not unnaturally one that was calculated to severely tax at times the powers of the cars. Of the 35 cars which started, 28 are reported as having finished officially, 12 days having been devoted to the tour, 4 on the outward journey, 4 on return journey, and 4 were spent at Mount Washington. The total distance travelled was 861.2 miles. The winner of the Cup is reported by cable to be Percy P. Pierce, who drove a 28-h.p. Pierce-Arrow car, whilst the others who are credited with having come through with clean records are the following, in which it will be noticed the White cars largely predominate:—A. A. Post (White), E. H. Fitch (White), Benjamin Briscoe (Maxwell), Albert L. Pope (Pope-Teledo), Charles E. Walker (Pope-Hartford), R. F. Coburn (Maxwell), S. B. Stevens (Darracq), George H. Tyrrell (White), and W. N. Eppig (White). A good deal of praise is being accorded to the behaviour of the tyres generally, in several cases these being reported to have gone through the entire run without any attention of any description.

French Commercial Vehicle Trials.—Considerable success has attended this event, which started, as we announced last week, on July 27th and ended on August 8th. With such a number of vehicles to look after the French A.C. have had their work cut out to keep the trials well under control, and Mons. Longuemare, who has been in charge of the consumption measurements, has possibly been the hardest of all hard-worked officials. Their arduous tasks, however, should bear most valuable fruit, well calculated to aid the industry from every point of view, both by providing reliable information as a basis for further development, and as a demonstration of the present state of this most important industry.

A characteristic French touch was given to the concluding scene at Paris, on Wednesday, by the massing

of the 48 vehicles which finished out of the 55 started at the Porte Maillot—which point they had been timed to reach simultaneously—and the formation of a procession to parade through l'Avenue de la Grande Armée, Champs Elysées, to the Jardin des Tuileries.

The mass of statistical information which must of necessity evolve from the holding of these trials, is not at present available from official sources; for the present, therefore, we shall refrain from publishing anything in the nature of detailed results until we are in a position to give our readers official data in the concise manner which it is our usual custom to tabulate such information. The unofficial figures would not only be useless but positively harmful to the competitors and misleading to the public.

● ● ● ● MOTOR BOATING.

BRITISH INTERNATIONAL CUP RACE.—"Napier II" at full speed in the Eliminating Trials off Sea View.
The Hon. John Scott Montagu, M.P., and Mr. Lionel de Rothschild, the entrants of the boat, are in charge.

The British International Cup.—No official announcement was made—as we stated at the time—immediately after the Eliminating Race which was held on Monday last week, in the Solent, and it was not until the end of the week that the committee definitely stated that they had selected Napier II, owned by the Hon. J. Scott-Montagu and Mr. Lionel de Rothschild, as the first British representative. Napier II was, it will be remembered, the only boat to actually complete the course, although she started about twenty minutes late. In order to select two other boats from the three other starters, the Club arranged another race, which took place on Wednesday, August 9th, in Southampton Water.

The result of this second trial is that "Napier" and "Competitor" will now, in the ordinary course—together with "Napier II"—represent England in the Arcachon Bay, when the B.I.C. Race takes place on September 11th. The following are the times of the boats for the full distance of 35 miles:—

1. Lord Howard de Walden's Napier, 1h. 47m. 40s. = 19'4 miles per hour.
2. Lieut. Mansfield Cumming's Competitor, 2h. 9m. 32s. = 16'4 miles per hour.
Brooke I. did not finish.

FOLLOWING the motor boat reliability trials which we record this week, came the Solent Regatta in connection with the visit of the French Fleet. On August 7th the events were controlled by the British Motor Boat Club, and the most important event was a scratch race of 40 miles for the "Entente Cordiale" Cup, a trophy presented by Mr. Walker Munro. Unfortunately for the interest in this event, neither "Competitor" (Lieut. Mansfield Smith-Cumming), nor Hutton II. started. Brooke I. again demonstrated the high speed of which she has already shown signs, and completed the course in 1h. 18m. 21'3s., which is equivalent to a speed of 30'6 m.p.h. (26'6 knots). Because Brooke I. did not finish inside the mark, the Cup goes to Napier II. (Hon. J. Scott-Montagu and Mr. Lionel de Rothschild), which took 1h. 29m. 53'3s. (23'2 knots), and the third best time was that of Lord Howard de Walden's Napier in 1h. 32m. 45'3s.

On the next day the Motor Yacht Club took charge of affairs, four events being down on the programme. In the first event Napier II. was unopposed, and in the second, Mr. Perman's Pallas won the handicap, while Mr. Stirling's Elginia, and Capt. R. T. Dixon's Gleione won the third and fourth events respectively.

BRITISH INTERNATIONAL CUP RACE.—"Competitor," Lieut. Mansfield Cumming's 35-ft. boat, travelling round the Eliminating Course.

MR. WILLIAM K. VANDERBILT, JUN., is reported to have offered a valuable cup for an international race of motor boats, to be run over a distance of 100 marine miles annually.

IN the contest for the President of the Republic's Cup offered in connection with the French Marine Week, Dietrich II. proved the winner, having covered the 12 kiloms. in 30m. 58s., Suzette was second in 42m. 22s., Mendelssohn third in 49m. 28s., and Phryne fourth in 53m. 42s.

Antiautomobilemonomania.—A sad instance of a bad attack of this form of incipient hydrophobia occurred to a man of the name of James Drewett, in the town of Nottingham, recently. Dr. Tressider, of Nottingham, was driving his motor car through a street in that town, when Drewett rushed into the road and threw himself in front of the car. The car was fortunately stopped just in time to avoid running over him, but when the doctor attempted to circumnavigate the maniac, the latter jumped up and slashed at the tyres with a knife. Dr. Tressider's chauffeur jumped down to stop this onslaught and was himself savagely attacked. Dr. Tressider immediately went to the chauffeur's assistance, whereupon Drewett produced a poker from under his coat, and attempted to crack Dr. Tressider's skull with it. It is alleged that Drewett was quite sober, and he has accordingly been remanded for the state of his mind to be enquired into. Lord Queensberry, Canon Greenwell, and Sir Ralph Payne Gallwey please note!

Among the Philistines.—While Commissioner Cadman, who is taking a leading part in General Booth's automobile evangelistic tour, was bringing "salvation" to Andover, in a motor car, and at a high rate of speed, he fell into a police trap, which alleged that that speed amounted to exactly 28 miles an hour. Commissioner Cadman will presumably "hear more" about this.

A SOMEWHAT original contest was also inaugurated during the week. Competitors were shut up in an enclosure, and at a given signal each had to make his way to his boat, fill up with petrol, and get away over a course of about 10 kiloms. Upon the return, each, after stopping their engine and making fast, had to again go into their enclosure, the first back gaining the prize. This was open to all classes of boats without distinction, and was secured by Perignon, who steered Dietrich II. Mendelssohn was second and Ketty third.

The Smoke Nuisance.—We are pleased to see that a resolution, strongly condemning the growing habit amongst a number of automobilists of allowing the exhaust gases to leave behind them a trail of filthy, pungent smoke, has been passed by the Expert and Technical Committee of the Automobile Club and endorsed by the General Club Committee. The wording of this resolution, which emphasises the remarks which we made last week and again draw attention to this week in the JOURNAL in regard to this growing practice, is as follows:—

That the Technical Committee expresses the opinion that except temporarily there is no excuse for allowing smoke to pour from the exhaust-pipe, and that a person driving a car should see to it before leaving the motor-house that any superfluous oil has been duly blown off before going on to the public high roads or into the streets of a town.

It also condemns the placing of the exhaust-pipe in such a way that it exhausts directly behind the car, so that when a stoppage occurs in traffic the exhaust is blown directly upon a horse or another motor vehicle immediately behind it.

THE convertible ambulance motor car which the King has presented to the Osborne House Convalescent Home for Officers is an 18-h.p. Siddeley, made by the Wolseley Company. Prior to being sent to its "home," it was taken by command to Buckingham Palace, and the King was driven round the grounds by Mr. J. D. Siddeley. His Majesty expressed his satisfaction with the car as being admirably adapted for the purpose intended.

BRITISH INTERNATIONAL CUP RACE.—"Brooke L" the powerful-engined boat entered by Capt. D. B. Corbet and Mr. Mawdsley Brooke, at speed off Sea View during the Eliminating Trials.

Six Days' Reliability Trial.—Recently we gave the particulars of the route to be covered, together with some other points of interest, in connection with this six days' trial from August 14th to 19th.

The trial, it will be remembered, is for tourist machines only, and the principle underlying the rules is that the test is one of reliability and not speed. There are to be hill trials, and on these speed will be taken into consideration.

The following is a brief summary of these routes :—

	Miles
August 14.—London, Edgware, Oxford (lunch), Cheltenham, Worcester	126½
August 15.—Worcester, Bromyard, Hereford, Gloucester (lunch), Cirencester, Bath, Bristol... ..	132
August 16.—Bristol, Weston-super-Mare, Taunton (lunch), Tiverton, Exeter	118½
August 17.—Exeter, Bridport, Weymouth (lunch), Bournemouth, Southampton	122½
August 18.—Southampton, Brighton (lunch), Eastbourne	120½
August 19.—Eastbourne, Bexhill, Maidenhead (lunch), Redhill, London	147½
Total	767½

The competing machines were due at the Motor House, 18, Down Street, on August 11th, between 10 a.m. and 4 p.m. for sealing and stamping. Three classes of certificates will be issued, and gold medals awarded to machines securing first-class certificates which are of sufficient merit in the opinion of the judges. The award of the certificates will be dependent on the marks earned for reliability (maximum 1,000) as shown by the performance of the machine, hill-climbing capabilities (75), brake power (50), accessibility (20), convenience (80), and condition of machine during and after trials (100). Speed under 15 miles per hour over any section of the route will entail loss of marks for reliability, at the rate of 1 mark for every 2 minutes or fraction thereof that the competitor may be late, with the exception of stoppages for tyre troubles, which are provided for by permitting the driver to make tyre repairs under observation without counting in the running time, beyond being debited 5 marks for the section in which the tyre repair is effected. Any competitor thus losing 120 marks under reliability in any one day will be disqualified from further participation in the trials. Several records will be taken for hill-climbing, for the award of marks, and pedalling will be permitted, but will be recorded, whilst the non-climbing of one special hill of an average character will entail a heavy penalty. Passenger machines fitted with a change-speed-gear and free engine clutch will be stopped on a hill, and must be re-started. Special tests will be made by the judges in connection with the brakes, and marks deducted according to efficiency, at the discretion of the judges. Stops for repairs or adjustments may be made during the day's run, and no marks will be deducted for this, provided that the competitor completes the section in which the stoppage occurs within the time allowed in his time schedule. But all repairs and adjustments must be made by the driver himself without any outside assistance whatever, and replacements must be made only from parts actually carried on the machine or the person of the driver. One hour prior to the official starting time each morning will be allowed for cleaning the machine, and effecting replenishments or adjustments. Any repairs necessary in the evening must be notified beforehand, together with the exact nature of the repairs required, when the observer will attend during such repairs.

THE London General Omnibus Company continues to add to its motor 'bus equipment, and 12 new motor 'buses, which are, we understand, to be run between the Law Courts and Cricklewood, will be started next week. As regards the prospects of the motor 'bus, the Secretary of the Company, who has been interviewed on the subject, is rather guarded in his utterances. According to him, the Company has 100 more outstanding orders, and if all these prove successful, the result will be to largely displace, he declares, the horse-drawn 'bus. Of this we have little doubt, but we learn with some surprise that a good many obstacles have been placed in the way of development by the London police, one set of motor 'buses being condemned for not having the petrol tank in the proper position, and this even in spite of the opinion of Mr. Worby Beaumont that it was all right. As the change required means the re-modelling of the whole chassis, the result is to delay some six cars being put in commission. That the General Omnibus Company expect considerably more development is shown by the fact that they are sending some 70 to 80 horse-'bus drivers to the Battersea Polytechnic to learn motor-car driving, and a considerable number to the works of the Lancashire Steam Motor Company.

One mark for every two minutes so occupied in repairing will be deducted. The machines will start each day at 8.30 a.m., except the last day, when the start is at 7.30 a.m.

Reliability Run to Carlow.—On Saturday last, the Team Race promoted by the Motor Cycle Union of Ireland took place, starting from Inchicore Bridge at 1 o'clock p.m. The run was 100 miles, marks being deducted for every stop on the road, with a stay of 40 minutes at Carlow. The event was confined to teams of three, and the judges for the contest were presented to the Union by the Hon. Frederick D. P. Robinson. At 1 o'clock the following were sent away by Mr. Coleman O'Connell :—

- No. 1 Team.—T. W. Murphy, W. Keating, L. Summers.
- No. 2 Team.—G. Mayne, W. H. Meredith, T. Howison.
- No. 3 Team.—W. Guilfoyle, A. C. Carey, C. Campbell.

W. Keating was early in difficulties, and did not get to Carlow, where all the others arrived in good times and reported non-stop runs, with the exception of Carey, who collided with a dog. The return journey was equally uneventful, Carey being again the victim of ill luck; and at 6.35 Mayne, Meredith, and Howison arrived at Inchicore, finishing a complete team. The time of arrival was as follows :—

			p.m.
G. Mayne ...	3-h.p. Singer ...	Non-stop ...	6.35
W. H. Meredith ...	2-h.p. Triumph ...	Non-stop ...	6.35
T. Howison ...	3-h.p. F.N. ...	Non-stop ...	6.35
T. W. Murphy ...	3-h.p. Singer ...	Non-stop ...	6.50
L. Summers ...	3-h.p. Triumph ...	Non-stop ...	6.50
A. C. Carey ...	2-h.p. F.N. ...	Two stops ...	6.53
W. Guilfoyl ...	2½-h.p. Liberty ...	Non-stop ...	6.59
C. Campbell ...	2-h.p. F.N. ...	Non-stop ...	7.6
W. Keating ...	2½-h.p. Ariel ...	Retired.	

"Motor Cycle" Cup.—The team selected by the Coventry Motor Cycle Club (the present holders) for this cup taking place on Saturday, August 26th, is as follows :—

- Class 1. Motor bicycles under 76 by 76.—V. A. Riley (Riley); F. Hulbert (Triumph); reserve, R. W. Ayton.
- Class 2. Bicycles over 76 by 76.—H. W. Duret (Singer); G. E. Roberts (Triumph); reserve, H. Williamson (Rex).
- Class 3. Passenger motor cycles.—A. Riley (air cooled Riley bicycle and trailer); E. W. Walford (water cooled Riley tricar); reserve, B. Yates (water cooled Humber-Olympia tricar).

At Rheims, on Sunday last, a contest for touring motor bicycles was held. The machines had to cover a distance of 230 kiloms. over a circuit of 76·7 kiloms. Fourteen entrants started, and the chief results were :—1. Driot (Alcyon), 4h. 3m. 45s.; 2. Lallement (F.N.), 4h. 50m.; 3. Gislain (Werner), 4h. 50m. 50s. Eight completed the course, the others abandoning the race.

At the annual meeting of the London Road Car Company, at Cannon Street Hotel, on Tuesday last, the Chairman, Mr. J. H. Moore, was even more guarded in his expressions than Mr. Kingham, the remarks he had made on a similar occasion previously having, he said, been utilised for the promotion of companies to run in competition with his own. Still, what he did let out is sufficiently striking. The takings of the Company during the half-year were a record, showing an increase of 411,343 passengers carried, and an increased weekly average of receipts amounting to 5s. 5d. per car. "In that result the first fruits of the motor 'bus were to be traced." In their new type of conveyance they had carried over a million passengers, and, though the number of motors in service was relatively small, their greater earning power had had some considerable effect in swelling the weekly average receipts. Development, it appears, has been in the case of the London Road Car Company to some extent interfered with by the fact that they have had trouble in obtaining delivery of 'buses ordered. From the Chairman's remarks it is to be concluded that the motor 'bus outlook is practically all that can be desired, but that he is purposely refraining from saying so.

Motor Car Commission.—The full terms of the reference to the Royal Commission on Motor Cars, just appointed at the instance of the President of the Local Government Board, are as follows :—

To inquire and report as to :—

- (1) The working of the Motor Car Acts, 1896 and 1903, and of the regulations under them ;
- (2) The law and practice in relation to motor cars in the principal foreign countries ;
- (3) What amendments, if any, should be made in the Motor Car Acts, and the regulations under them ;
- (4) The injury to the roads alleged to be caused by motor cars ; and
- (5) Whether any and, if so, what additional charges should be imposed in respect of motor cars, and how any money thus raised should be applied ;

with power to issue an ad interim report on the first three heads, if that course should appear desirable.

BRITISH INTERNATIONAL CUP RACE.—The two Napier boats waiting off Sea View for the Eliminating Race. "Napier II (No. 1) was entered by Mr. Lionel de Rothschild and the Hon. John Scott Montagu, M.P., and "Napier" (No. 2) is Lord Howard de Walden's well-known boat.

PRESIDENT LOUBET, as is well known, was up to comparatively recently, if not an active opponent, at any rate a very platonic friend of the automobile movement. It is enlightening, therefore, to find that he has recently purchased a 25-h.p. car, built by Charron Girardot and Voigt.

THE danger of instructing police to adopt illegal methods has been trenchantly illustrated in the neighbourhood of Chicago. Some of the criminal classes have heard about policemen stopping motor cars by firing at their tyres, and recently a motor car party was stopped in this manner and "held up," being ultimately relieved of £400 in notes and cash and a quantity of valuable rings, watches and brooches.

A remarkable feature of the Brighton Motor Meeting was the large quantity of Daimler cars which took part in the races, and which were everywhere in evidence in the neighbourhood. The above is a unique photograph of the special garage for Daimler cars which it was necessary to secure for the occasion, the sixteen bonnets peeping out of their various houses forming a striking picture.

that Brighton is asking for more motorism, recognising, no doubt, the good that the automobile movement is doing to the town. The *Brighton Gazette* suggests that the Town Council should set apart (say for three hours daily) the Madeira Walk entirely for the use of motorists.

Our contemporary is getting very angry with the Sussex police for the elaboration of silly police-traps which are, to a large extent, keeping motorists out of the town who would otherwise go there, and is even more angry, and rightly so, with the Sussex magistrates, to whom our contemporary suggests that they hold the view that "all men are liars—except the Sussex policemen."

An echo of the Delhi-Bombay Trials comes with the above photograph of the Trophy presented by the Maharaja of Mysore, which was won by Mr. B. H. Hewitt on his 8-h.p. De Dion car. The trophy which is of solid silver, and weighs 7½ lbs., bears the following inscription:—

"Delhi-Bombay Trials,
Christmas, 1904,
The Mysore Trophy,
For the car in the best condition
on the conclusion of the Trials.
Won by B. H. Hewitt, Esqr., on his 8-h.p. De Dion car."

WE sympathise to a certain extent with our contemporary, the *Mid-Cumberland and North Westmorland Herald and Penrith, Appleby, Kirkby Stephen, Keswick, and Alston Advertiser*, not only on account of its long name, which is an infliction that few newspapers deserve, but also on account of the very ridiculous and humiliating position into which it has allowed itself to be dragged by unreasoning antiautomobilemonomania. The *Mid-Cumberland and North Westmorland Herald, &c., &c., &c.*, declared in its issue of June 17th that a car numbered AE 1 had rushed past a horse and cart, causing an accident in which the driver of the horse and cart was injured, and that the motorist, regardless of the accident, had proceeded on his way without rendering any assistance. Mr. Thomas Butler, of Charnwood, Bristol, the owner of the car thus numbered, was afterwards charged at the Penrith police court on this count, but the case against him was dismissed without any evidence having been called on his behalf. Mr. Butler is naturally indignant about the libel, but has very magnanimously agreed to accept an apology on the understanding that the newspaper pays his costs and contributes £3 3s. to the Penrith Cottage Hospital, so out of evil to this small extent good cometh. The *Mid-Cumberland Herald &c. &c. &c. Advertiser* may consider it has got off very cheaply. The whole business is a very shocking example of the way in which any lie is believed against a motorist and, without adequate examination, given publicity and circulation. The anti-motorist knows but too well the value of the advice "Give a lie a good start and nothing can catch it."

It would appear that the result of the motor car meeting at Brighton has been

To what absurd length the police will go to trump up cases against motorists was illustrated recently at North Holland, in Lincolnshire, where a summons was heard against a motor bicycle rider for not having provided his "trailer" with a number. The ground of the prosecution was that he was towing an ordinary bicyclist with a rope. Without going into the precise legality of the questions involved, it must be admitted that such a prosecution is an absurdity from the commonsense point of view, and we are, accordingly, glad to learn that the magistrates dismissed the case. The police might, on the same grounds with equal justice, summon every car-driver to whom (probably unknown to himself) a bicyclist is holding on behind. We suppose we shall see this next!

The ingenuity in attracting attention displayed in a large number of shops is ever being exemplified in one direction or another. An extremely clever device of this character is seen in the photograph which we reproduce above, which has been placed at our disposal by the Kodak Company, the well-known manufacturers of photographic apparatus and material. The picture shows an unique design for a window display. The whole of the "motor car" is the result of skillfully assembling a few Kodak cameras and parts of Kodak appliances. Apart from the dolls nothing but articles of the Kodak Company have been introduced.

The Thornycroft motor launch "Banzai," upon which recently the Duke and Duchess of Argyll had a short cruise in the Solent, from Cowes to Ryde and back to Cowes. This speedy boat is of the cruiser racer type, 30 ft. in length by 5 ft. 9 in. beam, whilst she only draws 18 ins. of water. She is fitted with a 20-h.p. Thornycroft marine motor giving a speed of about 17 m.p.h.

MR. RUFUS ISAACS, K.C., M.P., was amongst the list of members elected to the A.C.G.B.I. last week.

A CHANGE of title is proposed by the "Motor Van and Wagon Users' Association," to the "Motor Van, Wagon and Omnibus Association."

DR. EDMUND WARRE, late headmaster of Eton, is to be presented by his "Old Boys" with a 15-h.p. Rolls-Royce car. The Hon. C. S. Rolls, the head of the firm of Messrs. C. S. Rolls and Co., is an old Etonian.

IT appears that the motor 'buses which were running between Tunbridge Wells and neighbourhood have been taken out of service owing to the closing of the South Eastern Bridge to traffic of this kind. They have been sold at a high price to the Brighton Omnibus Company pending the reconstruction of the bridge, so this sale does not in any way suggest that the Tunbridge Wells service was a failure, as there have been attempts in some quarters to represent it.

OUR congratulations to Mr. Eric Chaplin on his marriage to Miss Gwladys Wilson of Warter Priory. Mr. Chaplin, most of our readers know, is a prominent member of the Automobile Club and a member of the Public Policy Committee; while Miss Gwladys Wilson has been for a long time a noted automobilist, being one of the first ladies in this country to drive her own car. The wedding, which took place at St. James' Church, Warter, was a very picturesque function.

THE London County Council are proceeding to make experiments on the Thames Embankment (as they will not now, for some time at any rate, be tearing it up to lay their tramlines) with various forms of tarmac. There is to be 100 feet of granite tarmac, 100 feet of limestone tarmac, and 100 feet of slag tarmac, laid down by Messrs.

Constable, Hart, and Co. This ought certainly to enable a good idea of the wearing qualities of the three different methods of road treatment to be formed.

A JUDGE like Mr. Justice Kennedy does not attach the same sacro-sanct character to police evidence that is the custom of many justices of the peace, and he pointed out in a recent case heard by him at Liverpool Assizes, that if a motor car which had run into an unlighted vehicle had been really exceeding the speed limit as the police maintained, there would not have been even the relics of the cart with which it collided to pick up. In connection with this case Mr. Justice Kennedy also delivered himself of the *obiter dictum* that it was a strange circumstance that whereas a motor car which does not require protection from behind carries a light at the rear, a vehicle which may be readily overtaken is not compelled to do so.

AMONGST the outings arranged for the officers of the French Fleet on their visit to this country are a number of motor-car trips through the New Forest, arranged by the Hampshire Motor Union in co-operation with Admiral Sir Douglas Brownrigg. A large number of the cars which conveyed the Naval visitors were supplied by the Hampshire Club, though some were furnished by other amateurs. The first of these outings took place on the 10th and others arranged were on the 11th, 12th and 13th.

THE Metropolitan Asylums Board are adopting the motor ambulance, and their ambulance committee is now engaged in considering the question of tenders for chassis suitable for ambulance carriages. The form of tender stipulates that the horse-power should be from 12 to 16, and the engine as free from noise and vibration as possible. A tender for a petrol driven chassis of £455 is recommended for acceptance, and Colonel Crompton, mechanical adviser to the board, has recommended the hiring of a complete electric-

In connection with the Kiel Regatta we recorded that two first prize cups were secured by Lord Howard de Walden's "Napier" motor boat. These we are able now to reproduce above, the one on the left being the Daimler Motor Company's Cup run for on June 29th, which "Napier" secured with a time of 1h. 10m. 38s., at an average speed of 22.1 knots per hour. The Cup on the right was the Kiel-Travemünde Prize on June 30th, presented by Herr Felix Simon. "Napier's" time for the course was 5h. 20m. 18s.

COMMERCIAL POINTS.

DUNLOP motor cycle tyres were again successful at the Brighton race meeting, W. Genn winning the Tourist Handicap from scratch on his Minerva machine, which was shod with Dunlop tyres.

THE Lancashire Steam Motor Company, of Leyland, have received an order for four petrol motor-driven tower wagons for the Belfast City Tramways. These machines will be speeded up to 15 miles per hour, the chassis of which will be identical in every respect to the Company's standard 34-passenger petrol motor omnibus, that is, fitted with the Leyland-Crossley engine and transmission, and 5-inch solid rubber tyres on the front wheels and twin 5-inch solid rubber tyres on the back wheels.

DUNLOP motor tyres had a high time during the Brighton motor races. Twelve first prizes, we learn, were secured by cars shod with these tyres.

The Tyre Trade.—As an example of the tremendous growth in the tyre trade in these days of the omnipresent motor, we hear that Messrs. Grose, manufacturers of the non-skid band tyres, of Northampton, have just acquired warehouses standing upon an area of over 33,000 sq. ft., with buildings three stories in height. They are just opposite their present premises, which will be kept on as usual. In the new buildings one room alone is 150 ft. in length.

At the Royal Lancashire Agricultural Society's Show at Liverpool, Messrs. T. Coulthard and Co., Limited, of Preston, for their Class "K" vehicle were awarded the medal (the only award) for the best 5-ton vehicle.

It was recently announced that the Motor House of Euston Road had purchased a stock of 60-h.p. Mercedes, and we now learn that the greater part of these have been disposed of, amongst the most recent purchasers being His Grace the Duke of Manchester, who has secured one of these high-class machines.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

24164. 8th November, 1904. Improvements relating to Explosion Motors. The Société des Camions Automobiles Moteurs, Dufour, Nyon, Switzerland. The object of this invention is a regulating device for the purpose of cutting off the supply of mixture to the engine whenever the speed exceeds a certain limit. There are four figures. Fig. 1 is a part sectional elevation showing only one cylinder of the motor; *a* is the crank-chamber containing the cranks, to which chamber are bolted the cylinders, the cylinder, *c*, being shown in section; *d* is the piston. The cylinder cover, *f*, forms a valve-casing containing the inlet valve, *g*, and the exhaust valve, *h*. The inlet channels, *g*¹, are connected by means of pipes (not shown) with the branches, *i*¹ and *i*², of a valve-casing, *i*, containing the valve, *j*, the branch, *i*³, of which is connected to the carburettor.

The port, *k*¹, in the cover, *f*, is for the ignition-plug. The valve, *j*, is operated by mechanism in the casing, *a*¹, on the side of the crank-chamber, *a*. The grooved sleeve, *k*, slides on the crank shaft, *b*, and engages the ends of the bell-crank lever weight. The arms, *m*¹, of the forked rocking-lever, *m*, engage in another groove in the governor sleeve, and the lever is pivotally connected to a bracket, *m*². To the end of the forked lever, *m*, is fastened a spring, the tension of which is adjusted by a screw, which resists the action of the governor weights. On the cam, *n*, secured to the shaft, *b*, rests the end of the lever arm, *o*, pivotally connected at *a*² to the casing, *a*¹. To the end of the lever, *o*, is connected a piece, *p*¹, jointed by the link *q*, and the arm, *q*¹, to the arm, *q*², also pivotally connected at *a*². The free end of the lever arm, *q*², falls into the groove in the sleeve,

k, but the free end may reach an eccentric part, *k*², when the latter is shifted by the governor. Above the trip piece, *p*¹, is a slide, *r*¹, one end of which passes through the wall of the casing, *a*¹, and bears against the stem of the valve, *j*. When the lever, *m*, is in its normal position the trip piece, *p*¹, engages a slide, *r*¹, but when the sleeve, *k*, is shifted by the governor the end of the arm, *q*², is operated by the eccentric part, *k*², of the sleeve, so that by the arm, *q*¹, and the rod, *q*, the trip piece, *p*¹, is disengaged from the slide, *r*¹, and the parts operate without actuating the valve, *j*; *s* is the half-speed shaft. July 20th, 1905.

PASSING EVENTS.

The Campaign.

THE campaign inaugurated by the Automobile Club, for providing evidence for the Royal Commission on the Motor Car Acts, to which we referred last week, is one in which every automobilist must necessarily feel the profoundest interest. The whole future of the pastime, and the whole future of the industry on which it depends, are bound up with it, and the same remark applies to the case of those who are interested in automobilism on its business and commercial sides. To conduct the campaign, and to carry out the propaganda necessary for obtaining, examining, and marshalling the necessary evidence, money, and plenty of it, is absolutely indispensable. Automobilists have already commenced to respond to this appeal, but they can scarcely respond to it too widely or too generously. The preparation of the automobilist case will involve the employment of the highest class of skilled ability, and that is the most expensive commodity that money can purchase. When we call to mind that motor car owners have been collectively fined to the amount of £218,000 during the past year owing mainly to the imperfections of the existing Motor Car Acts, and that the evidence placed before the Commission will mainly determine the lines of future legislation, it is almost superfluous to add another word. Every car

owner in the country, therefore, ought, if he possesses the most rudimentary foresight, to contribute to the fund according to his means. We hope that subscriptions will come in freely and handsomely, not only for the reasons advanced above, but also because the effect produced by failure on the part of automobilists to contribute adequately to a propaganda in which the future of the whole movement is involved, cannot fail to produce a disastrous impression on the mind of the public. No one will feel sympathy for, or will support a movement which either fails to recognise, or will not support, its own most pressing and important interests.

The Swan Song of the Echo.

THERE is or was an ancient legend to the effect that the swan—a bird not remarkable, as a rule, for its vocal powers—blossomed forth in the hour of death into rapturous melody. Since last week the *Echo* has ceased from troubling, but just before its demise it produced a monumental effort of Ananiasism by which, at any rate, it deserves to be remembered for a short time to come. The effort, of course, took the form of a report of a motor car outrage or tragedy (whichever expression may be preferred), of which the victim (to excite greater indignation) was represented as an ancient and venerable sandwich man. So circumstantial was the account that the *Birmingham Post* swallowed it whole, and on May 27th last appeared with the following:—

“MAN KILLED BY A MOTOR CAR.—In the thick of the traffic in Oxford Street, London, yesterday afternoon, an aged sandwich-board man was knocked down and killed by a huge motor car. The unfortunate old man, carrying advertising boards back and front, was walking along the roadway close to the pavement in the direction of Queen's Hall when the car, shooting out from behind the press of vehicles, caught the edge of one of his boards. Before the motor could be stopped he was dragged underneath, and the two rear wheels passed over him, causing severe internal injuries, from the effects of which he died on the way to the hospital.”

The secretary of the Motor Union wrote to the *Birmingham Post* pointing out that the London police knew nothing about this terrible accident, and so elicited the information that the original source was the *Echo*. All that could be learned from the *Echo* by correspondence was that the report was supplied to them by “one of their regular men,” and, though again asked for particulars as late as July 6th, the *Echo* maintained a discreet silence. Shortly afterwards, the paper's appearances came to a sudden conclusion, and the “regular man” is probably a drifting denizen of Fleet Street, with plenty of time on his hands. The *Echo's* end is a salient example of the operation of the law of “the survival of the fittest” with its corollary of the “demise of the unfit,” and we hope it may serve as an awful example to journalistic disciples of Ananias to refrain from employing their special gifts for embittering the automobile controversy!

A Comedy of Errors.

ANYONE who is anxious to understand what is going to be the method of conducting the Tourist Trophy Race in the Isle of Man next month, and who attempts to obtain the information he desires from the current number of the Automobile Club Journal is sincerely to be pitied. The rules and regulations governing this highly important event require in any case a certain amount of careful study, and many an automobilist, and certainly many an average journalist, has been in

something of a quandary to understand the bearings of the whole case—recognising which features of the situation, we have devoted a good deal of time and trouble to its elucidation. The last number of the Club Journal, however, muddles the whole business up with a degree of triumphant confusion which would do honour to the best nonsense book ever composed by Lewis Carroll.

The issue of the Club Journal referred to contains information about:—

1. The Tourist Trophy Race.
2. The Tourist Trophy Course in the Isle of Man.
3. What the Races Committee, the ultimate authority in the matter, has decided shall be done.

Will it be believed that the editorial column calmly states that the Journal reproduces elsewhere “the itinerary of the route as officially given, together with the lengths of the various controls,” and at the same time insinuates a criticism of the club authorities to the effect that they have not hitherto got the distance out right, and that the course measured by the Ordnance Survey sheets is 52½ miles, while the committee of the club, which has calculated the distance, that is to say, the authority under which the Club Journal staff act, is stated to have made out the distance as 51 miles, 7 furlongs!

The contour of the course, which is reproduced by the permission of an esteemed contemporary, really refers to the course for the Eliminating Trial for the Gordon-Bennett Race of last year, and marked on it are a number of controls, hill-climbs, and places where speed tests are to be conducted, just as if these features formed elements in this year's Tourist Trophy. If anything could add to the piquancy of the situation it is that the criticism of the club authorities by the Club Journal has probably also been reproduced “by the kind permission of” our contemporary.

On another page of the same issue of the Journal, we find reproduced the decisions of the Races Committee in regard to the Tourist Trophy, and there it expressly states that (1) the race will consist of four complete circuits, making a total of 208 miles 4 furlongs, and (2) *that the race be run without controls.*

Ne Sutor Ultra Crepidam.

THIS sort of thing comes from the shoemaker refusing to stick to his last. It was a good old motto that advised him always to do so. The Club Journal has got quite enough on its hands if it will really content itself with seeing that it furnishes *accurate* and *consistent* information about the proceedings and doings of the club and its allied bodies, the events which it organises and the propaganda with which it is concerned. That it kicks over the traces in the way we have described above, and does not deal effectively with subjects which form its own proper province, is palpably due to its staff attempting to do too much and intervening in subjects with which it is quite improper that it should deal at all. In the same number of the Journal, we have a selection of trade items which appear to be inserted quite without any editing, and a technical article on the subject of electrical ignition, which would probably not have been inserted at all had the staff responsible for its appearance been adequately acquainted with the history and present position of the subject. For it describes as a novelty a system of electrical ignition substantially identical with one introduced a year or two ago by another firm.

Some months ago the club committee agreed to permit the insertion of certain carefully restricted items of trade information; but the "items" to which we refer above can hardly, we think, be fairly regarded as falling into this harmless category. The Club Journal has quite enough to do if it will stick to its own last, and provide the official information which is wanted, without venturing into subjects in which, as this flagrant instance shows, it is likely to find itself egregiously at sea, but when the results of such adventures outside its proper sphere have the result of interfering with the correctness of the official information which it is its proper and undisputed sphere to supply accurately and intelligibly, the situation ceases to be a joke.

* * *

A Matter for Sympathy.

Now life is short, and it is particularly short for all who wish to keep themselves adequately abreast of the automobile movement. Imagine the confusion that might well result in their minds from this magnificent muddle. Many people, as it is, are far from clear about the Tourist Trophy. They should be justified in looking upon the Club Journal as a broadsheet from which they can learn, at any rate, salient official *facts* in regard to the club's own automobile events, and here they find themselves with one breath informed, both that the contest will be run off *without* controls, and there *will be controls* at various specified points, while at the same time they are left to infer *both* that there *will be* speed contests on the flat and hill-climbing competitions, *and* that the event will be run *without any of these refinements*. If any confused automobilists, under the circumstances, jump to the conclusion that they have left the realms of sober fact for those of the theological controversy, they will be very little to blame.

It is very funny, no doubt. A muddle always is for those who know their way through it. But we submit, with all deference, that the Club Journal does not exist for the purpose of muddling up innocent members of the club and confiding journalists, and that if the result of its activity is to do so, it is producing darkness where it ought to be producing light. It is certainly making the automobile movement look ridiculous when the official organ of the leading automobile body in the country produces such an "Alice Through the Looking-Glass" comedy of errors on a question in regard to which it should be the impeccable source of reliable information.

* * *

More Smoke.

MR. DENMAN, the Rhodamantus of Marlborough Street, had, we learn, a batch of summonses (nice word batch! particularly in connection with summonses) before him on Monday last, which were taken out against motor car owners for driving cars which did not, "as far as possible, consume their own smoke." Under the inspiration provided by the unconsumed smoke, Mr. Denman became for once almost facetious, and suggested that if the smoke came out in front under the drivers' noses, instead of behind under the noses of the British public, something would very soon be done to stop it! No doubt it would and it ought to be done at once. We have dealt with this question at length in a former issue, when we pointed out that the nuisance both could and should easily be abated. At the same time, we

question whether summonses taken out on the lines referred to above are legal. If a motor car emits smoke or visible vapour from some temporary or accidental cause, it does not cease to be a "light locomotive," and to emit smoke or visible vapour temporarily or accidentally is not an offence under the Motor Car Acts. A factory chimney (or its owner) can be proceeded against for "not as far as practicable consuming its own smoke," but there is no such charge, as far as we are aware, against a motor car. If an automobile is so constructed as to emit smoke or visible vapour regularly and necessarily, it is a traction engine, and should be proceeded against as such. Mr. Denman adjourned the summonses, probably with a view to acquainting himself with the legal aspects of the question, and this suggests that he is in some doubt on the subject. At the same time, we repeat that we trust that automobilists will not take advantage of the confused state of the law on the subject, but will do all they can to get rid of the trouble, as the emission of smoke irritates the public, and cannot possibly have any other result than to affect the automobile movement prejudicially.

* * *

"Compensation for Disturbance."

THE last half-yearly meeting of the Great Western Railway Company will probably be memorable in the history of the automobile movement when the story of its early development is written in years to come—for it provides, we believe, the first special recognition on the part of a railway company that the motor car is exercising a distinctly competitive effect on passenger traffic. The first-class passenger receipts for the six months dealt with have displayed a falling off of £4,401, and it was distinctly stated by Mr. Baldwin, who filled the place of chairman, that he believed the falling off to be directly due to what he was pleased to call the "present craze for motoring." The word "craze," of course, suggests that the devotion to the new locomotion as a means of travel will not last. On that point we have no forebodings. The conditions of travel by automobile are so healthful and attractive that we simply refuse to believe that people who have become accustomed to them will ever return, *unless compelled*, to the process of being made into parcels, and carried from point to point like packages, which was Ruskin's description of railway travelling. It is a curious thing that the chairman made no allusion to the corresponding profits obtained from the motor 'bus services which the Great Western Railway has been so enterprising in establishing, or what is perhaps more to the point, the profits which the company may expect to derive from this source in the future. If receipts of one kind are diminishing owing to automobilism, automobilism at the same time provides the railway companies with the means for recouping themselves. Let them still further develop motor 'bus services to outlying districts, as so many of them have already been doing, and they will probably find that their total receipts will increase instead of diminishing, while the general health and happiness of the travelling community will be very materially improved. The great railway companies are in a splendid position for organising and financing extended road motor car passenger services. Let us hope the beginnings that several of them have made will lead to extensive development in this direction.

AUGUST 19, 1905.]

THE AUTOMOTOR JOURNAL.

1029

with decorations, were drawn up with the obvious design of receiving somebody, and as the English visitors stepped forward, they found themselves among the chief honorary officers of the Bavarian Automobile Club. A more courteous reception could not be wished for, yet there seemed a strange air of hurry about the matter of handshaking and a desire to utter an adaptation of the familiar request, "Parse along, pleeze." Sound of feet in the rear caused the Britons to turn their heads, and revealed the fact that the Grand Duchess of Mecklenburg-Schwerin and Prince Ludwig Ferdinand were approaching. Then it dawned upon the visitors that all unwittingly they had nearly been the occasion of marring a royal reception. They had not proceeded very far into the dinner garden before Professor Herkomer espied them, and gave them a characteristically hearty welcome. "Oh, if you only knew how honoured I feel, at such a splendid band of motorists having come over to try for my trophy, and with the cars of the very make that I have always used myself," he exclaimed. "I should so like to see you win it; I should, indeed."

The exhibition of the competing cars at the Beissbarth

It is a pleasure to be able to record the well-earned tribute paid unhesitatingly to the British workmanship and design. When the judges inspected the cars as to beauty and general suitability, they were a shorter time discussing the Coventry-built machines than any other car seen in the Exhibition, and gave maximum marks for all mechanical features and for simplicity and accessibility, while despite the fact that the cars had come by road from London in extremely dirty weather, only four marks were docked from the highest possible number concerning the condition of the coachwork, in connection with which it should be pointed out that more than half the cars had come straight from the carriage builders to the exhibit.

Sheer luxury would appear to be the dominant note in regard to the greater number of cars competing. For instance, the Limousines contained electric light, card tables, adjustable chairs, and all manner of little refinements that are, in reality, contrary to the spirit of motoring, while Monsieur Cuenod's 40-h.p. Martini, fitted with a Cape cart hood, was presumably designed with a view of dispensing with home life and hotels.

HERKOMER TROPHY.—A competitor taking a dangerous curve in the Kesselberg.

autohalle, opened the following morning, when as fine a collection of luxurious touring cars as one could wish to set eyes on was to be seen. The Benz, Opel, Ader, Mercedes, De Dietrich, Peugeot, and Martini, being the machines most numerous represented in the first really important international event designed especially for the private owner. Unhappily, the Napier car entered did not put in an appearance; but the British industry was amply and worthily represented by the five Daimler cars, owned respectively by Mrs. Manville, Mr. Edward Manville, Mr. Philip Dawson, Mr. Frank Rendle, who all have 35-h.p. models, and who are all handling them themselves save the last-named gentleman, who will trust his steering wheel to Mr. Albert Bush; while the fifth car is Mr. Herdman Ash's 28-h.p. model of the same make, which has come to be nicknamed the "hanger-on," because since it took the road for here at Shaftesbury Avenue, more than a week ago, it has never once been "left," running with a reliability that somebody described as positively irritating.

The depression of half-a-dozen buttons in the side panelling release sundry supports which, as they drop into position, compose a couch on which a king need not scorn to recline. A still more novel device on this car, however, was the siren, guaranteed to startle at 12 kilometres against the wind and at 20 kilometres with the breeze in its favour, so that when the moments become a matter of pressing importance to the modest motorist, it will be only necessary to turn on the weird instrument while passing Staines, for instance, and the policemen regulating the traffic at Piccadilly Circus and the Mansion House would immediately hold up the traffic and keep it so until after the passing of the man with the siren.

From "Munching," as the British mechaniciens insist on calling this city, the run to the Kochel See, 65 kiloms. away, is one of the prettiest that has been seen on the tour. This was the scene for the opening of the proceedings on Saturday, when the cars competed in the hill-climb on the Kesselberg towards Urfeld. At least,

The speed trial on the flat has taken place to-day, in the Forstenrieder Park hard by. The enclosure is a sort of flat heath land, with a good road containing some fairly sharp bends, which, however, did not prove obstacles to fast running. There is less occasion to dwell on the results here, as the more noteworthy are set forth elsewhere in this issue. Suffice it to set on record that the weather was as fine to-day as it was wet and occasionally overcast yesterday.

The final and most important stage of the competition will be entered upon to-morrow, when the run to Baden-Baden will be undertaken by a route measuring $222\frac{1}{2}$ miles.

THE Herkomer Trophy Contest is open to tourist cars only. The rules require that each car must have seats for four and be fully equipped as a tourist car. The competition consists of three parts:—(1) Appearance, coachwork, and mechanical parts; (2) Speed trials (two days) (*a*) on the Kesselberg Hill over 7 kiloms, (*b*) on the flat in the Forstenrieder Park, 6 kiloms., near Munich; (3) A tour through South Germany from Munich to Baden-Baden (357·7 kiloms. = 222·26 miles) on the first day, Monday; from Baden to Nürnberg (328·1 kiloms. = 203·87 miles), on the second day, Tuesday; and from Nürnberg back to Munich (236·9 kiloms. = 147·204 miles) on the third day, Wednesday; total, 922·7 kiloms. = 573·35 miles.

In the speed trials the cars are classed by h.p., viz. :—(1) Cars over 60-h.p.; (2) Up to 60-h.p.; (3) Up to 32-h.p.; (4) Up to 16-h.p.

HERKOMER TROPHY.—Professor Herkomer a keen spectator of the contest.

it was called a hill-climb, but in reality it was a study in corner work, the course consisting of a succession of curves having no more severe gradient than 1 in 15, and the mean rise being 1 in 20, a degree scarcely sufficient to slow the powerful touring cars that composed the great majority of the machines entered. Presumably, therefore, it was the cumbrousness of the luxuriousness of the coach work, added to the greasiness of the road surface after a night of drenching rain, that was the factor which contributed to the disappointingly slow speeds. There was also another reason for not taking any risks and overstraining mechanism of the cars, namely, that the marking in connection with the hill-climb was of a purely negative sort, only half a mark being deducted for every whole minute occupied in achieving the climb, which had been reduced in length to a fraction under four miles by leaving out the downhill course on the fringe of the Kochelsee.

There was absolutely nothing in the way of a smart start until more than half the cars had been sent on their way, and Mrs. Manville's turn came. She got away with characteristic promptness, and cheers of the onlookers, who had been all agog with curiosity from the opening of proceedings to see how the only lady driver would handle her machine. As the 35-h.p. Daimler started away gathering speed as curve after curve was approached, it was very noticeable how perfect was her judgment in accommodating the speed of the car exactly to achieve the limit without allowing side-slipping to occur. Moreover, the well-known amateur showed her experience and judgment in the points at which she changed speed, and the address with which she did it. Until the Daimler cars came along there had been practically nothing in the nature of speedy driving, but the example set seemed to improve from that point onwards, and the performances of the representatives of other cars became inspired.

HERKOMER TROPHY.—Climbing the Kesselberg.

Part of the Kesselberg Road.

A viaduct half-way up the Kesselberg road.

HERKOMER TROPHY AND BLEICHRODER RACE.

Marks are awarded as follows:—In the Förstenrieder Park each minute counts a mark. Seconds and fractions of seconds count the sixtieth part of a mark. The awards are the same for the Kesselberg climb, only here the run counts twice. The total performance of the speed trials will be given by the total of the marks.

Example: Run in the park in 8m. 10s. = $8\frac{10}{60}$ marks. Kesselberg run in 14m. 12s. = $14\frac{12}{60}$ marks. Total:

$$8\frac{10}{60} + (14\frac{12}{60} \times 2) = 36\frac{34}{60} \text{ marks.}$$

Each car during the tourist run has to carry a "controller." Adjustments and repairs may be carried out, and the run is not a speed test, but one of general reliability, a minimum and a maximum time, however, being fixed for each day's journey. Competitors may stop *en route* voluntarily, but unavoidable stops, repairs, part changing, &c., are noted and count against the reliability of the car by means of a series of added marks, the winner being the one with the smallest number of marks.

These marks are as follows:—A total of 36 for the three days is debited to each car, and *additions* are made for (a) repairs and adjustments 1 mark per minute; (b) changing parts for the first time 10 marks daily, the second time 15 marks, the third time 20 marks, in addition to repair time marks; (c) water replenishment on road first time 10 marks daily, second time 15, third time 20, and marks for time occupied; (d) tyre repairs, 3 marks changing tube, 6 marks for outer cover, besides the marks for time.

In the appearance competition a maximum of 36 marks is awarded, and any imperfection in the judges' eyes entailing deductions, the highest number of marks denoting the winners. These marks are apportioned as follows:—Upholstery, &c., 14; luggage, &c., space, 10; accessibility and simplicity, 12. These appearance marks are added to the speed-trial marks and deducted from the three days' tour marks, thereby leaving the best car with the least number of marks.

IN respect to the judging in the appearance, accessibility and mechanical excellence competition, the Daimler came out with high honours—these cars being awarded no less than 32 points out of the possible 36.

At the Kesselberg Hill Climb, on Saturday, the weather was wet and the roads were very greasy, and, therefore a change in the actual distance was deemed advisable in order to guard against the possibility of accidents. The best times were as follows:—

Class 1.—(1) W. Poege's 60-h.p. Mercedes 6m. 37s.; (2) Clarence G. Dinsmore's 70-h.p. Mercedes (Driver Werner), 7m. 29s.; (3) Tischbein, 60-h p. Mercedes, 7m. 39s.

Class 2.—(1) E. Langen, 50-h.p. Hermes, 7m. 53½s.; (2) E. Ladenburg's 40-h.p. Mercedes (himself driving), 7m. 59½s.; (3) H. Weingard's 40-h.p. Mercedes, 8m. 11½s.; (4) Edward Manville's 35-h.p. Daimler,

HERKOMER TROPHY AND BLEICHRODER RACE.—The Kochelsee and the Herzogstand (1,757 metres in height).

HERKOMER TROPHY AND BLEICHRODER RACE.—The breezy coloured pictorial heading to the advertisement poster issued by the organisers of this event.

8m. $11\frac{3}{8}$ s.; (5) F. Rendle's 35-h.p. Daimler, 8m. $15\frac{3}{8}$ s.; (6) F. Veith's 40-h.p. Benz, 8m. 24s.; (7) Mrs. Maud Manville's 35-h.p. Daimler, 8m. $30\frac{1}{8}$ s.

Class 3.—(1) M. Martini's 20-h.p. Martini, 8m. $52\frac{3}{8}$ s.; (2) 24-h.p. Adler, 8m. 58s.; (3) 24-h.p. Adler, 9m. 3s.

Class 4.—(1) Branda's 15-h.p. Opel Darracq, 9m. 46s.; (2) 12-h.p. Metallurgique, 11m. 15s.; (3) 12-h.p. Beckmann, 12m. $16\frac{1}{2}$ s. Herdman Ash with his 28-36-h.p. Daimler tied with F. Kosel's 28-40-h.p. Benz with 9m. 7s. Philip Dawson had ignition troubles with his Daimler, although when travelling his speed was grand. Mrs. Manville, as the only lady driver, has received throughout an enviable ovation.

At the 6 kilom. speed tests in the flat in the Förstentrieder Park on Sunday, the best time of the day was made by Mrs. Manville, viz., 4m. $9\frac{1}{8}$ s.; the British Daimler cars securing 1st, 2nd, 4th, and 5th places in the following order. Edward Manville, Mrs. Manville, Frank Rendle, and Philip Dawson respectively. The chief times accomplished were:—

Cat. 1.—W. Poege (60-h.p. Mercedes), 4m. $12\frac{3}{8}$ s.

Cat. 2.—Mrs. Manville (35-h.p. Daimler), 4m. $9\frac{1}{8}$ s.

Cat. 3.—M. Martini (20-h.p. Martini), 4m. $29\frac{1}{8}$ s.

Cat. 4.—C. Bub (12-h.p. Metallurgique), 5m. $20\frac{1}{8}$ s.

In the Motor Cycle Class for the speed events, Frau Gertrude Eisemann, on a $3\frac{1}{2}$ -h.p. machine, was winner in Class I., and Retienne in Class II. (over $3\frac{1}{2}$ -h.p.).

For the tourist run, on the first day, 90 per cent. of the 105 entered cars started at minute intervals, commencing at 4.30 a.m., and 82 of these had arrived at Baden-Baden by 8.10 p.m., Mr. Dinsmore's Mercedes being the first to reach that city. The weather was fine, but the roads were unprecedentedly dusty, causing an accident at the turn before Ulm, whereby a German professor, who was the official observer on Geheimrath Hoffa's car, which turned over, broke an arm.

In the British team Mr. Manville and Mr. Philip Dawson made non-stop runs, but Mrs. Manville's car, which made the fastest time in Sunday's speed trial, had the ill-luck to sustain two punctures, consecutively, near Ulm. A similar trouble prevented Herr Adalbert Schneemen on his 35-h.p. Scheibler car and Mr. Herdman Ash securing non-stop runs for the day.

For the run from Baden-Baden to Nürnberg on Tuesday 77 machines started, of which 74 had arrived in good time at their destination. This journey proved to be a very arduous test, the road traversing mainly a very hilly district, the highest point touched being Dobel, brakes on the descent to Calmbach having a pretty severe trial for efficiency. An unfortunate accident occurred through the excessive dust. One of the

Allgemeine Automobil Zeitung (Berlin München).

HERKOMER TROPHY AND BLEICHRODER RACE.—The tablet seen en route, erected in commemoration of the construction of the Kesselberg Strasse. The size of this monument can be gauged by comparison with the men standing alongside.

competitors in rounding a corner near Herrenalb, about 5 miles from Baden, ran down two children, killing both. Drastic measures were at once announced by the officials forbidding any car attempting to pass any other car travelling at 30 kiloms. per hour. The British team again displayed fine running, non-stop runs being achieved on the Daimlers by Messrs. Philip Dawson, Frank Rendle, and Edward Manville. Mrs. Maud Manville and Mr. Herdman Ash, however, had tyre troubles to contend with.

The final stage from Nürnberg back to Munich was accomplished very successfully on Wednesday, the English owners maintaining their good average up to the finish.

Official figures, which have to be compiled from the observers' notes, are to be issued at the earliest possible moment, but are not available in time for this week's issue of the JOURNAL.

THE Bleichröder Race for cash prizes, 1st £400 and 2nd £100, is for racing cars up to 1,000 kilogs. only, there being two events, viz., over 7 kiloms. on Kesselberg Hill and over 6 kiloms. on the flat, standing start, in the Fürstenreider Park. Under the rules the best average times of the two decides the winner. Cars are divided into heats, viz., 1, cars up to 1,000 kilogs; 2, up to 650 kilogs.; and 3, up to 400 kilogs. Eleven entries were received, and the results were as follows:—

	Time on		Total.
	Hill, 7 kiloms.	Flat, 6 kiloms.	
	m. s.	m. s.	m. s.
1 Hieronymus, 90-h.p. Mercedes (1904) ...	5 34½	3 15½	8 50
2 Werner, 120-h.p. Mercedes (1905) ...	5 56½	3 11½	9 8
3 Wagner, 85-h.p. Opel Darracq ...	5 55½	3 13½	9 8½
4 Braun, 120-h.p. Mercedes (1905) ...	6 1½	3 15½	9 17
5 Hanriot, 120-h.p. Bayard (1905) ...	6 13½	3 17½	9 31½
5 Bugatti, 60-h.p. Mathis-Bugatti ...	6 42½	4 13½	10 55½

HERKOMER TROPHY AND BLEICHRODER RACE.—Urfeld on the Walchensee, 200 metres above the Kochelsee, which latter place is 65 kiloms. from Munich. The Kochelsee was the scene for the opening of the proceedings on Saturday, when the cars competed in the hill-climb on the Kesselberg towards Urfeld, and an excellent view of it is given in our Frontispiece.

THE very sad case of the little girl who was recently killed by a motor car near Nottingham will call forth sympathy for the parents from everyone who reads about it, and particularly from all automobilists. It was an accident pure and simple. The driver, whose own local police gave him a testimonial as a specially careful man, was exculpated from all blame, and he at once stopped and conveyed the injured little girl to the nearest doctor. At the same time, the coroner's inquest elicited evidence from the Deputy Chief Constable to the effect that it was the first fatal accident that had occurred in Nottinghamshire and that the police had next to no trouble with motorists.

MME. Senger Battaue the well-known Munich concert-singer, was recently motoring through a forest when an ungallant and presumably unmusical wild-boar emerged from the piney-fastnesses surrounding the road, and charged full tilt at the *diva* and her car. Nemesis in the shape of sudden death overwhelmed the boar, but the car overwhelmed a telegraph pole, and threw out the lady. She is now being sued by the *Staatsförstundwälderverwaltung* for the cost of the boar, and by the *Staatspostundtelegraphenverwaltung* for cost of the telegraph pole. She is counterclaiming for damages for the-to-her-car-and-person-boar-occasioned-damages, and everyone wants to know how the litigation will end!

LONDON to Paris by motor car looks like being a regular excursion, judging by some tests which have recently been made. Starting with a 14-h.p. Mors car, fitted with Continental tyres, from Piccadilly, the journey was accomplished in fourteen hours. Leaving London at 7.30 a.m., Folkestone was reached at 10.30 a.m. The boat arrived at Boulogne with the car on board at 3.30 p.m., and the car was in Paris, 158 miles from Boulogne, at 9.30 p.m. Upon the return journey one hour upon this time was saved. Leaving Paris at 6 a.m., London was reached by 7 p.m. It will be seen that a very large amount of the time is lost in crossing the Channel, and no doubt, with a regular handling of cars the journey could be accomplished in considerably less time. We, however, hardly see the object, both from the view of expense and waste of time, in shipping the car backwards and forwards over the Channel. We would suggest that if a novel service of this sort is likely to appeal to a number of travellers, that two cars of similar make might with advantage be employed, one on either side of the Channel, to run from London to Folkestone this side, and from Boulogne to Paris on the French side. By this means regular bookings could take place, and travellers carried both ways without necessitating the outward and return journey being made on consecutive days by the same parties.

THE DELAUNAY-BELLEVILLE PETROL CARS.—PART III.

THE clutch is of the leather-faced cone type, and is, as usual, combined with the flywheel. The inner member, E^1 , is mounted on an extension of the crank-shaft, D , so that it is always in alignment with its fellow-member.

the rod, G^1 , a spring being provided in order to automatically disengage the pawl as soon as the pedal is released. A very powerful shoe-brake, F^1 , is fitted to the right of the gear-box, and the brake-shoes are hollow, so that cooling water may be circulated through them from a small tank fixed to the side of the frame. The hub-brakes, which are operated by hand, are of the internal expanding type. Both hand and foot-brakes are interconnected with the clutch, but may be easily rendered independent if so desired.

On the 16-h.p. chassis, which, as has been mentioned, is also made in the live-axle type, the propeller-shaft is enclosed in a stationary tube which is bolted to the casing surrounding the differential gear, and in this way the "torque" tending to twist the axle casing is counteracted. Behind the gear-box is a universal joint, enclosed in a neat aluminium case, which revolves with the shaft, and between this case and the gear-box itself is the foot-brake, which, on this model, is of the internal expanding type.

As a protection from mud and dust, the under part of the chassis, of each type, is protected with a close-fitting metal shield which extends from beneath the radiator to behind the gear-box, and thus thoroughly encloses all the moving parts likely to be affected by dust, while at the same time presenting a smooth surface to the air which, in the prevention of eddies, should do something towards minimising the amount of dust raised by the car. Numerous doors are, of course, provided in this shield, so that the in-

spection or parts from the outside is not interfered with to any extent.

The length of the wheel base and track on the various models are as follows:—16-h.p. wheel base 2'86 m.

The arrangement of the spring, E^5 , is clearly indicated in Fig. 10, and it will be noticed that when the clutch is engaged, the pressure of the spring imposes no end thrust on any shaft. When the clutch is disengaged, the thrust of the spring, E^5 , tends to draw the crank-shaft backwards, but this is, of course, resisted by the crank-shaft bearings. In the same illustration (Fig. 10) will be seen the adjustment-nut, E^6 , which—being outside—is consequently very accessible. The drive is transmitted through the sleeve, E^2 , to the enclosed universal-joint, E^3 , and so to the shaft, E^4 , which leads to the gear-box.

The gear-box itself is supported at three points only, in order to render it independent of any twisting which might take place in the frame. The lay-shaft lies immediately below the "through" shaft—on which the single sliding member is mounted—and both shafts run on ball bearings. Four forward speeds and a reverse are provided, and on the top speed the engine drives direct to the differential countershaft. Inspection covers are provided in the gear-box, and in the casing over the differential countershaft.

On the countershaft, to the left of the gear-box, is a ratchet wheel, with which a pawl can be brought into engagement—by means of the pedal, G —in order to act as a sprag. The sprag-pedal, G , is visible in Fig. 11; it is situated between the brake pedal (on the right) and the clutch-pedal (on the left); it controls the pawl through

Fig. 9.—Elevation of the Delaunay-Belleville Carburetor, showing the mixing-chamber in section.

Fig. 10.—Sectional elevation of the Delaunay-Belleville Clutch, showing the arrangement of the spring and of the adjustment-nut, E⁶.

track 1'45 m. (4 ft. 9 in.). Both the 24-h.p. and 40-h.p. models are shod with 880 × 120 mm. tyres back and

front, while the 16-h.p. car has the same sized tyre on the rear wheels, but is fitted with 875 × 120 mm. tyres in front.

In all respects, it will be noticed, from the numerous photographs which we have given, that the closest attention has been given to detail as well as to the general construction of the whole, and there can be no doubt that Messrs. Delaunay-Belleville have succeeded in designing a machine which cannot fail to appeal to a very large section of the motoring public, both on the Continent and on this side of the Channel.

RAILWAYS AND MOTOR VEHICLES.

THE Great Eastern Railway are considerably extending their road motor car services in connection with their rail system. In addition to the routes previously covered by the Company, they have decided to run the following additional services:—Between Lowestoft, Oulton Broad, and Carlton Colville; Norwich, Loddon, and Beccles; Colchester and Mersea, Chelmsford and Writtle; Chelmsford and Danbury; Chelmsford and Great Waltham; Clacton and St. Osyth; Ipswich and Shotley. In some of the special bills issued by the Company in regard to these motor omnibuses, the Company, possibly appreciating the condition in which many of the local authorities maintain, or rather fail to maintain, their roads, protect themselves in regard to the running of the services by the words "conditions of road permitting."

JUST as the railway companies, far from eliminating the horse, have become the chief horse users of the kingdom, so they are more and more developing motor traction to feed their railways. In addition to the success and extension of the Great Eastern Railway Company's motor 'bus service, the Great North of Scotland Railway is now promoting a Bill in order to enable them to run a number of motor 'bus services to feed their railway in the thinly populated districts adjacent to it. These districts stand badly in need of improved means of communication, but the population is so sparse that light railways, even with Government support, would be out of the question. The company hope to successfully cope with the situation by means of motor 'buses and motor delivery vans.

It is curious to note in respect to the extension of motor services by railway companies and others sufficiently enterprising to take up this form of locomotion, that in many districts ridiculous opposition is offered through residents and members of the local council,

simply upon the principle that local tradesmen should have all the benefit of any innovations. The trouble, however, in questions of this sort is generally that the local tradesman has little or no enterprise or initiative to take the matter in hand himself, and, consequently, acts the dog-in-the-manger, in which he is often backed up unreasonably by the somewhat narrow-minded views of the local council. A case in point is the application to the Clacton Urban District Council recently by the Great Eastern Railway for a licence to run motor omnibuses to St. Osyth, a service which was started this week. Following the presentation of a memorial signed by several local jobmasters, it looked for a short time as if the application might be refused simply because the local jobmasters, according to the memorial, were the possessors of a certain number of horse-drawn brakes and omnibuses. This application of the Great Eastern Company, however, together with another from a local resident, fortunately complied with the principles boldly enunciated as governing the Urban Council, viz., that licences and privileges of a beneficial trading character should only issue to actual ratepayers in the district. In other words apparently, therefore, the Council of this otherwise up-to-date town are prepared to set their face against all improvements in any respect whatever, which emanate from any outside source, unless one or more of the local inhabitants are personally likely to reap the major part of the profit of the transaction. Fortunately, the Council have a strong vice chairman in Mr. Thos. Cox, whose tersely expressed views that the licence should be granted, carried sufficient weight and support from the rest of the Council to overrule the non-progressive members, one only at the finish registering his vote against "Progress." Possibly the same principle is accountable for the "hanging up" of the Clacton Motor Race Course, at one time spoken of so hopefully, and which now and again shows signs of being brought to life once more. But somehow we do not think that *that* is the only reason in this particular case.

SPRING WHEELS FOR MOTOR CARS.

(Continued from p. 105.)

THE HALLÉ SPRING WHEEL.—I.

DESIGNED on somewhat original lines, the Hallé spring wheel—brought out by Mr. Clifford Hallé, who is already well known in connection with the automatic rifle bearing his name—differs considerably from the other spring wheels which have so far come before our notice. The original idea of the invention—for which Messrs. C. S. Rolls and Co. have secured the sole agency—was to use only one spring, and this object has been attained by an ingenious arrangement of links, placed between the hub-member and the wheel proper, by which the radial forces, tending to make the hub and the wheel eccentric to one another, are transmitted to a helical spring surrounding the hub. It was found, however, that this particular arrangement was such that the spring was too easily compressed by the initial load, and for this reason it has been deemed advisable to employ supplementary springs arranged in a more orthodox fashion, and in such a way that their principal use should be in damping out the lighter shocks to which a wheel is constantly subjected. No alteration in the general principle of the wheel was necessary to accommodate these supplementary springs, except that the central spring surrounding the hub was divided to allow a collar to be placed on the centre of the hub, from which spokes could pass outwards for supporting the supplementary springs. Since its original state, however, the Hallé wheel has undergone several modifications as regards the arrangements of these supplementary springs, and now, in its latest form, not only do they give the requisite stiffness at light loads, but they are so arranged that, for normal running over a theoretically smooth road, the hub and the rim are maintained concentric, an important feature, which considerably reduces certain frictional and other losses, as will be explained presently.

Fig. 1 shows an early form of the Hallé wheel, which will, however, be better understood by reference to Fig. 2, in which is shown a front elevation and two sectional side elevations of this wheel; of the latter, that on the left represents the wheel in its normal unloaded state, while that on the right shows the effect produced by the load in making the hub eccentric to the wheel proper.

Before actually describing the construction of the wheel, it may be as well to consider the principle of its action as diagrammatically illustrated in Fig. 3. In

Fig. 3, X, Y, Z represent three bars which are linked together "parallel-ruler" fashion by the hinged links, C; the centre bar, Y, represents the wheel proper, and the two outer bars, X and Z, represent sliding flanges attached to the hub. It will be obvious that any force applied axially to the centre bar, Y, tending to raise or lower it relatively to the outer bars, X and Z, will tend to move these two bars either towards one another or away from each other, according to the relative initial positions of the three bars. Conversely, too, any force tending to push the two outer bars farther apart will tend to lift or lower—as the case may be—the centre bar, Y. Both these actions are employed in the Hallé wheel; the road should tend to make the hub eccentric to the rim—which is equivalent to lifting the centre bar, Y—and a strong helical compression-spring, interposed between the two outer bars, X and Z, opposes this relative motion

of the centre bar, Y, and restores it to its original position after it has been moved. When quite unloaded, the wheel is in the state represented by the left hand diagram in Fig. 3, where the links, C, are at right angles to all three bars, X, Y, Z, being retained in that position by the action of the spring (not shown in Fig. 3), which tends to force the two outer bars, X and Z, as far apart as the links, C, will allow. Any relative motion of the centre bar, Y, from this position will shorten the distance, "a," and thus compress the spring; such a condition is shown on the right of Fig. 3, and this represents, diagrammatically, the relative position which the principal members of this spring wheel assume under working conditions. It must be understood that with this, as with other

Fig. 1.—The Hallé Spring Wheel. View of one of the original Hallé Spring Wheels fitted to a car for experimental purposes.

spring wheels, the hub is normally eccentric to the wheel proper—except in such wheels as those of Mr. Hallé's very latest type—and that the effect of shocks due to uneven roads is merely to emphasise this eccentricity. It will be noticed, too, that the construction is such that the wheel is virtually a single unit, so far as sideways forces are concerned, and that although the centre member can (with the arrangement of the links, C, adopted in practice) be made to lie obliquely between the two outer members, yet the spring is at all times in such a position as to directly resist any such displacement. An interesting point in the principle of the wheel is the relative effectiveness of a given load in compressing the spring under various conditions. With the links extended to their full length, as in the left-hand diagram in Fig. 3, the load exerts a very powerful

force over the spring, and a comparatively slight load will be sufficient to compress the spring to a certain extent. As the eccentricity between the hub and the wheel increases, the resisting power of the spring is rendered

were twofold. In the first place, the supplementary springs were being periodically deflected and released—a source of lost power which may be likened to a car always going uphill—and in the second place,

Fig. 2.—The Hallé Spring Wheel.—Elevation and Transverse Sections of the Wheel. The section on the extreme right shows the wheel when the hub is eccentric to the rim, and illustrates the action of the links, C, in compressing the spring, D, by means of the sliding flanged sleeves, B².

more effective owing to the obliquity of the links, C, and finally—for exceedingly eccentric positions—the effect of the springs is relatively greater than the effect of the load. If the spring is stiffened up, or given greater initial compression, in order to be sufficiently effective at light loads, it will be too strong at heavy loads, and will not sufficiently damp out the serious shocks caused by the more uneven road surfaces. The alternative is to use supplementary springs arranged to receive the initial loads with greater directness, and this alternative has been followed in the Hallé spring wheel. At first, four semi-elliptic springs were employed in the Hallé wheel, but as these were found unsatisfactory, they were discarded in favour of four volute springs arranged radially to the hub.

In the latest form of wheel the auxiliary springs are still volute in form, but instead of only four they number sixteen. In the two former types of wheel, the auxiliary springs formed a complete inter-acting "system" in which they were in equilibrium among themselves, that is to say they were sensible to any external force. When the wheel was in place, therefore, the axle at once became eccentric to the rim, by virtue of the weight of the car alone, being suspended in that position by one, or at the most two, of these supplementary springs, which were of course assisted in this by the action of the main helical spring surrounding the hub. The objections to this normal eccentricity

certain links—to be described later—used in the construction of the wheel, were, by their enforced obliquity, a source of constant friction. The very latest type of Hallé wheel has been designed to overcome both these drawbacks and, although the supplementary springs are still of the volute pattern, they are each self-contained in such a way that they can be made to carry the dead load of the car without deflection. The springs are now arranged no longer form a "system," and, in fact, the wheel is to all intents

Fig. 3.—The Hallé Spring Wheel.—Diagram explanatory of the action of the wheel.

and purposes "solid" until the load exceeds a certain predetermined minimum. Directly this takes place—as it very easily does under quite ordinary road shocks—both main and supplementary springs begin to compress simultaneously, the only difference in their effect being that whereas the main spring may be relatively less effective

than the auxiliary springs at first, its power of resistance—owing to its peculiar position—very rapidly increases with the "eccentricity" and the wheel is less effected by the heavier shocks than it would be were all the springs radial to the hub.

(To be concluded.)

MOTOR CYCLING.

AUTOCYCLE CLUB'S RELIABILITY TRIAL.—Lining up for the start outside the Club Garage.

AUTO-CYCLE CLUB'S RELIABILITY TRIAL.

THE second annual trial for motor cycles and tri-cars organised by the Auto-Cycle Club, started on Monday last and concludes to-day (Saturday). Of the 33 entries—of which full particulars were published by us last week—only one (No. 33, 4-h.p. Barnes) failed to turn up at the start, which took place from the Club Garage in Down Street at 9 o'clock Monday morning. Last year, it will be remembered, a start was made from the neighbourhood of Regent's Park, but although the Garage is scarcely an ideal situation for a meeting of this description, yet it saved considerable time and confusion to use it as such this year.

There was very little of novelty noticeable in any of the machines assembled for the trials. One or two of the bicycles had more than usually efficient silencers, three had twin-cylinder engines, and a few were fitted with some form of spring suspension for the front wheel. Of these latter, a 3½-h.p. Vindec (No. 3) had the Truffault suspension, which consists of a helical spring inserted in the front tube, and a friction damping device arranged outside, the damper being merely a pair of semi-cylindrical brake shoes pressing against the side of a round rod. The two Werner bicycles (Nos. 6 and 7) also had a spring suspension, but in this case, the front wheel is mounted on a separate bracket fulcrumed about the lower end of the front fork. Helical tension springs, attached to the front fork and to lever arms projecting rearwardly from this bracket are used to give the necessary spring support. In the 3-h.p. Triumph (No. 19), the spring is introduced so as to act in quite a different way. The front forks of this machine are mounted on a horizontal trunnion, and a lever-arm projects upward from the front fork, and is connected through springs to the front tube. The arrangement is such that the wheel can recede bodily backwards when meeting a large obstacle, but at the same time the "rake" of the front forks is such that the ordinary up and down vibration is also damped to a large extent by the same device. On one other machine, a 3½-h.p. Rex (No. 9), Hallé spring wheels were used, and both back and front were shod with solid tyres.

Eight tri-cars were entered, among them being two French machines—the Mototri-Contal—primarily designed as carriers. The engine is water-cooled and a single reduction-gear is introduced

between the crank-shaft and the chain-drive to the rear wheel. This reduction-gear is carried by the crank-chamber, and although arranged outside, it is thoroughly enclosed. Inside the rear hub is a two-speed epicyclic gear. A foot-pedal is conveniently arranged to "free" the gear and, when fully depressed, to apply a brake. One of the features of the machine is the arrangement of the tanks and cupboard for accumulators immediately behind the front seat, thus minimising as far as possible the length of all pipes and wires. Luggage and tools are carried under the front seat, which is hinged to give access to the box beneath it.

The question of luggage is a serious matter on tri-cars, and, as most of them have no conveniences, it is necessary to strap a bag—and that an inconveniently small one—on the footboard or behind the saddle. One of the Riley tri-cars (No. 29) was fitted with a small box for luggage and tools on one side of the driver's seat and a similar box on the other side for the accumulators and coil, but

AUTOCYCLE CLUB'S RELIABILITY TRIAL.—The 8-h.p. Leader, fitted with a twin-cylinder engine and two-speed gear.

The 4-h.p. Mototri Contal, a French made machine, driven by Gaston Rivierre.

AUTOCYCLE CLUB'S RELIABILITY TRIAL.—TWO OF THE TRI-CARS.

the box naturally provided somewhat limited accommodation. The 6-h.p. Leader tri-car (No. 28) is, except in one or two points, of the usual type. One of the features is that the back wheel can be removed very easily and two separate silencers are employed, one for each cylinder. A particularly neat accumulator box, in which the cells are prevented from shaking about, and the box is kept water-tight, is fitted to this machine.

On the 6-h.p. Quadrant, there are two separate engines arranged side by side, both driving on to a common countershaft by chains. Separate chains pass from this countershaft to different-sized chain sprockets on either side of the rear-wheel, and either chain may be brought into operation at will, by means of clutches, to give the high or low gear. The engines are not intended to run independently, although as originally designed the two engines could be uncoupled; this feature, however, has now been eliminated because it was not found advisable. Jockey pulleys are provided for tightening up the chains between the engines and the countershaft.

In the majority of cases, no attempt is made to suspend the rear-wheel independently of the frame, and the Lagonda tri-car is, therefore, particularly interesting for the departure which it makes in this direction—the rear-wheel being supported from the frame by a pair of long leaf springs.

Taking the tri-cars as a whole, there appears to be no improvement with regard to protecting the engine from mud and dust, although some of the machines are now much better made. A marked increase in the engine power is noticeable in certain cases,

Tyre Repairs.—Success or failure depends, when repairing a tyre, very greatly on a methodical manner of doing the work, and many amateurs fail in their arduous but often essential process of renewing an inner tube or cover, merely because they have never given even a small amount of study to the question. All tyre firms now issue little instruction booklets, and that issued by the Michelin Company, the latest edition of which is just to hand, embodies in the smallest possible space an amount of information on the subject of tyre repair, which, once mastered, would make the veriest novice more at home with his work, and do much to minimise the annoying effects which too often arise through the work being carried out imperfectly.

SPEAKING at the luncheon of the Welbeck Tenants' Agricultural Society, the Duke of Portland recently said that while he objected to the automobile "road-hog" and reckless driver as much as any one, he would impress on horse drivers and dog owners that they should do what they could to prevent wilful obstruction of motor cars; though some motors had objectionable features they had as much right to the road as other people. His Grace also welcomed the appointment of the Royal Commission on the motor car question.

The 4½-h.p. Riley, showing the position of the accumulator and tool boxes on either side of the driver's seat.

however, the Riley (No. 32), for instance, having a twin-cylinder engine developing about 12-h.p. This machine was fitted with 3½-in. Dunlop tyres, that on the rear wheel being covered with a non-skid band, but even with these comparatively large tyres the strain on the single rear wheel, which generally runs in the worst part of the road, is enormous, and the difficulty of obtaining enough adhesion for the power transmitted would also appear to be a drawback. Just where the tri-car with an engine of this high power possesses any advantage over a light car—assuming that a tri-car of any description is a desirable machine—it is difficult to say. The light car with an engine of 12 h.p. certainly offers more comfortable accommodation, the repairs bill would probably be less and the life longer, while the speed—which is presumably the real attraction in the lighter machine—would be as fast as is desirable with a car of such build.

THE Auto-Cycle Club's revised open competition rules have been finally passed by the Auto-Cycle Club, and are now in force.

Under these rules, no open meeting, competition or trial shall be held without a permit from the Auto-Cycle Club. The fee for the permit will be one guinea for each day of a meeting. To clubs affiliated to the Auto-Cycle Club the fee payable is one half-guinea for each such day, and clubs affiliated to the National Cyclists' Union holding a meeting upon a track are exempt from the payment of a fee.

By an oversight in drawing up their advertisement announcements in connection with the recent Blackpool Race Meeting, the Daimler Motor Company stated that their 35-h.p. car had beaten amongst others in their class the 40-h.p. De Dietrich. As a matter of fact this is not correct, inasmuch as although the De Dietrich car was amongst the list of entries, it did not actually compete, and, therefore, should not have been included in the Daimler Company's list of triumphs. In justice to Messrs. Jarrott and Letts, Limited, who are the agents for the De Dietrich cars in this country, the Daimler Company are anxious to rectify this unintentional mistake made in their advertisement department.

A VERY valuable testimony to the De Dion cars has been received by the London representatives of De Dion Bouton, Limited, from Mr. G. B. Hamilton, of 31, Deodar Road, Putney, S.W., who writes as follows:—

"Perhaps it will interest you to know what I—a layman—think of your car for everyday work. Well, we have used it regularly over some of the worst roads of East London—and they are bad—for eight months, covering something like 7,000 miles, constantly stopping and starting, and during all that time it has never given us the least trouble. I do not think the car has cost 20s. for repairs and does everything within reason admirably. Of course, we have a good chauffeur, and we use the car in a rational manner."

THE TOURIST TROPHY—(continued).

THE article on this subject, in which we not only attempted to familiarise our readers with the fundamental principles of this novel type of competition for touring cars, but also put forward various suggestions for future years, appeared in our issues of July 15th, 22nd and 29th, and in our editorial front paragraphs we invited all those who took sufficient interest in the automobile movement to write expressing their views. A number of useful communications from leading men have already appeared in our columns during the last three weeks, and we now publish a further batch of the numerous and very valuable contributions that have come to hand. We would again express our hearty thanks to all those who are coming forward and are helping to ventilate this important matter in the interests of the whole automobile industry.

To facilitate reference to the various specific points raised in our article, and referred to by our correspondents, we reproduce the summary of the chief suggestions put forward by us, as also the list of the weights, measures and dimensions that are specified by the rules for this year's race.

Suggested Modifications of Rules for Future Years.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

Specified Weights, Measures, and Dimensions in the Existing Tourist Trophy Rules for this Year.

- (A) *Fuel Consumption*—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

VIEWES AND OPINIONS OF OUR READERS.—IV.

Mr. Henry Sturmev:—

I accord generally with the views expressed and with your remarks concerning the Tourist Trophy. I consider the race should, as far as possible, be for just the standard tourist cars being regularly put out by the manufacturers, and that manufacturers should not be called upon to build special designs—in many ways differing from their standards—for the event. If they have to get out special cars they are almost certain to produce freaks, or at any rate very different cars to those with which they are supplying the public. The best way to check this is not to issue the final conditions and open the entries until say ten or twelve weeks before the race. There would not be time then to design and construct "freak" machines. Taking up the points you raise, I am inclined to think a fairer comparative test would be obtained by a limitation of cylinder capacity and engine speed, or, as you put it, "the total cubic displacement of the pistons per minute," and these conditions are not difficult to check. Length of stroke and piston diameter can in most engines be measured without taking the engine down, and if the cars were timed at several unknown spots along the route when they would be running "all out" on their top gear, and liable to disqualification if, on that showing, the calculated speed ratio of the engine exceeded the limit, the check would be sufficient for all practical purposes. The present limitations as to weight of chassis and weight of body with load appear to be practical, but to make a body in four pieces as you suggest is quite off the rails, as to obtain reasonably strong body construction without undue weight the support from either side is necessary. As to wheel-base, 7 ft. 6 in. is a good average length. We, too, had a sudden rush on the long wheel-base this year, but manufacturers are finding that very long cars, are, in many cases, inconvenient to handle, and so not acceptable to their customers, whilst the difference in strength between, say, a 7 ft. 6 in. and an 8 ft. 6 in. frame is very marked. If number of gears are to be restricted, I think the number should be three, as the tendency to-day in commercial work is all towards a reduction in the number of gears. The Duryea cars, in which I am interested, use two only, and quite the majority of light cars, such as this contest deals with, are fitted with three only. I quite agree that single cylinder engines should be barred, as for cars of the type used they are now never employed, but of two-cylinder engines there are more in use probably than any other in "light touring cars." I cannot agree with the suggestion that different drivers should be employed each day if the race is extended, as that would not be fair to the smaller firms who do not keep large staffs of drivers.

Henry Sturmev.

Dr. C. W. McMurtry:—

Re the "Tourist Trophy," permit me, as one who has spent several summers in touring through the mountainous portions of the Continent, to make several suggestions concerning some points which have apparently been overlooked up to the present, but which, nevertheless, are of decided importance in a car from the real motor tourist's point of view.

1. *Luggage Carrying Capacity*.—You cannot tour with comfort without a sufficient amount of luggage, sufficient to enable one and one's passengers to be appropriately dressed. The luggage should be carried in such a way as to be protected from dust, mud, and rain, not encroach upon the space for the passengers, and be fastened to the car in such a manner as not to affect the balance of the vehicle even at high speeds and when turning corners.

2. *Good balance stability and absence of swing in turning corners* and at high speeds are, next to mechanical reliability, perhaps the two most important points a real touring car can have. While they receive the most careful consideration from designers of fast steamships, locomotives, railway carriages, and even the slower vehicles, mail coaches, &c., automobile engineers and body builders apparently attach little importance to the balance and stability at high speeds of their cars. One has but to look at the illustrations of many types to notice this flippant disregard for the laws of equilibrium and gravity. Hence the bursting of a tyre is sufficient to cause many a car to—like any other top-heavy object—simply topple over. The heavy and unnecessary strains thrown on the transmission, springs, rear wheels, and tyres as the result of a badly designed and ill-balanced body are also to be considered.

3. *Ability to turn the bends of typical mountain roads without using the reverse speed*.—The most beautiful mountain roads in Europe, such as those of the Stelvio Pass, the Col du Galibier, Col du Petit St. Bernard, &c., all have sharp turnings, at which there is usually a wall of solid rock on one side and the edge of a precipice on the other. When one, on account of insufficient lock to the steering wheels, has been obliged to manœuvre his car backwards and forwards on a slippery road, with the outside wheels within a few inches of a sheer drop of several hundred feet into a mountain valley, in order to turn a corner, his experience will lead him to seek some car with a good—though not exaggerated—steering radius. In traversing the narrow, winding streets of Italian and Spanish villages, such extra steering radius is absolutely indispensable.

4. *Absolutely efficient cooling apparatus for the motor*.—The writer is convinced that a motor of more than 24 to 30 h.p. is unnecessary even for the longest Continental tours and steepest mountain roads. Such overpowered motors are a disadvantage on account of their excessive weight, their heavy consumption of oil, petrol, and the strain they throw on the chassis, and particularly on account of the practical impossibility of their being driven at low speeds without great vibration and overheating.

What is needed by the practical tourist is a 24-h.p. car with such large radiator, water pump, pipes, and cylinder jackets as to absolutely preclude the possibility of loss of power through overheating, even on such roads as the Stelvio and Galibier passes, and after a whole day's running through crowded city streets.

I therefore suggest that the capacity of the water cooling system of each car be accurately ascertained, and the consumption of water be controlled throughout the trials.

5. Absolute and complete control of the car—except for changing speed—without removing the hands or even the fingers from the steering-wheel.

"Never abandon or forget your steering-wheel" is a well-known maxim, and to it I would add the firmness of your grip with both hands on the steering-wheel must increase in direct proportion to the car's speed. This is obvious. Therefore a car capable of high speeds, but for the control of which it is necessary to remove one hand from the steering-wheel, even for a moment, is highly dangerous, and should be publicly branded as such.

The above suggestions are simple, and demand no freak mechanical changes in the classic models of to-day, merely more thoroughness and care on the part of our only too frequently supercilious and, as regards *real touring requirements*, often ignorant designers of touring automobiles.

Charles Wood McMurtry, M.D.

Mr. H. Massac Buist:—

The Tourist Trophy is likely to differ from all former motor car races in that one of its chief aims will be to win the attention of the lay public in such a manner as to produce a favourable frame of mind in persons at present averse from the motoring movement. It should be the task of the organisers to interest two distinct sections of that public, namely, those who will be present to witness the competition, and the far larger body which can only be reached through the medium of the printing press and the camera. I hold that sufficient attempts have been made in most European countries to have demonstrated that the erection of stands for the accommodation of spectators at motor car races is distinctly an unsatisfactory method of enabling visitors to follow the progress of such events. Nature has furnished Manxland with grand stands in plenty, and, having the physical features of the island in mind, I would suggest that enterprising speculators might band themselves together in some organised scheme for enabling those onlookers who have not motor cars at their disposal to witness the race from more points of the course than one. This might be done (1) by setting up temporary toll bridges at certain suitable intervals around the course, where, for a nominal charge of a penny, persons would be allowed to get from the outer to the inner side of the circuit, or the other way about; and (2) by running a service of char-a-bancs inside the course from one point or place of interest to another, as, for instance, along the main road westward from Quarter Bridge, and so forth. Many onlookers would gladly spend between five and ten shillings on the day of the competition in getting about the course who would grudge half-a-crown for a seat that would prove wearisome to them after the first hour. For those who have their own vehicles there might be shilling subways to enable them to get inside the circuit at points beyond which it would be inconvenient or impossible to continue a tour round the course on the outer side. Such cuttings, however, might prove too costly for the occasion, unless the Manx authorities were to be given some sort of a guarantee that their island is to be made the scene of all long-distance motor car speed competitions in the United Kingdom.

The spectators will also want official information as to the incidents of the day. I do not mean time boards, which it would be practically impossible to keep posted up to date in a race in which upwards of 50 cars will be competing. They will want to know who has been delayed, or who has abandoned, and where and why and who are the leaders from time to time. With the issue of a proper 2d. official programme—which incidentally should prove a source of revenue to the club—it should be possible to enable visitors to grasp the development of affairs if at, say, half-a-dozen of the chief points of the course the facts enumerated were announced by megaphone at certain pre-arranged and announced periods of the day, as, for instance, every half hour. The information could be jotted down on the programmes, and the news would not be long in circulating. The average onlooker does not want complete statistics, but merely the leading facts concerning what has just been taking place. There is also a good idea at the back of Mr. Claude

Johnson's suggestion about the cars carrying coloured numbers, but I fear the scheme as at present put forward would prove a means of delaying the competitors. At least it would entail certain pauses in control—a system which is likely to prove a great source of difficulty for the officials as regards preventing the cars getting into a hopeless muddle. The ideal method would be to have no controls whatever, or at most merely replenishing places. It is the control business that fogs the lay spectator and upsets all the calculations he may be making.

In regard to the public that can only follow the event through the medium of the Press, it would be helpful if subsidiary prizes were offered for such points as excellence of driving, tyres, petrol, cooling, brakes, and body work, that prominent attention might be drawn to each of those points, thus reducing the element of luck by which, conceivably, one car that was obviously not the best of the competitors might get all the attention of the public because it happens to win the speed-cum-fuelage race. The notice that would be attracted by the subsidiary prizes would go far towards distributing the amount of advertisement to be had from the competition by the entrants. If such awards could be announced on the evening of the race—by means of some previous expert judging, plus the day's performances—the aim would be achieved to an ideal degree, the public memory being short, and the difficulty of obliterating first impressions great.

Complete net running times per lap should be issued for publication to prove to the public that when these presumably useful sizes of touring cars are being raced by expert drivers it is impossible for them to exceed the legal limit by more than 5 or 6 miles an hour. At present the man in the street is convinced that almost any motor car that is not obviously crippled is capable of speed ranges up to between 60 and 70 miles an hour, and the persistent proving of the true facts is the only way to disabuse his mind.

H. Massac Buist.

Mr. A. A. Remington:—

The Tourist Trophy Race is an attempt to so re-arrange racing rules as to once more let motor car races assist towards the production of the perfect vehicle, and at the same time provide a spectacle for the public, and, if possible, awaken some enthusiasm.

It is always exceedingly difficult to combine the useful with the ornamental, and the results of this attempt will, without doubt, be very instructive, both as regards data for the improvement of the rules as well as of the vehicles.

The object of such a race must necessarily be towards the improvement of the *bona fide* touring machine, the most important requirement of which is, at the present time, putting on one side the necessary refinements as silence, elegance, &c., the ability to maintain a maximum average rate of travel with the least possible maximum speed.

The rules do not appear to provide for this point, and it appears as if high-speed coasting will go a long way towards success.

Undoubtedly the rules encourage "freak" construction in certain directions if manufacturers take the trouble to design anything specially for the event, which is very questionable.

An engine with a variable compression ratio together with a variable suction-pressure, so as to get a high expansion ratio on light loads, would have a considerable advantage. The average output of all the engines will necessarily be considerably below their maximum, and this is just where the ordinary engine is so wasteful, while an engine on the above lines would be more economical than at full load, although undoubtedly a "freak" and not commercially useful.

This is only one point, but many others exist and only require searching for.

Further, why limit the chassis weight? Surely a minimum would be sufficient, and having stipulated such a minimum, and the minimum body requirements, what necessity is there to stipulate a minimum wheel-base.

These restrictions are not only unnecessary but galling, as in many cases, no doubt, manufacturers' standards for first-class cars lie just outside the tolerance given.

Doubtless, one race under the existing rules will show many more improvements than volumes of letters, and it is well to know we are at last moving, however slightly, in the right direction.

A. A. Remington

MOTOR BOATING.

MOTOR YACHT CLUB RACES AT SOUTHAMPTON, AUG. 12.—Mr. H. Perman's "Pallas," fitted with 28-h.p. Daimler engine, winner in the 30-ft. class.

Judges' remarks on seaworthiness. Boats entered for open course only:—

A good sea boat for her size—Nos. 4, 5, 7, 8.

A good sea boat of her type—Nos. 13, 15, 17, 19, 20, 21.

A sturdy open sea launch—No. 14.

A wet boat in a head sea but seaworthy—No. 25.

A seaworthy vessel—Nos. 32, 33, 35, 36, 37.

NOTES.—A. Did not start on 2nd day; B. retired on 1st day; C. non-stop 1st day, retired 2nd day; D. retired on 2nd day; E. not marked in this class under rules.

IN our last issue we were able to give, in full, the list of awards and the judges' report on the trials, but, as we stated at the time, the detailed table of marks by which the judges awarded the medals was not then available. These particulars have now come to hand, however, and we append them in tabular form below. It shows in a most concise form on what points any particular boat "scored" over any other boats, and equally valuable is the footnote to the table in which the judges comment upon their seaworthiness.

With regard to reliability, the brief particulars of the breakdowns were given by us last week. Speed also was recorded in our table, but on the question of economy no information was then available. In Class II. the Thornycroft boat has been awarded full marks, while the little De Dion boats and the Simpson-Strickland steamboat "score" in Class III.; and the Simpson Strickland is again well to the fore in Class IV., only the Parsons boat, which used paraffin, gaining higher marks for economy. Most boats received full marks for condition after trial but a large percentage of full marks for arrangement of tanks, &c., is only noticeable in Class VII. Under the heading of silence, nearly every boat receives full marks, likewise for ease of control, but this evidently refers only to the engine because under "Efficiency of Reversing Arrangements"—which is a most essential element in the control of a boat—full marks are only given to comparatively few.

WITH reference to our table last week of Motor Boat Reliability Trial results, Messrs. Thornycroft write us that the smallest of their boats (No. 5), although originally entered for the sheltered course did actually take the open course on both days. Instead of covering only 55 miles, therefore, the distance was 73½ miles, and the speed in consequence 7·85 miles per hour—a most creditable performance for a boat of this size.

MOTOR YACHT CLUB'S RELIABILITY TRIALS.—The "Iris"—a petrol motor boat, entered by Messrs. Perman and Co., the engine of which was built by Messrs. Legros and Knowles. In general design, the engine in this boat follows the same lines as that employed on the Iris cars, but it has been specially constructed for marine work, and no aluminium whatever has been employed for any part, the base chamber being of cast-iron, and the pump, carburettor, and other small fittings, of gun-metal. The "Iris" marine set has been very carefully designed, great attention having been given to ensuring accessibility and ease of control without at the same time sacrificing anything to neatness and strength. Another great point, too, is that the plant is made as complete as possible in itself, and is built on a substantial bed-plate, thus minimising both trouble to the boat builder and expense to the purchaser. Although only completed just before the event, the boat ran splendidly throughout, the engine giving no trouble whatever.

THE local correspondent who wired the points about the "Entente Cordiale" Cup was evidently under a misapprehension with regard to the performance of the Brooke boat, and our report, last week, was in consequence unwittingly unjust to the victorious Napier II. which completed the course in 1h. 29m. 53 $\frac{3}{4}$ s., and made the fastest speed of the race (23 $\frac{1}{2}$ knots per hour). The complication arose through the Brooke boat break-

ing down and, after effecting a repair, returning, but without completing the course, just a few minutes ahead of Napier II. which had, of course, been over the full distance, while the semblance of a Brooke victory was increased by the elapsed time having been regarded as for the full course, although we learn from Mr. Mawdsley Brooke that he purposely steered his boat over the wrong line to avoid confusion.

CLUB DOINGS.

ABOUT forty members of the Leicestershire A.C. were present at a very successful Garden Party at Oadby Hill, on Saturday last, in response to the invitation of Mr. and Mrs. John Arthur Corah.

West Surrey A.C.—The second annual gymkhana was held on Saturday last in the grounds of Prior's Field, Compton, Guildford, kindly lent for the occasion by Mr. L. Huxley.

The prizes were presented by the Hon. Mrs. St. John Brodrick, who, after a tour of the course (600 yards long) on the secretary's car, was the recipient of a bouquet at the hands of Miss Victoire Fairtlough, daughter of the chairman of the club.

The results were as follows:—

Garage Race.—1st, Mr. Buttemer, 10-h.p. Decauville; 2nd, Mr. Knight, 8-h.p. Argyll.

Tilting at the Ring.—1st, Col. Howard Fairtlough, 12-h.p. Darracq; 2nd, Mr. Ponsford, 8-h.p. Clement.

Bending Race.—1st, Mr. Sichel, 10-h.p. Argyll; 2nd, Mr. Buttemer.

Starting Race.—1st, Mr. Williams, 18-h.p. Martini; 2nd, Mr. R. Crothers, 9-h.p. Darracq.

Passenger Race.—1st, Mr. Williams; 2nd, Mr. L. Pullman, 4 $\frac{1}{2}$ -h.p. De Dion.

Chalk Line Race.—1st, Mr. Williams; 2nd, Mr. Buttemer.

Glass of Water Race.—1st, Mr. E. Fairtlough; 2nd, Mr. Sichel.

Potato Race.—1st, Mr. Pullman; 2nd, Mr. Fairtlough.

The challenge cup presented by Sir A. Conan Doyle fell to Mr. E. Williams, as winner of most events.

A puncture race for members' chaffeurs was won by Mr. Ponsford's driver in excellent time.

A concourse of over 200 visitors assembled to witness the events, one result of which has been a substantial increase in the number of candidates for membership of the club.

The duties of judging were undertaken by Messrs. C. Crawley, J. F. Ochs, and J. Sparkes, while the timekeeping was in the hands of Mr. F. Straight.

COMMERCIAL POINTS.

A SPECIAL type of car is, we hear, being built by the well-known De Dietrich firm, to suit American and Colonial roads. The chassis, unlike those of the present standard models, is designed so as to give a considerable amount of clearance above the ground, and many of its parts—including the axles—differ materially from those hitherto employed.

MICHELIN tyres had a big innings in the Circuit des Ardennes Race, and this, following upon their remarkable success in the Gordon-Bennett Race recently, makes the manufacturers of these world-famed tyres particularly jubilant. The following are the gains which they made on the Ardennes Course:—

Voiturette Class (201 kiloms.).—1st, Wagner (Darracq).

Light Car Class (600 kiloms.).—1st, Montjoie (Darracq).

Heavy Car Class (600 kiloms.).—1st, Hemery (Darracq); 2nd, Tart (Panhard); 3rd, Leblon (Panhard); 4th, Wagner (Darracq); 5th, Heath (Panhard); 7th, Duray (De Dietrich).

AMONGST recent purchasers of Daimler cars are:—The Earl of Sandwich, the Earl of Redesdale, the Earl of Leven and Melville, Lord Windsor, Lord Algernon Percy, the Hon. A. H. Mills, Sir Percy Fitzpatrick, Sir Alfred Hickman, Bart., and Sir Hugh Shaw Stewart, Bart., M.P.

SERIOUS enquirers for a motor car, living within a 10 miles' radius of London, are afforded the opportunity of a free trial run, for the Gladiator Company, of 8 and 9, Long Acre, W.C., will send to the door of such one of their landaulettes. On receipt of a post card date will be arranged.

MRS. MANVILLE'S 35-h.p. Daimler car, on which she made the best time of the day in the speed tests in the Forstenreider Park, we learn was fitted with Collier tyres. The similar cars which gained second and fourth places were also equipped with Colliers.

RACES, RECORDS, AND TRIALS.

GLIDDEN TROPHY TOUR.—At Mount Washington Hotel, in the White Mountains. The tourists ready to start upon their return journey to New York.

Glidden Trophy.—As we briefly announced last week, this cup has been allotted to Percy P. Pierce, who drove a 28-32-h.p. Pierce-Arrow car, carrying four passengers. We say "allotted" advisedly, as, under the rules, at the conclusion of the tour, those owners whose cars have finished the tour and complied with the conditions, decide who, in their opinion, are the three competitors who have accomplished the best all-round touring performance. This information is used by the commission appointed under the rules in deciding the winner—a procedure which is certainly simple and as easy-going as anyone could wish for in a contest, although it is understood other factors were considered by Mr. Glidden and the commission, including selling price, seating capacity, weight, repairs made, and cost of running the cars. Twenty-two competitors were thus entitled to record 66 votes, and of these Pierce received the largest number, viz., 15. Those receiving first-class certificates are: Augustus Post (White), Ezra H. Fitch (White), Carl H. Paige (White), Walter C. White (White), W. N. Epping (White), Albert L. Pope (Pope-Toledo), Harold L. Pope (Pope-Tribune), C. E. Walker (Pope-Hartford), W. C. Temple (Pierce), Ralph S. Coburn (Maxwell), Benjamin Briscoe (Maxwell), George Otis Draper (Packard), John C. Kerrison (Cadillac), E. A. Gilmore (Rambler), S. B. Stevens (Darracq), Robert Lee Morrell (Locomobile), A. W. Church (Decauville), Julius Mehlig (Knox), E. H. Cutler (Knox), R. E. Olds (Reo), R. M. Owen (Reo). Those receiving second-class cer-

tificates are: Mrs. Joan Newton Cuneo (White), C. J. Edwards (Cadillac), C. W. Kelsey (Maxwell), and G. H. Tyrrell (White). On these were erased the words "registered according to conditions at all controls." Next year the cup tour is to be controlled by the A.A.A., and observers assigned to each car.

Skegness Sand Races.—The meeting organised by the Nottinghamshire A.C. for September 2nd will comprise eight racing events in addition to an Appearance Competition prior to the racing. For the Appearance Competition, cars are to line up on the Parade at 11 a.m., a gold and silver medal being offered as first and second prizes, and the programme for the tourist car events and the motor cycles will commence at 12.30 p.m. First and second prizes consisting of gold and silver medals are offered in each event, with the exception of Event H, in which the first prize will be a silver cup and the second a gold medal. The entrance fee for each race is 5s., entries closing on August 24th at 6 p.m. The actual times accomplished in the tourist events will not be published, but an order of merit will be given, similar to the Brighton races. The auto-cycle event is open only to standard touring machines, fully equipped for the road, cut-outs being prohibited. Each cycle must have a tank holding at least 1 gal. of petrol. Lieut.-Col. R. L. Birkin, D.S.O., will act as judge for the races, and Mr. Booth Granger has undertaken the secretarial portion of the meeting, to whom all applications for particulars

Mr. Luff Smith weighing in at Martley with his 12-h.p. Wolseley.

The cars "parked" at the bottom of the hill.

SHELSLEY WALSH HILL CLIMB.

and entries should be addressed at 10, Wheeler Gate, Nottingham. The events for tourist cars are as follow :—

One Mile Handicap Race (Event B).—Open to any type of car, owned by members of the Nottinghamshire, Leicestershire, Lincolnshire, and Derby and District Clubs.

Events open to Members of the A.C.G.B.I. and Affiliated Clubs.

One Mile Scratch Race (Event C).—For cars listed at not more than £200 complete, and to carry driver only.

One Mile Scratch Race (Event D).—For cars listed at not more than £350 complete. Cars costing not more than £250, to carry driver only; cars costing more than £250, to carry driver and one passenger.

One Mile Scratch Race (Event E).—Chassis price of which is not more than £500, and carry driver and one passenger.

One Mile Scratch Race (Event F).—Chassis price of which is not more than £700, and carry driver and one passenger.

One Mile Scratch Race (Event G).—Chassis price of which is over £700, and carry driver and one passenger.

One Mile Scratch Race (Event H).

One Mile Scratch Motor Cycle Race (Event J).—Limited cycles not more than 5-h.p.

Midland A. C. Hill Climb.—By the kindness of Mr. C. H. Taylor, who placed a very steep hill, situated on his private estate, Shelsley Walsh, at the disposal of the club, a very successful contest was run off on Saturday last, when out of thirty-eight starters thirty-five cars were timed at the top of the hill. The rise included about half a mile, with an average gradient of one in eight—a sufficiently severe test to mark the performances of the competing cars as meritorious. A silver cup for the car showing the best result under the handicap was presented by the club president, Mr. J. B. Dugdale, and another cup was given by Mr. H. C. Holder for the fastest time. Mr. G. F. Heath's 6-h.p. De Dion, driven by G. Patterson, secured the former, Mr. E. M. C. Instone, driving his 35-h.p. Daimler, winning the latter, with the time of 1 m. 17 $\frac{3}{4}$ s. The formula for horse-power by which the results were arrived at was as follows:—

$$H.P. = \frac{D^2 \times \sqrt{S} \times N}{5}$$

where D = cylinder bore (in) S = the stroke (in), and N = the number of cylinders. The results, according to the final formula, were as follows:—

Where the car was not driven by the entrant, the driver's name appears in brackets.

Place.	Car and Entrant.	H.P.	Time.	Points.
	h.p.		m. s.	
1	6 De Dion, G. F. Heath (G. Patterson) ...	4' 1	4 49 $\frac{1}{2}$	73

Derby Hill Climb.—On Saturday, under the auspices of the Derby A.C., a hill climb took place near Derby. Mr. Francis Bolton made the best time with his Daimler, Mr. Crowshaw Wilson, also on a Daimler, coming within four seconds of him. A handicap then followed, in which cars were sent off in heats of two, a time interval between the starting of each car providing in many cases some fine and close finishes, although in most cases the first car off was the first car home. The

Miss Larkins with her 6-h.p. Wolseley.

Mr. Luff Smith waiting for his turn upon his 12-h.p. Wolseley.

SHELSLEY WALSH HILL CLIMB. AT THE START.

first heats resulted as follows: Mr. Pole-Gell, 15-h.p. Darracq, 34s. start, beat Mr. C. J. Allin, the hon. secretary, 8-h.p. Humber; Mr. Francis Bolton, 15-h.p. Ryknield, 1m. 51s. start, beat Mr. Mell, 15-h.p. Darracq; Mr. C. T. Leech, 18-h.p. Daimler, with 71s. start, won from Mr. Wilson's 28-h.p. Daimler; Mr. G. B. Fletcher, 9-h.p. Mohawk, 2m. 5s., beat Mr. Reading, 10-h.p. Wolseley; Mr. Francis Bolton's 30-h.p. Daimler beat Mr. Dawson's Humber tricar; Mr. C. H. Smith, on his Lagonda tricar, beat Mr. R. W. Sale, on his 7½-h.p. Wolseley, 4m. 23s. start.

In the final, Mr. Bolton's Ryknield proved successful, Mr. Leech being second, and Mr. Fletcher third. In the class for cycles Mr. Bolton's nephew, driving a Clement Garrard, with 2m. 6s. start, took first place, with Mr. F. Smith, Clyde cycle, scratch, second, and Mr. Fryer, 33s. start, third. Mr. Leech and Mr. Allin started and timed respectively, and Dr. R. J. Arundel judged the winners of the heats.

MESSRS. C. S. ROLLS AND Co. announce that they have taken up the sole selling agency of the Hallé spring wheel—of which a description appears in our columns this week—and, by way of inauguration, a set of the wheels, fitted on a 20-h.p. Wolseley car, are being put through a road trial of about 4,000 miles under the

auspices of the A.C.G.B.I. The test started on Tuesday last, and will continue for 25 days.

AN attempt is to be made officially under the auspices of the A.C.G.B.I. by Mr. S. F. Edge on his 6-cylinder Napier, to lower the flying kilom., the standing kilom., and the standing mile records. At first either the Filey Sands or the sands at Weston-Super-Mare were chosen for the test, but the latter Mr. Edge thinks quite unsuitable, and at the moment of writing no locality had been fixed for the try.

THE Mablethorpe Beach Races are taking place to-day, Saturday, under the joint auspices of the Mablethorpe Amusement Committee and the Lincolnshire A.C. The programme will be started at 1.30 p.m., the chief events being a standing start handicap of 1 kilom. to be run in heats, and a time start handicap over the same distance. A considerable number of entries have already been secured, sufficient to ensure an interesting meeting, and every effort has been made for the comfort and convenience of all those who pay a visit to Mablethorpe for the racing. The Great Northern Railway Company are running a special service of trains, and it is intimated that ample accommodation will be found at the "Book in Hand," Louth, and Eagle Hotels.

Mr. Percy Martin has a nasty skid on his Daimler.

The most exciting skid of the meet. The 50-h.p. Italia has a hair-raising experience at "Hairpin" Corner.

SHELSLEY WALSH HILL CLIMB.

Liege Automobile Meeting.—After the usual formal reception on Monday of last week, and the visit to the Exhibition, a hill-climb on the Crickions Hill (average gradient 1 in 12) over 1 kilom., with a standing start, was run off on Wednesday, the 9th, in ideal weather. Hemery and Wagner, both on Darracq cars, were again successful in their efforts, running within $\frac{3}{4}$ sec. of each other, Wagner being timed for 43 secs. and Hemery 43 $\frac{3}{4}$ secs. In the Voiturette Class, Wagner's time, also on a Darracq, was 56 secs.; Hemery secured the Government prize with a time of 52 $\frac{1}{4}$ sec. for the hill.

In the Tourist Vehicle Class, for motor bicycles under 50 kilogs., Fagard was first in 60 $\frac{3}{4}$ secs. Bicycles over 50 kilogs (1) Reulaux (Peugeot), 81 $\frac{1}{4}$ secs.

In the class for cars over 20,000 francs (1), Rochet-Schneider, 1m. 31 $\frac{3}{4}$ s.

Chassis 15,000 to 20,000 francs (1), Metallurgique, 1m. 35 $\frac{1}{4}$ s.

Chassis 10,000 to 15,000 francs (1), Metallurgique, 2m. 7 $\frac{3}{4}$ s.

Chassis 5,000 to 10,000 francs (1), Vivinus, 2m. 39 $\frac{3}{4}$ s.

Chassis less than 5,000 francs (1), Metallurgique, 3m. 39 $\frac{1}{4}$ s.

Closed vehicles (1), De Cosmo, 5m. 4 $\frac{1}{4}$ s.

After some gymkhana items on the 10th, the Circuit for Tourist Cars took place on the 11th. The distance was 128 kiloms., with very nearly as many sharp turns and twists—32 cars and 10 motor cycles took part. A novel rule, to which we drew attention some time ago, was introduced into this event. Each competitor had to select beforehand at what average speed he would cover the full distance, and his choice determined the class in which he was placed. The specified speed had to be maintained throughout, timekeepers at frequent intervals—4 to 5 kiloms.—checking each car as it passed. Any variation upon the declared speed was penalised by debiting one point per second of difference. The winners in the various categories were:—

Cat. 1. Vehicles electing to travel at 15 to 24 kiloms. per hour, E. Dernier (Vivinus).

Cat. 2. 25 to 29 kiloms., Baillot (De Dion).

Cat. 3. 30 to 34 kiloms., Reuleaux (Mecanique).

Cat. 4. 35 to 39 kiloms., Lamarche (Metallurgique).

Cat. 5. Over 40 kiloms., R. de Macar.

Cat. 6. Motor bicycles (1), Dewandre (Sarolea); (2), Germaine (Antoine); (3), Fagard (Sarolea).

Coupe de Liedekerke.—The contest for this Challenge Cup took place on Sunday at Dinant. The course was 102.74 kiloms., which was covered four times = Total, 410.96 kiloms. In addition to the Cup for speed, a Team Cup for regularity was offered. Both these fell to the Pipe cars, the times of the classed cars being as follows:—

1. Hautvast (18-h.p. Pipe), 6h. 51m. 12s.
2. Fischer (15-h.p. Vivinus), 6h. 56m. 12s.
3. De Caters (16-h.p. Metallurgique), 7h. 31m. $\frac{1}{4}$ s.
4. Wilhelm (16-h.p. Metallurgique), 7h. 20m. 51s.
5. Kuhling (15-h.p. Vivinus), 7h. 23m. 49s.
6. Jenatzy (18-h.p. Pipe), 7h. 28m. 26s.
7. Van de Poel (18-h.p. Pipe), 7h. 43m. 21s.
8. Coquard (18-h.p. Aries), 8h. 4m. 1s.

A pneumatic tyre trial is proposed in France as a big event for next year.

At the Detroit Races, last week, Barney Oldfield had a serious spill when racing against Webb Jay on the White steam car. Earl Kiser has also come to grief when racing the "Bullet" on the Glenville track, Cleveland.

MOUNT Ventoux Hill-Climb has been postponed from September 1st and 2nd until September 16th and 17th, so as not to clash with other fixtures, and to enable competitors, during the Brescia Automobile week, more readily to take part.

It is not anticipated that the heavy vehicle trials just concluded in France, under the auspices of the A.C.F., will be repeated annually, but every other year. Therefore 1907 will probably be the next date for these trials, and for 1906 in all probability a 5,000-kilom. run for tourist cars will be organised in France.

Pyrenees Cup.—This tour will be about 1,300 kiloms. in daily laps of 200 kiloms., the start and finish being at Toulouse, whilst the itinerary will include Carcassonne, Perpignan, Beziers, Foix, Luchon, Cauterets, Biarritz, and Pau. *En route*, at these main points, fêtes are to be organised. The cars will be divided into six classes, according to their selling price, whilst the maximum horse-power for any motor is limited to 50-h.p.

THE ARDENNES RACE.—By the Winner of the First Race.

Heath, 1904.

Baron De Crawhez, 1903.

Charles Jarrott, 1902.

ARDENNES RACE.—The three winners of this race in previous years.

THE Ardennes Race has, to my mind, always been *the* race of the year. The conditions under which it is run, and the fact that the spectators are able to follow the position of each car at any point of the circuit, gives an interest to the event which is missing in all the events in which controls are fixed.

Our party on this occasion was a small one, consisting of Mr. Harvey and Mr. Willie du Cros, on a 50-h.p. Panhard, and myself, on my 22-h.p. Crossley.

In order to save time, we crossed from Dover to Calais on the Friday night prior to the race, and there found the 50-h.p. Panhard awaiting us at one o'clock in the morning to take us on to Boulogne, where we were staying for the remainder of the night, and from which place we were leaving at six o'clock for our run through to Belgium.

My own car was at Boulogne, and, consequently, for

some reason best known to the other members of the party, it was decided that I had to drive the 50-h.p. Panhard from Calais to Boulogne. The generosity of this idea can be appreciated when I say that the night was inky black, and the car was provided with a tiny oil lamp which helped but to make the darkness more intense. I am not quite clear how we got to Boulogne, because it was quite impossible to see the road, but I believe that part of the journey was made cross-country. As an interesting sequel, we landed somewhere at the top of the town in a little square full of turnings, and it seemed impossible to get out of this square, do what we might, as every time we made the attempt we seemed to land back at the spot from which we started. However, daylight breaking gave us an idea of where we ought to be, and we eventually landed up at Bailey's Hotel, thankful that our troubles had been

DRIVING TO THE ARDENNES RACE.

no worse. At 7 o'clock we were off again for St. Hubert, as we intended to make the run through in one day.

I must confess that the road is not particularly alluring for anyone intending to go to the Ardennes by this route, because a considerable portion of it is very narrow and winding.

Montreul, Hesdin, Mt. of Peronne, Hersan, Mezieres, Sedan, and on to the frontier, the passage being made easy by the aid of the papers obtained from the Automobile Club. Then a magnificent run over the Ardennes roads saw us landed safely in St. Hubert before dark—over 400 kiloms.—without a hitch of any description.

My Crossley was running perfectly, and on the straight stretches was averaging 60 kiloms. an hour comfortably, consequently the waits considerably made by the Panhard were not of very long duration.

St. Hubert saw us in the midst of the Panhard crowd. It was rather pleasant to meet once again some of the old racing brigade, who had retired from the heat of the fight, and had come to participate as spectators in a sport in which previously they had played a prominent part.

Amongst others at the hotel were the Chevalier René de Knyff, M. Lemoine, M. Prevost, Comte de Vogué,

of us from England over to see the event, namely, our own party, Mr. Kerr Seymour, that good sportsman and a friend of René de Knyff, and H. T. Arnott. It is certainly surprising that with the easy facilities for getting to the event that more of our sporting English automobilists did not turn up to see the great speed race of the year.

Everybody who is anybody was at Bastogne; cars of all sizes, makes, and conditions were running about in all directions, and the chances of the various competitors were eagerly discussed. I had a chat with the Baron de Caters, and was considerably surprised to hear that he had decided to start in the race, as he had been suffering from gout for some time past, and looked sufficiently ill as to make one doubt his capability of going through. However, he had made up his mind that he would attempt the race, and the only thing we could do was to wish him the best of luck.

Jenatzy appeared on his car, looking as demoniacal as usual, belching forth black smoke, and, in fact, most of the drivers in the race on the following day were to be seen either on or off their cars.

3.30 on the following morning saw us up and off to the start at Bastogne, 26 kiloms. from St. Hubert. On

Messrs. Charles Jarrott and Wm. Du Cros, Jun.

Messrs. Harvey and Willie Du Cros, with their *mechanicien*, watching the race.

Mr. Des Landes, Messrs. Du Cros Bros.' Paris Manager, discusses chances with Mr. Harvey Du Cros, Jun.

DRIVING TO THE ARDENNES RACE.

who had such a narrow escape when the Panhard boat sank which he was driving in the Monaco races; Teste and his faithful *mechanicien*, Artois; Tart, and Leblon, who was making his *debut* on a Panhard in the race. The hotel was full when we arrived there, and I was accommodated with a room by one of the villagers, spotlessly clean, and overlooking a breadth of forest of pine trees and open country spread out in a gloriously coloured panorama.

The excellence of the food served at the hotel was explained when I was informed that *chefs* from Paris had been specially engaged by the Panhard firm for the special preparation of food for the guests of the firm.

On the Sunday, a run round the course to Bastogne gave one an idea of the splendid arrangements which had been made by the Belgium Club for the event. No race has ever been run on a better course. It was certainly in a finer condition than any racecourse I have yet seen. The dust-laying preparations had been spread with a liberal hand, and everything had been done to secure the safety of the drivers and the spectators. The surface was beautifully smooth, and it was easy to anticipate that a battle royal at a big speed would take place.

Bastogne itself was full of people, and here I may mention as a point of interest that there were only five

this occasion, instead of having the start actually in the village of Bastogne, it was arranged at the foot of the long hill just before the village. The stand was built right across the road in the same way as the stand in Ireland, and gave the occupants an excellent chance of seeing the cars dash by beneath them.

The first car along the line was the C.G.V., driven by Behr. The timekeeper gave the signal to go, and immediately he raced the engine and dropped in the clutch. The car, instead of shooting forward, seemed to rise in the air and fall on its four wheels with a crash. Something in the gear had broken, and the car had to be dragged ignominiously off the course—to use an Irishism—finished before it had started.

All the other cars went away in excellent style.

In our opinion Gabriel made the best showing to the top of the hill, closely followed by Wagner and Jenatzy. 120 kiloms to go, and we calculated that the first car, *i.e.*, Hemery, would be round in about an hour and 15 minutes. To say that astonishment was caused by his appearance in 1 hour 5 mins. is to express one's self mildly. Everybody appeared to be stupefied, and the excitement was intense. We realised that the race was going to be fought out to a bitter finish, and that at a terrific speed.

Passing through Pironne on the way to the Ardennes. Mr. Jarrott on his 18-h.p. Crossley, and Messrs. Du Cros on their 50-h.p. Panhard.

Outside the Hotel Beiron, Rochefort.

The Panhard Control at Neufchateau. M. Rene de Knyff is at the end of the group of three.

DRIVING TO THE ARDENNES RACE.

Jenatzy came down the hill like a shot out of a gun, and caused a sensation with the manner in which he disappeared under the stand placed across the road.

Rougier, on the De Dietrich, was also going magnificently, and it eventually turned out that he accomplished the fastest circuit in the race—1 hr. 4 mins. for 120 kiloms. After the cars had passed we made our way back to our cars, and cut across country to Neufchateau, where there was a big De Dietrich, Panhard, and Darracq depôt. We arrived just in time to see Heath arrive for replenishment of petrol, lubricating oil, &c., and here we were able to appreciate one of the smartest pieces of work I have ever witnessed in this direction. From the time the car was stationary to the time it was started again was exactly 1 min. 25 secs. In that time the petrol tank had been refilled, lubricating tank had been also replenished, the driver had been given food, and the car had been generally looked over.

Teste arrived just before Heath got away, and he was sent off in even quicker time, namely, 1m. 18s., so that on this particular point undoubtedly the Panhard gained considerable advantage for their smartness. The story of the drivers, however, was that of continual tyre troubles; in fact, the story of the race on the part of every driver was the trouble he had had in connection with his pneumatics.

Leblon had three punctures in the first round, a small indication of the manner in which he must have driven to have finished in third position; in fact, as far as one could gather, the whole question now—owing to the power of the cars utilised in racing—appears to be one

entirely of tyres, the man having the best luck in this direction being the winner. I have no doubt that Hemery had a big advantage in this direction with his light Darracq, especially in view of the fact that Tart on the last round at Neufchateau was only one minute behind him, and had been gaining ground rapidly. It is reasonable to suppose that if Tart had not been so unfortunate as to have punctured again in the last few kilometers that he would have overhauled Hemery and been the winner of the race.

Teste was making excellent time, but only at one period did he appear at all dangerous.

The Baron de Türckheim said he had received news of Gabriel, and whilst he was talking to me Gabriel appeared with his mechanicien, having smashed up his car at St. Hubert. The accident was due entirely to himself through endeavouring to take a corner too fast. His description of the accident was somewhat graphic, and he explained that he was flung out of the car into a hedge, and saw something black passing over him which afterwards turned out to be the car, which was smashed to fragments—giving a slight indication of the very narrow escape he had. His mechanicien appeared particularly joyful at having escaped with his life, and in a corner of the tent was performing a little step-dance to show that he was sound in body and uninjured. However, both of them felt the effects of the smash, and before I left were lying down in the tent somewhat subdued and rather stiff and sore.

Rougier on his De Dietrich, we heard, had broken his clutch-pedal, a very small thing but impossible to repair,

At the Panhard Control. Baron Henri de Rothschild and Ch. Rene de Knyff watching Heath's "quick change." Gabriel, none the worse for his accident, is also interested. His gaitered leg can just be seen beyond M. de Knyff.

Wagner filling up at the Darracq Control.

Heath's "quick change" in the Panhard Control. In 1 min. 35 secs. he replenished with 100 litres of petrol, 10 litres of lubricating oil, refilled with water, and both he and his mechanicien had a record "quick lunch."

AT THE ARDENNES RACE.

and his magnificent dash in the first two laps was rendered quite useless.

Duray was travelling well, but had a lot of trouble with his tyres; in fact, as I have before mentioned, it was a tale of tyre troubles all the way through.

Jenatzy on his Mercedes, punctured, and endeavouring to reach the next control on a flat tyre, hammered up his rim to such an extent that it was impossible to fit a new cover. He had travelled well, and completed the first circuit in 1h. 6m.

A dash back from Neufchateau to Bastogne for the finish gave us a chance of trying the paces of the "50" over a portion of the old racing course which I know so well from my 1902 race. With a four-seated body and four up, we clocked 32 secs. for the kilom., and the 26 kiloms. were accomplished in 19m.

Close on behind our heels came de Knyff on the spare racing car, considerably anxious as to the result.

The question was, Who would arrive first, Hemery or Tart?

We did not know then that Tart was to have tyre troubles in the last 60 kiloms. After a wait of ten minutes, the bugle was heard, and a grand piece of racing was witnessed. Hemery, finishing, was being chased six inches away by Leblon just starting on his last round, he having started last and Hemery having started second.

The two cars crossed the tape practically locked together, travelling at a speed of over 90 miles an hour, and the effect was thrilling.

The next question was as to whether Tart would finish within the time limit, and thus beat Hemery. Exactly half an hour had to elapse after Hemery finished, in which time, if Tart had finished, he would have been the actual winner of the race, but he did not arrive and time went on, and as we stood with stop-watches in our hands, everyone was feverishly excited as to what would result. However, he did not appear, and Hemery won one of the hardest fought races on record at an average speed of over 62 miles an hour.

A great race worth travelling a long way to see.

Tart eventually finished in 6h. 13m., with Leblon, who had driven a very fine race in view of the troubles he had had with his tyres, in 6h. 22m.

Heath, who last year won the event in 6½ hours, only finished fifth, although he beat his last year's time by over 6m.

Immediately after the race we started back for the coast, the Crossley being allowed a little start. After a splendid run without incident, we were successful in making Hersan the same evening, and up early the following morning saw us in Boulogne at three o'clock in the afternoon, enabling us to be back in London on the evening of the day following the race.

It is always very interesting to me to go over to the Ardennes, as evidently the fact of having won the first race has apparently turned me into a local character. Certainly a great many more people knew me than I myself knew, but this made everything the more pleasant, and I only hope that interest in racing will secure a perpetuity of a race over a course which is, as at present arranged, the finest racing course in the world.

It is very interesting to notice in connection with the Ardennes the growth of speed.

In 1902, my own average was 53 miles an hour; in 1903, when the race was won by the Baron de Crawhez, 54 miles an hour; in 1904, when Heath was the winner, there was an average of over 57 miles an hour; and in 1905, Hemery put up the astounding performance of averaging 62 miles an hour; and one is almost compelled to ask the question—when will increase of speed cease?

L'ENTENTE CORDIALE.—The French naval officers leaving the Grand Hotel, Northumberland Avenue, on motor cars on Sunday last for their trip to Maidenhead. The view was secured from the Victoria Hotel.

Questions in the House.—Mr. Channing, who is one of the less important members of the virulent anti-motorist phalanx in the House of Commons has been asking the President of the Local Government Board whether the reference to the Motor Car Royal Commission would include inquiry into the increased wear and tear caused to the roads by motors, and the cost to the rates, &c., of the extra police required "to better enforce the law," and whether he would address a circular letter to local authorities asking for statistics on these points. Mr. G. Balfour's reply was short and to the point:—That the terms of reference were sufficiently wide, and that it rested with the Commission to decide what information they will ask for. Mr. Channing also similarly questioned the Chancellor of the Exchequer, merely adding a query as to the approximate cost involved. In reply, Mr. A. Chamberlain refused in any way to anticipate the Budget for next year.

with the numerous cars which are on view prior to the periodic sales, two of which are held every week.

The new premises, of which our photographs give some idea, are among the most elaborate of their kind which we have seen, and the ornate decoration with which the interior is finished, and the convenience of the general arrangement of the building itself, are a welcome change to what is generally associated with the popular idea of an auction showroom. A feature worthy of comment is the flooring of this new building, which is constructed of an asbestos compound, one inch in thickness—a precaution against fire which will be easily appreciated.

While there are always a large selection of high-class cars on view, it occasionally happens that what might almost be termed historic vehicles are included among them. On the occasion of a recent visit, for instance, we noticed an 80-h.p. Mors, now fitted with handsome touring body, formerly the property of the Duke of Manchester—who has personally attended at these sales—but better known when, as a racing car, it was driven by the Hon. C. S. Rolls. Another Mors, at one time owned by Baron de Caters—who is almost as well known on this side of the Channel as on his own—was also in this incongruous but catholic collection of motor vehicles, both new and old, which range in power from some diminutive voiturette of almost forgotten make to the latest production of the Mercedes factory in the shape of a brand new 60-h.p. chassis.

A MOTOR AUCTION ESTABLISHMENT.—Outside view of the new premises of The Motor House in Euston Road.

Second-Hand Cars.—To many motorists their first really practical experience of the art of motoring as a pastime, came with the purchase of a second-hand car. It is, perhaps, of all ways, the most direct and the most certain in which to learn the broader meaning of the term "motorist," and if, perchance, the tales of those who entered the ranks by this door are not untinged with woe, there are, nevertheless, very few who are ever heard to express regret at having followed such a very time-honoured custom. Now-a-days, the pastime has assumed such proportions, and the fancies of the wealthy vary with such rapidity, that in many instances there is very little difference between a second-hand car and the brand-new article but the price.

One of the best possible indications of the growth of automobilism may be found in the magnitude of the businesses connected, either solely or in part, with the sale of second-hand cars. Among these that conducted at the Motor House, under the management of Mr. Easton, is unquestionably one of the largest and most varied in the world. To such an extent has their business increased that they have just opened most extensive premises—almost adjoining their original showrooms in Euston Road—exclusively for four-cylinder cars. Together with the old site the floor space is almost one acre in area, but even this always appears to be comfortably crowded

ONE of the daily papers has signalled itself by producing the following cutting:—

Mr. Edison states that his storage battery, which he has now perfected, will drive a 2-ton truck at the rate of 33 miles an hour, at a cost of 58 per cent. of the sum necessary to maintain a horse. The battery will enable an automobile, under favourable conditions, to run 150 miles on one charge. Mr. Edison is building an immense factory wherein to manufacture the batteries.

We have heard so little about the Edison battery lately that this is positively refreshing. We only trust that it is not a paragraph that was written out during the original boom, pigeon-holed at the time, and recently dug up by a rummaging sub-editor.

Interior view of one of the extensive rooms in the new premises of The Motor House.

company, a 20-seated Arrol-Johnston char-a-banc having been selected for the purpose.

LOYAL fears for the safety of His Majesty have been aroused in the hearts of the subjects of the King of Siam by that monarch's enthusiastic addiction to automobilism, and his ministers have accordingly petitioned him to refrain from that "risky" mode of locomotion. The King, however, has evidently the profoundest faith in the reliability of his cars, as he has replied that "Danger lieth not in the motors, but in the hearts of men!"

Bank Lane, Kingston-on-Thames, the first road to be closed in England to motor vehicles under the powers of the Local Government Board. Notice has been issued by the L.G.B. that a "person shall not drive a motor car on the highway within the Borough of Kingston-on-Thames, which consists of the street known as Bank Lane." The Order comes into force on August 28th. Bank Lane leads out of Lower Ham Road, at which point our view is taken.

THE Automobile Club of Milan has been invited by the Italian War Minister to furnish a number of automobiles to take part in the military manoeuvres, to be held in Abruzzi, in the presence of the King, on the 23rd and 24th inst. Fourteen members of the club have offered to place cars at the Minister's disposal.

THE Postmaster-General reports that he has considerably extended the employment of automobile transport by the G.P.O. In addition to the services to which we have already referred, others have been established between Birmingham and Worcester, Newcastle and Sunderland, and Northampton and Hitchin. The employment of the motor vans has resulted in acceleration of the services, and where heavy loads are carried, in substantial economy.

THE leading members of English society are certainly now giving the most satisfactory preference to the British-built car, and if any confirmation of this statement is required it is provided by recent experiences at the show rooms of Messrs. S. F. Edge, Limited. Within a short period, Prince Arthur of Connaught has purchased both a two-cylinder and four-cylinder car, while in a single afternoon orders were received from H.R.H. the Duke of Connaught for a six-cylinder car (H.R.H. was the purchaser of the first car of this build which the Napier firm produced), from the Speaker of the House of Commons who ordered an 18-h.p. landaulette, and from Lady de Grey, who gave a similar order, while Lord de Ramsey within a few months has purchased both a 24-h.p. and a six-cylinder Napier car.

NEW CUMNOCK, Ayrshire, has now a motor car service instituted by a local

THERE is a great difference between the meaning of the words "axis" and "axle," but the difference has not been "revealed unto" a certain coloured preacher in America, who having learned that the earth "revolves on its axis," has jumped to the conclusion that the oil-wells, which supply the citizens of the United States with fuel for motor cars, and punishing objectionable negroes, were designed by the "Author of the Universe" for oiling the earth's axle (or axis). Motor cars, the coloured preacher thinks, have been using up all the supply of natural oil, and hence the earth's axle (or axis) creaks, a state of affairs which gives rise to earthquakes. Perhaps if some kind person would explain to the "coloured preacher" that the axis (or axle) turns round with the earth he would realise that lubrication is not needed, and be reconciled to the arrangement as an example of the divine government of the universe and a proof of design in Nature!

A FIVE-MILE per hour speed limit upon motor cars, when travelling through Middle Street, Horsham, has been announced by the Local Government Board. The Order takes effect from September 4th next.

THE CLOSING OF BANK LANE, KINGSTON, TO MOTOR CAR TRAFFIC.—Lower Ham Road, showing Bank Lane leading out on the right. This lane is about 190 yards long, is about 16 feet wide where it joins with Lower Ham Road, and narrows in the centre to about 13 feet. From the centre of the lane, a wide residential road comes in at right angles.

NEW COMPANIES REGISTERED.

Automobiles Corre (Limited).—Capital, £40,000 in £1 shares (26,000 six per cent. preference). Object, to acquire the business of Jean Corre, 37, Rue de Villiers, Neuilly-sur-Seine. First directors, P. Baxter (chairman) and J. Corre.

D. Doyle (Limited).—Capital, £2,000 in £1 shares. Object, to adopt an agreement with D. Doyle, of Nelscn House, 9, Charing Cross Road, W.C., and to manufacture and deal in electric, petrol, oil, gas, and other cars, coaches, &c. First director, D. Doyle (managing director).

Oliver, Morris, and Ball (Limited), Grosvenor Works, Mount Ephraim, Tunbridge Wells.—Capital, £25,000 in 10,000 "A" preference and 14,500 "B" preference shares of £1 each and 10,000 ordinary shares of 1s. each. Object, to acquire Messrs. Oliver and Morris's carriage building business, Grosvenor Works, Mount Ephraim, Tunbridge Wells, and to carry on the business of coachbuilders, dealers in motor cars, &c. First directors, A. Oliver, G. Morris, and E. B. Ball.

W. G. Haywood and Company (Limited), 56, High Street, Bloomsbury, W.C.—Capital, £2,500 in £1 shares. Object, to acquire from W. G. Haywood and Co. the sole retail agency in Great Britain and Ireland for the sale of motors and motor cycles manufactured by V. Antoine Fils et Cie, of Liège, Belgium. First directors, W. G. Haywood and S. G. Brounger.

Howard T. Wright Brothers (Limited).—Capital, £10,000 in £1 shares (7,500 preference). Object, to acquire from H. T. Wright an invention of a method of driving turbines by gas or hot air. First directors, H. C. Walker, H. T. Wright, and J. B. Nicholson.

Motor-Bus Advertising Company (Limited), Bright's Buildings, 110, John Bright Street, Birmingham.—Capital, £2,500 in £1 shares. Object, to acquire the leases of advertising right on the motor-omnibuses belonging to the London Motor-Omnibus Company (Limited), as granted by the company to A. Fletcher, of Birmingham. First directors, A. Fletcher (managing director), F. Mason, and E. W. Beech.

A SNAP AT BLACKPOOL RACES.—Miss Dorothy Levitt, in the midst of the racing, is keenly alive to the absorbing interest of "The Automotor Journal."

ILLUSTRATION, next to demonstration, is the surest means of explanation, and so far as this means can be made useful, it has been by the well got-up little booklet on tyre repair which is issued by the Continental Tyre Company. There are no less than twenty-four views, illustrating the various operations in changing an inner tube or cover, and to anyone who is unfamiliar with the process they should be invaluable, while to many who consider their doubtless rev

We are informed that the Receiver and Manager of the Motor Manufacturing Company has sold the motor car works at Coventry known as the Motor Mills, together with a portion of the machinery, to the Daimler Motor Company, and is taking new works, where the M.M.C. business will be carried on as heretofore. Progressive possession will be given to the Daimler Company to enable the M.M.C. business and completion of the orders in hand to be carried on without interruption, pending the installation of the M.M.C. business in their new works.

To obtain the grant of a Royal Warrant of appointment as Motor Manufacturers is no mean achievement at the present time. Messrs. John L. Thornycroft and Co., Ltd., have succeeded in this difficult task, after having supplied the above fine specimen of a motor carriage to H.R.H. Princess Christian. In recognition of her pleasure with her acquisition, H.R.H. honoured the Company with her official recognition in this manner.

THE British Empire Motor Trades Alliance has received an enquiry for the names and addresses of British firms who manufacture chassis, pressed steel or armoured wood, wheel base about 7 ft. 6 in., Cardan drive, three speeds and reverse, direct drive on top speed, artillery wheels 30 ins. by 3½ ins. (750 × 85), for tonneau body, four seats, 10-12-h.p. 4-cylinder engine, with tank, coil, accumulators, radiator, etc., or engine separate.

THE Dorking Motor Garage has been established at 64A, South Street, by Mr. Cecil J. Tracy. Motoring visitors have increased in Dorking of late, the exquisite country abounding in the vicinity attracting daily more and more lovers of Nature's beauties. The garage is on the main road to Horsham, Worthing, and Eastbourne, and is next door to the General Post Office at Dorking. Accommodation is afforded for about 40 cars, and ample provision has been made for rapid repairs. Accumulator re-charging is a feature, and petrol, lubricating oils, tyres, and accessories of all kinds are stocked. The agency for the Crypto car has, we understand, been secured by Mr. Tracy.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E. Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

9136. 1st May, 1905. Improvements in or relating to the Clutch Mechanism and Reversing Gear of Motor Vehicles. Georges Ville, 23, Rue Jenner, Paris. Date under International Convention, 5th May, 1904. This apparatus relates to apparatus for controlling the clutch mechanism and the reversing gear of motor vehicles by the combined use of a pedal and a hand lever. There are two figures. Fig. 1 is a longitudinal elevation with sections through the essential parts. The pedal, *b*, arranged on the spindle, *a*, acts on the one hand by means of an arm with a roller, *c*, on a fork, *d*, for shifting the clutch cone, *e*, co-operating with the flywheel, *v*, of the engine, and by means of a second

pivoted at a fixed point to the case, *g*, containing the change-speed gear, the fork, *d*, having rollers acting against a collar secured to the coupling cone, *e*. Through this fork passes an adjustable screw, *o*, secured to a plate, *s*, against which rests the roller of the arm *c*, controlled by the pedal, *b*. The fork is connected above the screw, *o*, to a rod, *t*, terminating at the opposite end in a link, *u*, arranged transversely on the spindle, passing through the spindle, *a*, and secured to another lever, *y*, arranged outside the lever, *b*. This lever, *y*, is intended to effect or to maintain for a certain length of time the unclutching of the motor, and when it is caused to swing to the end of its movement it also acts on the brake. The spindle of the lever, *y*, is secured to a cam, *z*, acting by its boss on a projection secured to the link, *u*. The sleeve of the cam, *z*, carries an arm, *a*¹, to which is connected the rod, *w*, of the band brake, *b*¹, acting on a drum, *c*¹, of the transmission gear. When it is desired to obtain instantaneous throwing out of gear or reversing it is merely necessary to push the pedal, *b*, and accor-

fabriks Aktiengesellschaft, Budapest, Hungary. Date under International Convention, 25th July, 1903. Friction clutches, as hitherto constructed, which transmit power by means of spiral springs only permit, when but a single spring is employed, of the rotation of the shaft in one direction, whilst in accordance with this invention, even if only one spiral spring is employed, the shaft may be rotated in both directions in exactly the same manner. The transmission of the power takes place by friction which is produced upon the inner or the outer face respectively of a spiral spring arranged between the two clutch members. There are six figures. In Figures 1 and 2 the clutch member, A, is turned conically internally, whilst the clutch member, B, is of cylindrical form. The spiral spring, C, bearing upon the periphery of the cylindrical clutch member, B, is conical upon the outer periphery, but is not rigidly connected to the member, B. The two ends of the spiral spring rest against the stops, *k* and *n*, forced on the clutch member, B, in such a manner that it is able to slide or become compressed or extended by the amount of play afforded by the stops. Between the inner face of the spiral spring and the outer cylindrical periphery of the clutch member, B, there is but very slight play. The clutch member, B, is displaceably mounted upon the shaft, but rotates with the latter, whilst the part, A, is mounted fast upon the shaft. By displacing the clutch member, B, in the left hand direction, the spiral spring comes into contact with the inner face of A, and friction is set up between the former and the clutch member, A, so that both the spiral spring and the plate, B, are driven, the latter, by means of the stops, *k* and *n*, according to the direction of rotation of A.—July 27th, 1905.

PASSING EVENTS.

Drivers' Training Schools—A Right Move.

THE situation as regards the supply of competent motor car drivers is becoming more and more acute, not to say absurd. While good and competent chauffeurs are at a premium, and almost unprocurable, incompetents whose only qualification for the post they desire to fill is that same desire to fill it, are as plentiful as blackberries in autumn, leaves in Valombrosa, or winks at a Sunday School treat. A sad example of this is provided by the case of a correspondent who recently advertised for a chauffeur. He had some seventy replies, but amongst them not one that any car-owner with an affection for his car, or respect for the safety of the public would have thought of engaging. The seventy were composed of two approximately equal battalions—boys just old enough to be granted a licence, and elderly incompetents whose doubtful eyesight could scarcely have been relied on to distinguish a policeman from a "road hog." They were the output, of course, of some of the many so-called training institutes for chauffeurs, on whose delinquencies it has been our duty to comment from time to time.

Now this driving-school business is becoming a very serious matter. There is plenty of room for really *bona*

fide institutes of the sort which would turn out trusty and reliable drivers whose certificates could be depended upon. Too many of them, alas, as has been pointed out in our columns, and in other papers, are little better than traps for the unwary aspirants to drivership who pay fees they can ill afford, to learn nothing or less than nothing, and traps for employers who may be beguiled into employing the incompetents these fraudulent institutions turn out. At the same time, there are teaching institutes which do really good work and benefit the automobile community. The great thing is that it should be possible to distinguish the sheep from the goats, and the Motor Union are, therefore, to be heartily congratulated on having determined to prepare a "recommended list" of schools, firms, and institutions, undertaking the training of motor car drivers. Any institutions that desire to be placed on this list should communicate with the secretary of the Union, giving full particulars, and the Union will then make such enquiries as will enable them to decide whether the institute in question should be placed upon their list. The value of such a list is obvious. Intending learners will be sure that in becoming members of one of those whose names appear upon it they will be getting value for their money, and employers will feel some degree of confidence that in trusting their automobiles to the *alumni* of such institutions there will be no danger of the milestones in their immediate neighbourhood becoming embellished with their principal constituent parts.

The Light Delivery Vans Trials.

THE reliability trial for light motor delivery vans, which are to extend over five weeks during the months of September and October, and are now officially announced to commence on the 16th of next month, have not been an unmitigated success as regards the number of competitors who have entered vehicles for it. We confess we are largely disappointed. The motor delivery van promises to form one of the most important and generally useful branches of the automobile industry, and yet, when the Automobile Club organises an elaborate trial which will be carried out through twenty-three different counties, and so present a unique opportunity to the competitors of showing what their vans can do to a widely-distributed circle of spectators, the number of entrants is practically insignificant. To some extent this is no doubt due, as pointed out by Mr. Frederic Coleman (in a letter which we have received from him), to the fact that the trials follow much too closely on the heels of the Tourist Trophy in the Isle of Man, a circumstance which makes it difficult for firms to enter for both events unless they possess an enormous, and for ordinary purposes a somewhat superfluous, staff, and also to the frequent alterations of date of which the event has been the victim. This is decidedly bad stage-management. Similar reasons, it has been stated, account for the absence of Messrs. Thornycroft from the competition. Considering that of the actual entries several are by foreign manufacturers, the result is not calculated to produce a very favourable impression of British manufacturing enterprise, and the actual state of development of British commercial vehicles, since the general public can hardly be expected to take the special circumstances of the case into account. In fact, the false impression is likely to gain ground that the lead held by Great Britain in this department has become a thing of the past. A

further cause of the small number of entries no doubt has been the limitation to 30 cwt. loads—a limitation not originally contemplated, and one which has unfavourably differentiated the English van trials from the corresponding French competition. When next a similar competition is organised, it is to be hoped that the club will see to it that the wind is not taken out of its sails by arranging it immediately to follow an even more comprehensive event.

An Opening for the Motor Boat?

SOME time ago the Basingstoke Canal, the company owning which has been for many years in liquidation and Chancery, was put up for auction, but though the eloquence of the auctioneer alternately rattled the windows and nearly reduced his somewhat scanty audience to tears, and though the picture he painted of the scenery through which the canal passes quite justifiably recalled the classical descriptions of Arcadia and the Vale of Tempe rolled into one, he failed to obtain a single bid. Now, however, the derelict canal has found a purchaser in the person of a wealthy merchant, Mr. William Carter, residing between Poole and Bournemouth. When the unsuccessful attempt at selling the canal was made before, we put forward the suggestion that it might pay someone to buy it up and adapt it as a pleasure run for motor boats. We are delighted to learn that this is precisely what Mr. Carter states that he intends to do with it. We sincerely trust he will be successful. The Basingstoke Canal leaves the Wey Navigation Canal shortly above the beautiful sweep of wood-surrounded meadows on the south-west of Weybridge, and runs through some of the most exquisite woodland scenery in Surrey. We are glad to find, too, that Mr. Carter contemplates developing a motor boat delivery and passenger service on the canal, as well as adapting it for pleasure boating purposes. A large part of the canal runs through a district very imperfectly serviced by the railway, so that Mr. Carter's scheme should provide a good test of what the motor boat can effect for commercial purposes. Should he fail in this scheme, Mr. Carter holds out the awful threat of turning the canal into a line of light railway, so we hope for every reason that he will not fail.

The Royal Commission on Motor Traffic.

OUR readers will call to mind that sub-committees, both of the Automobile Club and the Motor Union, were a short time ago appointed to prepare the motorists' case, and to assist the Royal Commission on motor traffic by placing evidence before it. Since last week, however, a much better arrangement has been come to. Instead of two sub-committees of the two great automobile bodies, more or less effectively and cordially co-operating with one another, it has been arranged by these two committees to act as a Joint Committee in presenting the automobilists' case. This Joint Committee is under the presidency of the Hon. Arthur Stanley, M.P., and consists of the following members:—The Rt. Hon. Earl Russell, the Hon. Scott Montagu, M.P., and Messrs. C. Johnson, E. H. Cozens-Hardy, and Stanley Spooner, representing the A.C.G.B.I. Messrs. A. A. Dale, G. T. Langridge, C. H. Dodd, E. Shrapnell Smith, and Granville M. Kenyon, representing the Motor Union. The result of this appointment will be to ensure absolutely cordial co-operation between the two great bodies, and

C

to make certain that the necessary evidence is placed before the Commission in the most effective and convincing manner possible.

Individual Co-operation and Assistance Needed.

BUT the Committee, however able and however representative, must be supported, and supported enthusiastically by the great body of motorists throughout the kingdom. The Committee will have the most important and difficult bit of work to carry out which it has ever fallen to the lot of any body of men representing the automobile movement to have to undertake. As we have already explained (in previous issues) the whole future of the movement may without exaggeration be said to be in the melting-pot, and the manner in which it will be moulded ultimately depends on the Royal Commission. Their report will without any question determine the next motor car law. Even in the event of a general election and the return of a Liberal Government to power occurring in the meantime, the findings of the Commission will be practically as certain to form the basis of future legislation as if the present Government remained in power.

Now, we have every confidence in the absolute impartiality of the Commission. But they must have all the arguments and all the facts ably put before them. The opponents of the automobile movement are powerful and energetic, and we may trust them to put before the Commission everything that can be brought forward to the prejudice of the new locomotion. It is essential, therefore, that the case from the automobilist's point of view shall be marshalled with convincing cogency. The arguments needed can, perhaps, be left to the Joint Committee and to the Parliamentary and legal members of the Automobile Club, but the accumulation of the necessary array of facts can be very largely contributed to by individual automobilists. Above all, individual motorists can contribute to what will undoubtedly prove to be the very heavy expenses of the Committee. It is most important that they should do both.

Wherever anyone is acquainted with facts illustrating the unsatisfactory working of the existing Motor Car Acts, the manner in which they occasion hardship and injustice to individuals and the respects in which they wholly fail to effect the objects desired at the time when they were passed into law, he should at once communicate them to the Committee, and from now on he should be on the look-out for similar data. Examples of magisterial injustice and prejudice and of the frequently unfair methods adopted by the police, are all of value. Of even greater value will be any evidence with which individuals may be acquainted of the advantages brought by the automobile to different districts or communities, either as a means of communication, or as an influence which has had the effect of creating or improving the value of property. Instances of this kind will be of great assistance to the Committee, for though that body is in possession of a great deal of such information, they can hardly have too much, and in these sort of matters, next to the quality, it is the volume of the evidence that tells.

But Finances Even More Important.

BUT whether he can or cannot assist the Joint Committee in the manner described above, every automobilist in the kingdom ought to contribute according to his means to the funds on which the Committee will have to draw. Great expenditure will be involved. A large number

of people will have to be employed, not merely in doing staff and clerical work and in collecting information and statistics, but in prosecuting local enquiries, cross-examining town and country residents, and generally acting as scouts and skirmishers for the Committee, and it is only enthusiasts who can be induced to do this sort of work without being paid for it. It is an opportunity which no one should neglect, and every automobilist in the country who fails to assist the Joint Committee, either by his own co-operation, the provision of evidence for which he himself can vouch, or subscribing to the necessary funds (or preferably by all three courses of action combined), is simply a short-sighted traitor to the automobile cause.

A satisfactory financial nucleus has already been formed. The A.C.G.B.I. has contributed £500 to the "Legislation Fund" of the Joint Committee, and £400 has been allocated to the same purpose by the Motor Union from its legislative war chest. Much more, however, is needed, and Mr. Rees Jeffreys, the enthusiastic and administratively capable secretary of the Joint Committee, is making an appeal to which it is to be hoped a hearty and universal response will be accorded. It is a situation in which the hackneyed line, "Pay, pay, pay," has a very real and personally apposite significance.

Proposals.

THERE are two directions in which the Joint Committee will be in a position to render valuable assistance to the Royal Commission in taking what we are certain it is their desire to do—an enlightened and far-seeing view of the whole situation—a view which may form the basis for legislation which will insure the future satisfactory development of the automobile movement, and at the same time adequately safeguard the interests of the general public. It is this that we all hope will be the result of the work of the Royal Commission, for it will mean not only prosperity to the automobile movement but prosperity to the country generally and the removal of a number of incessant and irritating causes of friction between the police and a class who have always been supporters of law and order.

The two directions to which we refer in which the Joint Committee can assist the Royal Commission, are (1) providing a comprehensive and well-digested collection of evidence and facts bearing on the situation as it is at present and the operation of the Motor Car Acts; and (2) putting forward suggestions for modifications in the existing laws.

It is perhaps premature for us to go into these points in detail at present, and in any case forming decisions upon them is specially the work of the Joint Committee, so that in anything we may have to urge now or in future, we would be understood merely as making suggestions for the Committee's consideration.

Principal amongst the matters which the Committee will press upon the Royal Commission as essential features of future legislation will no doubt be the abolishment of a specific speed limit (reliance for the safety of the public being placed in a general clause), the introduction of a clause compelling notice of intended prosecution to be given at the time an offence is said to be committed (or *immediately* afterwards), and means for getting rid of that crowning absurdity of the present Act, which compels magistrates to endorse licences for trivial offences whether they wish to do so or not.

HERKOMER TROPHY.

*(From Our Correspondent.)***HERKOMER TROPHY.**—The official scoring board over the Forstenrieder Park Course.

THE chief Continental event of the year for touring cars has been brought to a successful conclusion by the Bavarian Automobile Club, acting in conjunction with the Deutscher Automobile Club, and there is no doubt that the Herkomer Trophy may henceforth be counted among the yearly motoring fixtures of each. The competition began in a downpour of rain at the Kesselberg on last Saturday week, and ended the following Wednesday in a plague of dust. But despite the heat and unnecessary fast driving indulged in by the bulk of the competitors, no fewer than sixty-nine or seventy-nine starters entered Munich at the conclusion of the tour, thirty-four of them without a single mark of any sort against them. Had the question of tyres been ignored—as in the case of the trials organised by the A.C.G.B.I.—the percentages of success would certainly have been half again as much, such well-known drivers as Max von Martini, with his

40-h.p. machine, being completely out of the running on the third day by the mere fact of a puncture that occurred at a moment when his chances of carrying off the trophy were the brightest; while the British team of five Daimlers does not figure in the first dozen places for the sole reason of tyre troubles. The machines had run perfectly throughout, and by their striking performances at the Kesselberg—where third, fourth, sixth and eleventh places were secured in an event that was practically a local one, in that it was impossible to drive at a maximum pace without being familiar with the road—and at the speed trials on the flat on Sunday they carried everything before them, Mrs. Manville making faster time than any other competitor in any class whatever, Mr. Manville being second, Mr. Frank Rendle (driver, Mr. Albert Bush) third, and Mr. Philip Dawson fourth, each on a 35-h.p. Daimler. In the combined hill-

climbing and speed-trial events Mr. Manville came out first, Mr. Bush second, Mrs. Manville fourth, and Mr. W. Herdman Ash, with his "gallant little twenty-eight," eleventh.

Of red tape there had been practically none, while as regards the course, nothing so perfect as the manner of keeping it clear has ever been achieved. In a tour of over 600 miles, two ox-wagons and two carriages were the only vehicles encountered, nor did these in any way cause a moment's delay or trouble to the competitors. Another point, too, concerns the arrangements made for supplying medical aid. In the event of an accident occurring at any point of the route properly qualified persons with a full equipment were always waiting within three hundred yards of the spot.

In connection with the start in the Landsbergerstrasse at daybreak Monday morning, it is to be noted that certain cars, to which awards were made at the exhibition on Thursday and Friday of last week for the luxuriousness of their coach work, never ran in the trial at all, a policy for which the Bavarian Automobile Club was plainly never

Prince Ludwig Ferdinand
von Bayern in Forstenrieder Park.

prepared, else it would have made some provision whereby such machines should not be entitled to receive any mark whatever in a scheme designed specially for discovering the most desirable car proper. Clad in a great coat and looking very frail, the veteran American sportsman, Clarence Gray Dinsmore, sat on his 70-h.p. Mercedes, with Werner, of Gordon-Bennett fame, at the wheel, and was the first to receive the signal to start, the machine being the most powerful of those actually sent off. The rest were dispatched in the numerical order of the programme.

A white fog lay over the land during the first twenty kilometres, then the sun broke through, lighting up fir clumps and green fields. The early hour of the morning did not deter the local enthusiasts from lining the route throughout, the interval on the road between towns and villages being as thickly studded with onlookers as the most populous parts themselves. An hour had not passed before it was plain that a great number of the competitors were determined to regard the run as a race pure and simple. And, be it recorded, so it remained throughout.

HERKOMER TROPHY.

One of the serpentine roads of the Kesselberg, as seen from the public "Grand Stand."

This is one point in which the organisation fell short of the ideal, but the responsible party cannot be held to blame, because, like the A.C.G.B.I., it had fixed minimum times between stages.

The only satisfactory point of view in what happened can be regarded, is that all the machines, of which so high a percentage came through without trouble of any sort, underwent a vastly more severe test than they could possibly have done had more reasonable tactics been pursued. Imagine a string of cars bouncing along on a dry road in a continuous column of dust through which the edges of the green fields and woods could only be dimly discerned, and imagine that spectacle, not only for five minutes at a spell, but practically without pause for three consecutive days, and it would seem incredible that any carburettor could come through such a drilling. Moreover, it will readily be conceived that driving at full speed under such conditions frequently necessitated the jamming on of brakes in emergency fashion that your wise motorist invariably guards against to the best of his ability.

Grand Duke Cyril of Russia in Forstenrieder Park.

Max Hesselberger driving his Leon Bollee up the Kesselberg.

Many of the cars driven by certain drivers—happily none of the British team fell under the temptation—came on abrupt bends and right angle corners at speeds ranging from forty to sixty kilometres an hour. Yet a round dozen of vehicles so handled never experienced a tyre trouble of any sort whatever. To quote the words of "Admirable" Mr. Bush, "Is there any justice in luck?"

The first control was at Augsburg, where one had time to see the white wings of an unhappy chicken on the honeycombed cooler of the car behind, and for the first time realised how rapidly a transformation scene can be produced when motoring. Less than a couple of hours before each vehicle had appeared as bright as a new pin; now vehicle and occupants were literally plastered with dust. And the result? Well, in place of having to wait a mere hour, as per schedule, the cars had to wait over an hour and a half, and so it continued at every control throughout the day, for in Würtemberg there is a speed limit of thirty kiloms., or twenty miles an hour, hence the machine could not be written down

as having officially entered until the pre-arranged minimum time had elapsed. This meant long waits in the scorching sun, which boded no good to tyres that had had the unnecessary strains imposed on them by taking corners at great speed with more than usually heavy bodies.

As at Hereford last year, so in Bavaria this week, the competitors have had a hearty welcome and a royal reception from all and sundry. Bouquets and fruit, and little notes requesting the receivers to send post cards announcing their fortune, were cast into the cars, and it illustrates how closely the vehicles were scanned as they passed along to record the fact that those tokens received by Mrs. Manville, in nine cases out of ten, were addressed to the "Only Lady Driver." Unhappily from the point of view of educating all classes of the public to regard the horseless carriages in a favourable light—which must be one of the chief purposes served by all reliability runs—a great number of machines ran with open exhaust boxes. Wherever the cars went it was holiday time for all manner of folk from school children of six summers to factory hands and farm labourers of sixty years and upwards. Moreover, the little ones were scattered in any manner in which they chose to group themselves, but were attended by their teachers, who one could see drawing their attention to feature after feature as the cars passed in review. One had experience of how wearisome it must be to wear a crown, for it was a case of returning courteous salutes hour after hour. It was noticeable, too, what a vast number of men who had passed the prime of life by more than a decade honoured the occasion by wearing medals they had won in war or other tokens of lives spent in rendering service to their country.

At Baden-Baden that evening there

were fêtes in honour of the competitors, who were mostly too tired to be present, but whose tongues went on wagging during hours when they would have been better employed in dedicating themselves to Morpheus. At dinner the German competitors, composing the bulk of those entered, could not refrain from talking about the English Daimlers, which had given them such a scare at Kesselberg, and in the speed trials. They were perfectly frank in expressing their relief that such a fortuitous circumstance as punctures had that day robbed Mrs. Manville, Mr. Edward Manville, Mr. Frank Rendle, and Mr. W. Herdman Ash of their chances of securing the trophy, but be it recorded to their credit no words of praise seemed too generous to bestow upon the cars themselves, which they said were "vunderbosch." Herr Max R. Zechlin, of Charlottenburg, said that he was familiar with all cars, but that he had never been in one so simple as these Coventry-built machines that ran like clocks, adding that he had been waiting for

over six months before advising a friend in China what make of touring car he should have, and that he himself would pay a visit during the month to the works at Coventry, and secure one of the machines for his friend. Prinz Franz Joseph, of Battenberg, has also determined on securing a Daimler.

Scarcely had the cars set out from Baden-Baden on Tuesday than the only mishap to the public that occurred during the tour, as we recorded last week, befell at Herrenalb, where two children were inadvertently knocked down by a competing car that was proceeding in the customary cloud of dust; but happily the result was not fatal as was at first reported. The steepest rises and most difficult course from the point of view of hair-pin corners were encountered as the renowned watering-place was left behind. Nothing more picturesque could

A group of spectators on the Kesselberg. Professor Herkomer will be noticed bareheaded in the centre of the picture.

be conceived than the scene of the long series of cars when wending their way up the beautifully-graded hills while the land was yet covered in the early morning mists that give an equivalent effect that a blue bloom had on fresh-plucked fruit. Then the crest having been reached, the cars ran downward as the sun's golden rays pierced the lanky tree trunks which lined the beautiful valley. There was one bad *pavé* during this stage, and then came greater hills billowing the one beyond the other and forming the steepest climb of the series mapped out. The negotiation of the somewhat awkward bends and corners was rendered the more difficult from the driving point of view by having to dart through sections of road shot with sunlight, then plunge into the shady portions for spells, Stuttgart with its unrivalled gardens being the first stage, and Aalen the second. There was an interesting little scene at the first-named place, when Werner (of Gordon-Bennett fame) met his aged mother and father, the little group being photographed beside Mr. Clarence Gray Dinsmore's big Mercedes. When one glanced at the aged couple one could not but wonder why Werner was not even better-looking than he is, for a handsomer man than his clean-shaven father, a pleasanter-visaged woman than his mother, are rarely encountered among the peasant class. Here the "receiving officers," as the marshals were nicknamed by some of the mechaniciens, were especially impressive, for some of their number appeared in gorgeous Prussian blue plush knickerbocker suits. By the irony of fate, at Aalen, a particularly German band "obliged" outside the Wagner Hotel. It was at this period that the news of the morning's mishap became officially known, with the result that the re-starting was delayed half an hour while a discussion took place as to the possible means of reducing the likelihood of such

The special stand of the members of the Royal Bavarian House in the Forstenrieder Park.

untoward events to a minimum, especially as Bavaria of the no-speed-limits was to be reached in the neighbourhood of Rothenburg. It was decided that any car overtaking a vehicle running at thirty kiloms. an hour should be disqualified forthwith. It can not be recorded, however, that the announcement made any striking difference to the tactics observable. In the heat of the day observers, unaccustomed to duties in the early hours of the morning, could not refrain from taking forty winks while the cars sped over the rolling agricultural country, where all the farm labourers had abandoned their tasks to appear in their "Sunday bests" in our honour along a road that was more than commonly well patrolled and petroled.

By some as yet unexplained re-arrangement of plans, there was no waiting at Rothenburg, which is supposed to be the scene of "Faust," a fact the more to be regretted in that the town is one of the three most ancient and picturesque comprised in the itinerary. The remainder of the day's run to Nürnberg was practically a sprint on the flat in the sunshine, the mediæval city being reached about 5 o'clock that afternoon. Here a busy and not easily to be forgotten evening was spent in sightseeing and meeting friends.

Despite his troubles during the day, Mr. Frank Rendle kept everybody within range in a roar of laughter during the dinner, recounting how, when his tyre troubles came again, he had to struggle with what seemed to be a small crowd of 500 persons in view of securing a puff or two of air for pumping-up purposes.

As the "Admirable" Albert Bush—who was then lying on his back at the time—remarked, at the conclusion of the story, "I guess if anybody knew English there, they'll think we were a bit

flowery." For a few glorious moments that day Mr. Edward Manville was leading the chase for the trophy, when—"punkt!" and that chance went with the air that escaped from the tyre.

On setting out from the picturesque old town, with walls reminiscent of the great one in China, and reaching the open country, it was a case of people—people every-

where, and always dust to gulp. The road lay through an open country, where the bends were fewer and less severe than ever before, across the Donau, with its waters of seaweed green, and so into Regensburg, another Rothenburg, and likewise a prearranged halting place, where the early arrivals were sent on ahead without the hour's halt that might have enabled one to explore the

HERKOMER TROPHY.

chief features of rare interest. The Bavarian blue and white flag was to be seen along the road of the last 131 kiloms. back to Munich, among those turning out to offer a hearty welcome being several groups of novitiates from monasteries on the abutting line of the route.

As the party got within 30 kiloms. of the finish of a 660 and odd miles tour, that had been completed without a drop of rain, leaden clouds hung over Munich, and the last car to arrive had scarcely come to a halt than the downpour began; happily, however, it did not last the proverbial fortnight, and everybody was in the best of spirits, for had not Professor Herkomer greeted them as they passed through Freising, "viel gluck"-ing them each in turn, and hoping that the event would prove the trophy to be theirs. As the "Admirable" Bush remarked afterwards, "I reckon he was taking a preliminary peep for our portraits." The finest reception accorded any individual competitor fell to the lot of Mrs. Manville, who on driving her machine to the finishing line was presented by the Bavarian Automobile Club with a great laurel wreath, some four and a half feet in diameter, with the Bavarian blue and white streamers. Mrs. Manville was specially invited to the banquet on Thursday night, and had a round half dozen of royal personages introduced to her.

Concerning the results, it may be briefly recorded that the trophy goes to Mr. Edgar Ladenburg, of Munich, for the performance of his 40-h.p. Mercedes, which had only 25 marks against it, the other places being secured by the following in order named, the marks in brackets indicating the marks against them: Hermann Wiengand, of Düsseldorf (27), 40-h.p. Mercedes; Willy Pöge, of Chemnitz (28), 60-h.p. Mercedes; Friedrich Küsel (29), 40-h.p. Benz; Fritz Opel (30), 35-h.p. Opel; Fritz Werner (30 and fraction), 30-h.p. Mercedes; B. Flinch (30 and fraction), 40-h.p. Mercedes, driver Herr Wild; J. Turck (31), 40-h.p. Benz; Alfred Tewes (31 and fraction), 24-h.p. Adler; Carl Lühr (33), 24-h.p. Adler; B. Flinch (34), 40-h.p. Mercedes; E. Scharrer (37), 40-h.p. Benz; Joseph Göss (38 and fraction), 24-h.p. Adler; and A. Baur (38 and fraction), 24-h.p. Clement; no fewer than 10 cars tying for 16th place, including Mr. Philip Dawson with his 35-h.p. Daimler, a highly creditable performance, as it is the first competition of any sort in which he has figured. Mrs. Manville, Mr. Edward Manville, Mr. Frank Rendle (driver Mr. Albert Bush), and Mr. W. Herdman Ash, each received a bronze plaque for coming through the competition. They have only suffered from tyre troubles, their machines never having caused a moment's anxiety, and it says much for British workmanship to record that Mr. Ash is one of those who only took to motoring in March last.

Of 79 starters, 69 came through, and 34 of the latter without troubles of any sort. At Thursday night's banquet, Doctor Freiherr von Schrenck-Notsing, president of the Bavarian Automobile Club, announced that next year tyre troubles would not count in the marking, as it had been recognised that some of the best cars had lost places because of them. Dr. Levin Stoelpling, of the German Automobile Club, made special reference to the good sportsmanship during the competition, and spoke highly of the Britishers who had brought five cars so long a distance, and stated that no other team's performance had surpassed that of the Coventry-built Daimlers, whose speed, simplicity, and regular running had been the subject of general remark and admiration.

Moreover, in a speech that was made in English with the special object of conveying the opinions of the officers of the Bavarian Automobile Club concerning the British performances, it was expressly stated that regrets were felt that tyre troubles had been allowed to count, it being deemed that a very different story in regard to results would have been unfolded had no marks been deducted for an accessory which had no part in a motor car proper. In conclusion, it may be stated that Professor Herkomer designed a magnificent menu card in colours, the original of which was presented to Prince Ludwig, but unhappily the work had not been completed in time for its reproduction in *facsimile*. The subject represents fate flying in front of a motor car, which has been obviously drawn from the Professor's own Daimler. We are promised copies in due course, hence we hope to be able, during the next few weeks, to reproduce so interesting and unique a souvenir of a most interesting competition.

The representatives of the Automobile Club at the meeting wish to acknowledge the courtesy of Herr Bernhardt Flinch, of Frankfurt, for his kindness in offering a seat on his 40-h.p. Mercedes, driven by Herr Wild; that of Monsieur Ernst Cuénod, of Paris, for a seat on his 40-h.p. Martini; and also of Mr. Edward Manville for a seat on his 35-h.p. Daimler.

THE chief official results of the Speed Trials, held on the Kesselberg Hill, and on the flat in Fürstenrieder Park, are given in tabular form below:—

RESULTS.

Place.	Machine and Entrant.	Kesselberg.	Fürstenrieder.	"Marks."
CLASS I.—60-100-h.p. (3 competitors).				
1	h.p. 60 Mercedes (W. Pöge) ...	m. s. 6 37½	m. s. 4 12½	m. s. 17 27½
2	70 Mercedes (C. G. Dinsmore) ...	7 29	5 0½	19 58½
3	60 Mercedes (W. Tischbein) ...	7 39	4 43½	20 1½
CLASS II.—32-60-h.p. (44 competitors).				
1	35 Daimler (E. Manville)...	8 11½	4 10½	20 33½
2	35 Daimler (F. Rendle) ...	8 15½	4 18½	20 49½
3	50 Hermes (G. Langden) ...	7 53½	5 10½	20 57½
4	35 Daimler (Mrs. Manville) ...	8 30½	4 9½	21 10½
5	40 Mercedes (E. Ladenburg) ...	7 59½	5 19½	21 18½
6	40 Mercedes (H. Weingaud) ...	8 11½	5 11½	21 24½
CLASS III.—16-32-h.p. (44 competitors).				
1	20 Martini (Martini and Co.) ...	8 15½	4 25½	20 57
2	24 Adler (Adler Co.) ...	8 58½	5 1½	22 59½
3	30 Martini (E. Cuénod) ...	9 19½	4 54	23 33½
4	24 Adler (W. Vogel) ...	9 22½	5 12½	23 57
5	24 Adler (J. Göss)...	9 24½	5 11½	24 1
6	24 Adler (v. Lüde) ...	9 42½	5 10½	24 35½
CLASS IV.—Up to 16-h.p. (8 competitors).				
1	15 Opel (B. Branda) ...	9 46	5 35½	25 7½
2	12 Metallurgique (Sudd Co.) ...	11 15	5 20½	27 50½
3	12 Beckmann (A. Jaensch) ...	12 16½	5 32½	30 4½
MOTOR CYCLES.—Up to 3½-h.p. (29 competitors).				
1	Adler (P. Karrer) ...	7 7½	4 57½	12 4½
2	Puch (J. Vecka) ...	7 15½	4 56½	12 12
3	Brennabor (W. Wolff) ...	7 39½	5 14½	12 54½
4	Neckarsulm (Frau Eisenmann) ...	7 50½	5 11½	13 1½
5	Adler (W. Finke) ...	8 49½	4 16½	13 6½
6	Wanderer (H. Meyer) ...	7 34	5 33½	13 7½
Over 3½-h.p. (12 competitors).				
1	Puch (E. Obruba) ...	6 22½	3 57½	10 19½
2	Mars (G. Retienne) ...	6 19½	4 15½	10 35½
3	Neckarsulm (M. Geiger) ...	6 59½	4 51½	11 51

The "marks" column contains the aggregate of the time on the level, plus *twice* (except for the motor cycles) the time on the hill, thus, although both events are combined for the classification of these two events, there is, nevertheless, a premium on good hill-climbing compared with pure speed. In our last issue we gave the formula on which these marks were to be allotted and this has of course been adhered to. Instead of expressing the marks in the form of fractions (*e.g.*, for example, $17\frac{2}{3}$), the aggregate times on which they are based have for convenience been left in their original form as minutes and

seconds; it will be understood, however, that "marks" have no actual significance by themselves as real times, but merely serve as "marks," for final classification for the entire event.

For the photographs of the controls, *en route*, at the Kochel See, and of Munich, we are indebted to Mr. Edward Manville. The other pictures of the racing, &c., are by the *Allgemeine Automobil Zeitung* of Munich.

HERKOMER TROPHY.—The British Team of Daimlers "en route" to Munich. A halt for breakfast on the "Blue Alsatian Mountains," the highest point between London and their destination. The cars during the journey climbed grades of 1 in 5 for 5 kilometres.

Returning Good for Evil.—A policeman rescued by motorists should surely be a spectacle to make the angels weep or the gods smile (whichever simile may be preferred). Such a portent, however, occurred recently on the Hog's Back, near Guildford, where a police sergeant was in considerable difficulty among a mob of gipsies, one of whose number he was attempting to arrest. The officer of the law was in a bad way, when two gentlemen passing in an automobile jumped down and enabled him to secure his prisoner, who, with the policeman they then conveyed to the next police station. Should, on some future occasion, this police sergeant be in any doubt as to whether some particular automobilist, on a measured stretch of road, is exceeding the speed-limit or not, we trust gratitude will prompt him to give his potential victim the benefit of such doubt.

A VERY unpleasant accident occurred on Monday to some of the horses of the Warwickshire hunt, of which Lord Willoughby de Broke, who is the leading spirit of the anti-motorist "Highways Protection League," is master. A car being driven by an American, named Barnard, ran away down Edge Hill and dashed into the horses, some of whom were injured, one having his leg broken. The car itself was smashed to pieces.

APROPOS of Lord Willoughby de Broke (it is his real title and was not invented by Dickens), the Highways Protection League, of which he is one of the vice-presidents, is on the warpath with a view to future

automobile legislation. This body, which includes Sir Walter Gilbey, the Master of Emanuel College, Cambridge, and Mr. Cathcart Wason, M.P., positively proposes that the speed of motor cars should be reduced to 14 or 15 miles an hour, and that local authorities should have the power, without being worried by having to apply to the Local Government Board, to fix a lower speed in towns and in villages, or anywhere else that may seem good in their eyes, at any pace they like. One can imagine what that would result in. Needless to say it would mean the extinction of the automobile movement. When the automobilist, after traversing 10 miles through the parish of Muddysludge, where the speed limit is fixed at 5 miles an hour, has to take a tour of another 5 miles through the township of Stoppemall Brokeby, where 1 mile an hour has been fixed by the District Council as the speed limit, before getting home, he will soon tire of the automobile. And that is what we should very soon see.

Even this, however, is not enough for the Highways Protection League. They desire, amongst many other little restrictions, to make "*driving so as to cause serious annoyance or discomfort to other persons a serious offence*," and to have the registers of motor cars thrown open to public inspection! Who is to be the judge of "discomfort?" A gouty old professor or master of a college seated on Leith Hill, and seeing a motor car traversing the valley of the Adur, might regard the car as being driven to his discomfort—it might run against his greatly magnified toe!—while the throwing open of the registers to the public would be hailed with acclamation by the noble and ancient army of blackmailers!

THE 40-50-H.P. RICHARD-BRASIER CAR.—PART I.

Fig. 1.—The 40-50-h.p. Richard-Brasier Chassis, as seen from the "off" side.

HITHERTO, all the latest standard types of touring car built by the Richard-Brasier firm have been of the "live-axle" form of construction, and this remark applies to all the three 1905 models, which are already well known in this country. Now, however, advantage has been taken of the phenomenal success scored by Théry in the Gordon-Bennett Race—both this year and last year—and the firm are producing an extremely powerful touring model which precisely follows the same general lines as their famous racers. The first chassis of this type arrived from France quite recently, and was on view at the show rooms of the English agents—Messrs. Mann and Overton—at the time that our photographs were taken. Others are expected to arrive shortly, and quite a number of these exceedingly well-designed cars are likely to be seen on our roads ere long.

This chassis, of which an excellent idea can be obtained from Figs. 1, 2, and 3 (views from the "off-side," from above, and from the front, respectively), is of the chain-driven pattern, and weighs about 20 cwt. It has, as can be seen, a particularly neat and simple appearance, while,

from the external dimensions of the engine, and the space that it occupies, a very inadequate idea is conveyed of the power that is in reality available. Although nominally of 40 to 50-h.p., we learn that the engine is actually capable of developing about 70-b.h.p. at 1,500 revs. per min.

Distinctive Features.

All the special features of the firm's celebrated racing cars have been embodied in the design, and, otherwise, the details of construction differ little, if at all, from those of these maker's touring vehicles. Thus we find quite a number of unusual characteristics which differentiate it from those of similar power built by other constructors:—The pressed-steel frame has two short inner members for carrying the engine. Between the frame and the axles are fitted "Truffault" anti-shock devices for protecting all four springs from too sudden action on exceptionally bad roads. A special device is employed for rendering the engine easy to start, by not only raising the exhaust-valves during the early part of the com-

Fig. 2.—View of the 40-50-h.p. Richard-Brasier Chassis from above.

pression strokes, but also by simultaneously "retarding" the ignition. A single lever control is adopted for regulating the engine. No provision is made for "timing" the ignition under ordinary running conditions. Lubrication for the engine is rendered positive and automatic. There is no fan of any kind for drawing air through the pump-fed radiator. The main clutch, which is of the leather-faced cone type, is prevented from slipping, when fully engaged, by a set of pins which then lock its two members firmly together. The shaft transmitting the power from the clutch to the change-speed-gear has unusually large, oil-retaining, universal joints at both ends. The gear-box which provides four forward speeds and a "reverse," is secured to the frame in a special manner, and other noticeable features about it are that its shafts run in ring-lubricated bearings, and that the differential gear lies outside, instead of inside it. The gear-box partly "floats" on the countershaft, the ends of which have large ball-bearings, and, in addition to the usual radius-rods for adjusting the twin-roller side-chains, there are other radius rods for taking the "torque" of the powerful, internal, expanding hub-brakes.

Chief Dimensions.

With its straight main frame, the chassis is suitable for taking any desired form of touring body, and its length is ample to allow for wide side-entrances to the rear seats. The wheel-base is 9 ft. 6 ins., and the track is 4 ft. 7 ins. On the front wheels, 910 by 90 mm. tyres are fitted, while the tyres on the driving wheels are 920 by 120 mm. The cylinders have a bore of 125 mm. with a stroke of 130 mm., and the car is usually so geared that on the fourth speed it can attain a speed of 65 miles per hour, when the engine is running at about 1,200 revs. per min.

The Main Frame.

The side members of the frame are quite straight, as seen from above, but have a tapering C-section, and are curved down in front to form the projecting spring-horns. Rigidity is obtained by means of gusset-plates at the corners, where the cross-members meet the side-members—as seen in Fig. 1—and in Fig. 3, is clearly shown the unusual shape of the front member, which is U-shaped to accommodate the radiator and the starting handle. This front member also serves to support the underframe, upon which rests the engine, the other end of the underframe being connected to the main frame beneath the dashboard.

All four springs lie immediately beneath the side members, and the "Truffault" devices lie close beside them—those at the rear being just inside them, while those in front are outside them. Both axles are formed by very substantial forgings, the shapes of which are well shown in Figs. 2 and 3; in the latter illustration an excellent idea is obtainable of the steering-heads also. All the road wheels have ball bearings, as also have the steering-heads; and the steering-gear is of much the usual worm-and-segment type, completely protected inside a dust-proof casing, and provided with all necessary adjustments for taking up any wear.

Securely fixed to the two side-members are the large ball-bearings that carry the ends of the differential counter-shaft; the same fittings that contain the ball-races have the chain-adjusting radius-rods hinged to them. The other fixings for the gear-box, which is unusually small in consequence of the external arrange-

ment of the differential-gear, are also visible in Fig. 2. At its front end, the upper portion is secured centrally to one of the intermediate cross-members, and at the other end there is a central link-attachment connecting both the upper and the lower portions of the box to the other cross-member of the frame.

Fixed transversely, quite at the rear, is the exhaust-box, to which two exhaust-pipes lead the gases from the four cylinders. From the engine itself there are four separate pipes, but these are united in pairs with the two long pipes. The

side-levers, the pedals, and the brake-gear are neatly arranged with cross-tubes spanning from side to side of the frame, and there is an unobtrusive dust-proof sheathing that lies beneath the engine and the main-clutch.

The Brakes.

Taking the brakes into consideration next, since they, also, are visible in the same illustrations, a very noteworthy characteristic is the provision that is made for taking the "torque" of the brake-shoes. In the case of the hub-brakes, which have toggle-operated internal shoes, the two shoes are hinged to the special radius-rod that anchor them direct to the frame. Not only are these radius-rods adjustable as to length—like the ordinary radius-rods—but two other adjustments are available, one in the operating rods and the other in the toggle-links themselves. These brake-shoes, which are made of hard phosphor bronze, are of large diameter and have a wide friction face.

Fig. 3.—Front view of the 40-50-h.p. Richard-Brasier Chassis.

The foot-operated brake on the countershaft has its contracting shoes anchored by a rod to the rear member of the frame, besides being fixed to the intermediate cross-member, as seen in Fig. 2. Any abnormal strain is thus well distributed, instead of merely being concentrated on a single member. The brake-drum is secured to the shell of the differential, and a very direct connection is established—with the necessary adjustments—between the toggle-mechanism and the foot-pedal, which is of the "push" pattern. Neither the foot nor the hand brake is inter-connected with the clutch. In Fig. 1 is seen the "sprag," lying as it does immediately beneath the side of the frame, on the "off" side.

The Change-Speed-Gear.

Fig. 2 gives a very good idea of the external appearance of the gear-box, the method of fixing which has been referred to already. It is made in two parts, and has two inspection covers, in the upper portion, both of which have been removed in our view. The "through" shaft carries the sliding spur-wheels on a squared portion, and the "direct-through" drive—giving the top gear—is obtained by a jaw-clutch. Unusual features are the long, ring-lubricated plain bearings for all three shafts—the "through" shaft, the lay shaft, and the transverse

countershaft—the absence of the differential-gear from the interior of the box, and the method of operating the mechanism without interfering with the oil-tight character of the casing. This last-mentioned provision is made by a short rock-shaft that passes through the side of the box and carries small pinions on each end. The outer pinion is in engagement with a toothed quadrant, and the inner pinion meshes with teeth on a sliding rack. The quadrant is in turn coupled up with the hand-lever, and the sliding rack carries the fork that controls the sliding spur-wheels. In Figs. 1 and 2, the light casing partly surrounding the quadrant and its pinion can be seen.

Two other "points" about the gear mechanism are deserving of attention. One is that the rear bearings for the "through" shaft and for the "lay" shaft are arranged *in front* of the constantly-meshing spur-wheels, through which the power is transmitted from the lay-shaft when either of the lower "speeds" are in play. And the other is that the neutral notch, on the quadrant for the hand-lever, is placed between those for the first and the second speeds, instead of between the first speed notch and the "reverse" notch. Four forward-speeds, in all, are available.

(To be continued.)

National Automobile Society.—Under this title another combination of automobile users has been founded, with the following list of vice-presidents:—Lord Armstrong, Sir W. Martin Conway, Captain B. D. Corbet, Mr. Spencer Chadwick, Baron De Lehmann, Sir Humphrey F. De Trafford, Bart., Sir Michael Foster, Sir Douglas Fox, Col. W. Hudson Hand, Sir William Thomas Lewis, Bart., Sir Kenneth J. Matheson, Bart., The Rt. Hon. Sir F. G. Milner, Bart., Capt. D. Hughes Morgan, Sir Gilbert Parker, Col. Edward Pryce-Jones, General Sir Julius A. R. Raines, Sir Edward L. Samuel, Bart., Sir Henry Seton-Karr, Sir Herbert Stephen, Bart., Sir James L. Walker, Sir Allen Young. The scope of the society is very wide. The objects are set forth in the prospectus issued by the society, from which we extract the following leading paragraphs:—

The society has been founded to represent, protect, and further the interests of the general body of motorists who use their cars for pleasure and touring, as distinct from purely trade and speed purposes.

The contention that the mechanically propelled vehicle, when properly handled, is a safeguard rather than a danger, as compared with the horse-drawn conveyance, is generally ridiculed, and in face of the numerous accidents and fatalities brought about by reckless driving and violations of the ordinary etiquette of the road, it is hardly to be wondered at that the prevailing opinion very largely obtains. In effect, the whole motoring community is suffering for the short sighted policy adopted by a small reckless minority represented almost entirely by irresponsible drivers and agents of makers, who seek advertisement for their cars at any cost.

The outcry against the racing car and reckless driver, and the general prejudice of the public, has now reached such a stage that popular opinion is apt to place all automobilists on the same footing, whereas the majority of car owners and users are more strongly than any member of the public opposed to the excesses of the few, inasmuch as the campaign of official terrorism and oppression that is now growing day by day, bears more than harshly upon those who have the true interests of the motor car and its future at heart. The closing of Hyde Park and other restrictive measures, and the recently introduced Amendment Act, are directly traceable to malpractices such as exist on the part of the small minority, but the effects of which react most upon innocent users of the highways.

The speed car as a racing instrument pure and simple is well-nigh impossible, and entirely out of place in this country except on a

proper track, and the development of the motor car on the lines of mere power and speed can do little if any good to its larger prospects. The society will strenuously set its face against such misuse of the public roads, and by an energetic and uncompromising opposition to such excesses, will be in a position to insist upon a proper consideration being given to the rights of its members, who have hitherto suffered by reason of an apparent or assumed acquiescence in law-breaking practices to which they are in reality entirely antagonistic.

It is not intended to formulate a number of extravagant agitations, as is now done in some quarters, but to proceed on unobtrusive and constitutional lines to secure an amelioration of the present restrictions, which are so unjust to an so unnecessarily detract from the enjoyment of that large section of the public that asks for nothing more than a fair and reasonable right to use the public ways in conjunction with others.

More particularly will the society's attention be devoted to the abolition of the present speed limit, which has entirely failed in its object and possesses no compensating advantages, and to the revision of the present exorbitant fines imposed for trifling offences, which serve no practical purpose whatsoever. The approaching General Election also presents an excellent opportunity for the election of representatives to Parliament, who are either themselves motorists or are pledged to support and further the work of the society, and a systematic canvass of the candidates will be made to ascertain their views, so that the votes of the society's members may as far as possible be directed to secure the return of those whose interests and sympathies are identical to their own.

In addition, the society will be developed in many other directions, of which the following may be mentioned:—

To establish and appoint in the different centres, official representatives, whose services will be at the disposal of members.

To arrange with leading hotels and garages throughout the country to give special facilities and terms to members of the society.

To advise members as to their rights and obligations, in connection with which the services of the official legal advisers will be available on their behalf.

To organise and conduct trials of cars and automobile inventions, and especially to test methods of alleviating the dust nuisance and to encourage municipal authorities to devote special attention to improved road-making in the interests of the general public.

To secure the revision and amendment of the restrictions at present in force in the parks and elsewhere, and to obtain for automobiles the same rights and privileges as are granted to other forms of traffic without question.

To publish for circulation among members an official journal dealing with the latest phases of the automobile world from the society's standpoint.

SPRING WHEELS FOR MOTOR CARS.

(Continued from p. 1019.)

THE HALLÉ SPRING WHEEL.—II.

TURNING now to the construction of the wheel itself, this may be divided into three main parts, viz., the wheel proper, the hub members, and the interconnecting members between the wheel proper and the hub members. The wheel proper consists of a tyre, A, with its rim, A¹, the latter being attached by spokes to the outer nave, A³, which is of T-section. As thus constructed, the wheel proper is in every respect an ordinary wheel in itself, and could be used as such around any hub designed to suit it. The principal hub member is the hub proper, B (engaging with the axle in the usual way) which is provided with a collar, B¹, about the centre of its length. Riding on either end of the hub, are two flanged sleeves, B², which are made as light as possible in accordance with the strength required. Semi-spherically headed bolts or links, C, pass through holes in the flanges, B², and

form of wheel, are carried from four radial arms that are attached to the collar, B¹, on the hub. Originally, these supplementary springs were of the single leaf type and were carried, as shown in Figs. 1 and 2, by shackles, E¹, attached to radial arms; in Fig. 4, however, they are of the volute type, and are attached direct to the radial arms themselves, which pass through slots in the outer nave, A³, that forms the seat of reaction for the springs, as shown in the illustrations.

The differences in detail which exist between the two early types of wheel and its present form are illustrated in Fig. 5, which gives a section and elevation of the central part of the new wheel. It is, as has already been pointed out, entirely in connection with the supplementary springs that the changes in design have been made. Instead of four volute springs, E, there are now, it will be noticed, no less than sixteen, but as these are arranged in pairs there are, in effect, only twice as many points of support as before. These springs, E, are now no longer carried on radial arms fixed to the flange, B¹, of the hub, B. Instead they are mounted on plates, E³, by means of bolts, E², which pass through, and tighten up against, the outer nave, A³. The plates, E³, are thus capable of being drawn up as tightly as may be desired against the outer nave, and in this way they form the means of supporting a set of eight radial plungers, E⁴, the outer flattened heads of which are interposed between the plate, E³, and the outer nave, A³. These plungers, E⁴, are carried in tubular guides, E⁵, which are fixed to the outer nave, A³, and virtually form part of it.

In other respects the construction of this latest model does not differ from those preceding it, except that a loose steel ring, B³, is fitted over the collar, B¹, on the hub, for the purpose of forming a suitable abutment for the inner ends of the plungers.

The difference in principle of action which has been introduced into this latest model will be evident on comparing the arrangement of the supplementary springs, E, as shown in Fig. 2, and as illustrated in Fig. 5. In the former case, the inner hub was permanently connected to all the supplementary springs, whereas now it is not connected to any of them, but merely rests on as many as may be in a suitable position to support it. In the early form of wheel there was nothing to be gained by tightening up the springs—although with the type illustrated in Fig. 4 this could be done if necessary. Now, however, the springs are independent of the hub, and in tightening them up they may be made to resist its weight without deflecting. The advantage of this system remains to be demonstrated. Hitherto, in spring wheels, the hub has been allowed to float on the springs, and although this method must inevitably cause normal eccentricity between the hub and the rim, yet such a wheel would appear to be more elastic than one in which the springs are only susceptible to small external forces which act in an approximately vertical direction, and in which the "recovery" after a shock is entirely "undamped"—owing to the upper auxiliary springs forming a "dead stop" against all possibility of reversed eccentricity.

It will be noticed that any relative rotary motion between the hub members and the outer nave will also cause obliquity of the links, C, and a consequent

Fig. 4.—The Hallé Spring Wheel. View of another early type of Hallé Wheel, fitted with Volute Supplementary Springs, E, instead of the Single-Leaf Springs shown in Figs. 1 and 2. Pressed Steel instead of Wire Spokes are another feature of this model.

loosely connect those members with the outer nave, A³, the bolts passing through corresponding holes in the web of this T-section nave. There are eight links or bolts in each wheel—four to each flange—spaced off equally round the central nave; the nuts as well as the bolt heads are hemispherical, so as to give as little resistance as possible to the oblique movements of the links when the wheel is in action. The main spring, or rather springs, D—for it is in two parts—is of the helical type, and has a square section. Both halves of the spring surrounds the hub, one part being on either side of the fixed collar, B¹, between which and the flanges of the sleeves, B², they exert their pressure. These springs are, of course, given a certain amount of initial compression, the effect of varying which has already been dealt with in the abstract. The supplementary springs, E, as used in the earliest

Fig. 5.—The latest form of Hallé Spring Wheel showing the arrangement of the self-contained volute springs and the plungers by which they support the axle. Only the central portion of the wheel is here illustrated.

compression of the springs, D, which will thus oppose such motion. The drive, which is transmitted to the hub member, and through the links, C, to the wheel proper, is, therefore, also affected by the presence of the springs, D, which thus tend to damp out any fierceness of the clutch on the car, and to a certain extent compensate for the effect of any sudden inequalities in the torque. The advantages of a "spring drive" have been emphasised by us before and it is a distinct advantage if any spring wheel provides, without additional complication, this desirable feature, more especially if, in so doing, the springs are still stressed in the normal manner and are only subjected to such stresses as they are suited to withstand.

Table of Reference Letters for the Hallé Spring Wheel.

A Tyre.	C Links.
A ¹ Rim.	D Helical main springs.
A ² Spokes.	E Supplementary springs.
A ³ Outer nave.	E ¹ Shackles for E.
B Inner hub.	E ² Bolts for E.
B ¹ Collar on hub.	E ³ Plates supporting E.
B ² Flanged sleeve on hub.	E ⁴ Plungers.
B ³ Loose ring over R ¹ .	E ⁵ Guides for E ⁴ .

THE Post Office has decided to establish a motor van service to convey mails and parcels by road between Glasgow and Edinburgh.

MANY excursionists from Lancashire, Yorkshire and other manufacturing towns in the North of England who used to go for their annual excursions to Blackpool by rail, have now abandoned that prosaic method of locomotion, and regularly take their annual outing (and wash) in motor coaches. "Full of undreamed of delights," is how they are said to describe such an outing by the local penny-a-liners, though we believe the motor-car beanfeasters spell it quite differently.

A PRETTY bad example of senseless police persecution has been provided by the Bedfordshire police. Experiments were being conducted by a London motor syndicate in regard to methods for preventing cars from raising dust. The runs took place down an unfrequented hill, and the whole thing was done for the purpose of obtaining data for alleviating what is admittedly a public nuisance. The police prosecuted, however, and obtained a conviction before the Woburn Bench, though there was not the slightest evidence of anyone being endangered or even inconvenienced.

MR. FRED PAYNE, of the Three Tuns, Maidstone, was on Monday set upon by a whole gang of Hooligans suffering from a combined attack of alcoholism and anti-mobile-monomania in the neighbourhood of Snodland. As similar incidents had occurred in the case of ordinary cyclists on the same road, Mr. Payne had supplied himself with a revolver, and had to use it to the extent of

wounding one of his assailants in the hand before he could get free from them.

MR. GEORGE HOLLOWAY, of Hereford, was recently arraigned before the Bench of that town for

"That whilst driving a motor car on the highway at Dormington he did not while passing certain cattle proceeding in the same direction, keep the motor car on the right or off side of the road."

After a lengthy hearing the case was ultimately dismissed. From the evidence it would appear that Mr. Holloway did his best to get past the cattle with the minimum of unpleasantness and that the summons was wholly unjustified. He complains to us that the clause in the regulation for motor traffic, under which the summons was taken, was never intended to be read literally in all cases, and states that this matter will be brought before the Royal Commission with the object of "having this absurd regulation altered"—a most commendable decision. The case is described in a local paper as of great interest to motorists and the farming community. So we would point out that Mr. Holloway might very well have countered by issuing a cross-summons against Mr. Davies who summoned him. Under the Highway Act of 1835 (5 and 6 Guelielmi 4 Cap. 50).

"If the driver of any wagon, cart, or other carriage whatsoever or of any horses, mules, or other beast of draught or burden . . . shall not keep his wagon, cart, or carriage or horses, mules or other beasts of burden on the left or near side of the road, every person so offending shall . . . forfeit any sum not exceeding £5."

We suggest, therefore, that the law of the land was on Mr. Holloway's side, and that while being acquitted himself, he should have been able to procure the punishment of Mr. Davies.

We accordingly agree with the local paper that the case is of "great interest to motorists and the farming community."

CORRESPONDENCE.

*. * The name and address of the writer (not necessarily for publication) MUST in all cases accompany letters intended for insertion, or containing queries.

RACING AND PROGRESS.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—In view of the fact that it has been decided by the Automobile Club in this country to discontinue competing for the Gordon-Bennett Race, which decision has, I think, in many cases met with the greatest possible favour, I think it just as well that it should be clearly understood that racing has been of enormous experience to the motor car builder in finding out rapidly points of design and construction that have been of the greatest benefit to the motor car user.

A small example of this advantage which really can be shown to apply to almost any part of the motor vehicle from year to year, is to take merely wire wheels which have this year been fitted to my 6-cylinder Napier racing car.

The present system of wood wheel building which has been almost universally used, has always appeared to me one of the most uncertain points in a motor car, as wood varies so tremendously with various climatic conditions; therefore, it has been under most careful consideration for some time what sort of wheel could take the place of the present almost universal wooden wheel, and after very serious consideration Mr. Napier and I determined to try the experiment of wire wheels, and for this purpose we approached Messrs. Rudge-Whitworth, Limited, whom we knew had great experience in this direction, and, in addition to cycle wheels, have had great experience in building all kinds and variety of wire wheels for Indian and African rickshas and trotting sulkies, and for some years have made all the most successful wire wheels for touring motors, notably all those for the Lanchester Engine Company.

They set to work to manufacture the finest wheels within their power to make for the purpose for which they were intended, as they realised that to supply ordinary car wheels without modification would be simply to court disaster, and give the metal wheel movement a set-back which it would take years to recover.

The first thing they had to do was to ascertain the strength of the ordinary wooden wheel, and under what conditions it failed, possibly by inattention and misuse. This being done, existing wheels were tested to destruction, and a whole series of modifications and developments were similarly treated in the extensive Rudge-Whitworth Laboratories by their experts under Mr. John Pugh. Existing theories were tried and, in some cases, found wanting, and on the newly-established theories the wheels for powerful motor cars were designed, the main point desired being to produce the lightest possible wheels, at the same time keeping their strength well in excess of the strength of the axle on which they are fixed, for a collapsed wheel is a much more serious matter than a bent axle on which it is possible to get home.

The result of these experiments of Mr. Pugh's was a saving of over 40 lbs. in the weight of the four wheels with an increase in strength of over 30 per cent. over the wooden wheels, and the ability to stand variable climates incalculably better. Now these results of Messrs. Rudge-Whitworth's were only obtained at a cost of over £300, and to take this one point in the building of a modern racing car, it only shows that even where slight departures are made from current practice how necessarily expensive they are.

Another great point which has been established, as the result of this research and experimental work in wheels, has been that Messrs. Rudge-Whitworth have carried the design and production of wire wheels to a point of excellence and reliability far in advance of anything that has been done before, and have in the course of a few months spent in this experimental work, given the public an absolute security against wheel failure, which could not otherwise have been arrived at except by some years of building wheels for touring practice, whereas the present results have been obtained in actual racing in a few months.—Yours truly,

S. F. EDGE.

August 17th.

THE TOURIST TROPHY.

SIR,—Now that the lists have closed for the Tourist Trophy, so many of our friends have asked us why we are standing out, as they thought the contest would have "just suited the Duryea," that we would ask your permission to explain that, whilst our standard car would fulfil all the conditions as to weight and measurements, and whilst driving under "fuel consumption trial conditions" we could get 25 miles out of a gallon of petrol, our engine is just a shade too large for us to do so under racing conditions, so that, to have a reasonable chance of success in the contest, it would have been

necessary for us to build a special engine for the job, which engine would have differed so little from our standard in actual H.P. obtained, that it would have been useless as an addition to our patterns. Besides this, we hold that the race was intended as a contest between the regular standard touring cars in use to-day, and we learned at an early date that several firms were building "freaks" for the race which, whilst complying with the regulations, were not touring cars such as would be supplied to the public, and whilst we are quite willing to pit our cars in fair contest against any other makes of standard touring cars, we decline to meet cars of the freak order. If this race is held again, it would be well to withhold conditions until a time so near the race that whilst it would permit of minor alterations being made to bring a car within the regulations, would not permit of entirely new models being specially designed, built, and tested, with which those conditions could be circumvented.

THE DURYEA MOTOR COMPANY.

Coventry.

THE AUTO-CYCLE CLUB PERMITS.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—The announcement of the Inter-Club Team Trial under the auspices of the Motor Cycling Club has once again raised the question of the desirability of a representative governing body for motor cycling. The Auto-Cycle Club claims to be that body, and in a letter to me dated August 10th, the Secretary informed me, in my capacity of Trial Hon. Secretary of the Motor Cycling Club, that a permit was necessary for the Inter-Club Team Trial, and that if such permit were not applied for and the fee of one guinea sent by noon on 16th inst., the event would be proclaimed and "Any club taking part, as well as the members competing, would be suspended. The promoting club would also be suspended." I asked for a copy of the rules, but these were not sent me, and I now find that they have not yet been delivered to the Auto-Cycle Club by the printers. My club had already decided by a simply overwhelming majority at a special general meeting not to apply for a permit for reasons which I will state later. On 17th inst. I received a copy of a circular sent out by the Auto-Cycle Club pointing out that the Motor Cycling Club had not applied for a permit, and saying that clubs or persons competing are liable to suspension, but not that they either are, or will be, suspended according to the threat contained in the letter of 10th inst. Evidently the Auto-Cycle Club committee are getting nervous, and have reflected upon the case brought against the Automobile Club by Mr. Weigel and the damages and costs that the club had to pay!

The Auto-Cycle Club, as is well known, spent money on full-page advertisements in the motor papers, drawing attention to its social programme and its members' events, and asking for recruits. This was a perfectly legitimate, if not wise, course for an ordinary club to take, but the cost was great. It must be clear to everyone that a private club catering for private members, and running in direct competition in this respect with other clubs having precisely the same objects, cannot claim to be the ruling body, and that it cannot expect the clubs with which it is competing to enrich its coffers by capitation and permit fees, thus providing it with the sinews of war. The position is equivalent to that of two local tradesmen, one of whom demands that the other shall pay half his rent for him, as otherwise he will be unable to go on competing for the local trade. Surely motor cycling clubs will not allow the Auto-Cycle Club to assume this position, but will insist on the club either ceasing to be a competitive social organisation or dropping its present ridiculous claim to be the governing body—a claim that is obviously absurd in these days of general representative legislation, and doubly so when it is remembered that the Auto-Cycle Club is by no means the oldest or the largest motor cycling organisation.

C. W. BROWN,

August 19th.

Trials Hon. Sec., Motor Cycling Club.

In the Collier Tyre Company's advertisement last week, by a printer's error, the old address in Shaftesbury Avenue was inserted instead of that of the new premises of the firm at 127-130, Long Acre, the removal to which was made quite nine months ago. So well known have these splendid new show rooms already become, however, that we have but little fear that any serious inconvenience can accrue from the mistake, although we naturally take the first opportunity of making public the necessary correction.

RACES, RECORDS, AND TRIALS.

In front of Longfellow's Home.

Where the Russian and Japanese Peace Conference is being held at Portsmouth.

SCENES ON THE GLIDDEN TOUR.—Some of the famous American points visited.

Mablethorpe Sand Races.—The motor races on the sands at Mablethorpe last Saturday, run by the Lincolnshire A.C. at the invitation of the Mablethorpe Amusements Committee, consisted of two events, one a handicap by distance and the other a handicap by time, both one kilometre. The course was good, but there was a slight hollow at the starting end, caused by some held-up water causing a stream which wore out a bed for itself. It had been stated that Mr. S. F. Edge, with Mr. C. Earp were to attempt record, but the conditions at the time were quite unsuitable. Mr. Edge drove over with his cousin, Mr. C. Edge, and from what he saw then, it is possible that he may make the attempt later.

The handicaps were based on the known capabilities of the cars, and scratch was represented by the 30-40-h.p. Daimler of Capt. H. E. Newsum. On the face of it, giving starts up to a limit of 400 yds. and 32 secs., it seemed that the starts were fair, but the car simply upset the handicap, making runaway wins every time it turned out, in heat, cross heat, or final. Its weight had been taken into consideration, but it got so quickly into its stride that the other cars, though far ahead, had hardly started before it was up and flying down to the judges. Another feature that affected the handicap was that some of the cars happened to be placed on loose places, and the wheels simply churned up the sand instead of moving the car. The racing was, however, very good, and there were several very close finishes, though in some of the heats, owing to bad starts, there were very easy wins.

The heats were arranged so that in the event of absentees the next on the programme was taken, there thus being no walk-overs. Mr. W. R. Pennell was starter, and got the cars off without any waiting, except, of course, for the cars running up the course for their next heats. Mr. A. A. Padley, with Major Fowler and Mr. R. Connell, were the judges. The results were as follows:—

1ST EVENT.—*One Kilometre Handicap by Yards.*

First Round.—Dr. Gilpin, 12-h.p. Georges-Richard, 260 yds., beat Mr. C. F. Crow, 5-h.p. Rexette, 340 yds., by about 50 yds.

Mr. C. Nelson, 6-h.p. De Dion, 380 yds., beat Mr. E. Brockway, 9-h.p. Clement-Talbot, 270 yds., by 30 yds.

Mr. W. Wadsley, 4 h.p. Orient-Buckboard, 400 yds., beat Mr. J. Isle, 8-h.p. Rover, 290 yds., by about 10 yds.

Capt. H. E. Newsum, 30-40 h.p. Daimler, scratch, beat Mr. T. M. Winch, 10-h.p. Century, 250 yds., by half the course.

Dr. E. Cragg, Baby Peugeot, 400 yds., beat Mr. W. Nissler, 8-h.p. De Dion, 290 yds., by 50 yds.

Mr. A. Robinson, 9-h.p. De Dion, 310 yds., beat Mr. P. Wright, 8-h.p. De Dion, 300 yds., easily.

Mr. C. W. Pennell, 16-22-h.p. Martini, 150 yds., beat Dr. Millar, 9-h.p. Peugeot, 390 yds., by 20 yds.

Capt. W. A. Cole, 12-h.p. Durkopp, 260 yds., beat Sir H. B. Bacon, 24-h.p. Wolseley, very easily, the latter starting badly.

Mr. W. Newsum, 8-h.p. De Dion, 300 yds., beat Hon. Mrs. Giffard, 12-h.p. Sunbeam, 240 yds., by 30 yds.

Mr. T. Swaby, 12-h.p. Darracq, 240 yds., beat Mr. H. May, 8-h.p. Cottereau, 310 yds., by 20 yds.

Second Round.—Mr. C. Nelson beat Dr. Gilpin; Capt. Newsum beat Mr. Wadsley; Dr. E. Cragg beat Mr. Robinson; Mr. C. W. Pennell beat Capt. Cole, and Mr. T. Swaby beat Mr. W. Newsum.

Semi Final.—Capt. Newsum beat Mr. Nelson; Dr. Cragg beat Mr. Pennell, who beat Mr. Swaby.

Final.—Capt. Newsum again ran away, winning easily, Mr. Pennell 2nd, and Dr. Cragg 3rd, but owing to some running in the semi final it was stated that Dr. Cragg was placed 2nd.

EVENT 2.—*One Kilometre Handicap by Time.*

1st Round.—The winning cars were Capt. Newsum's 30-40-h.p. Daimler, scratch; Mr. C. W. Pennell's 16-22-h.p. Martini, 9 secs.; Dr. Gilpin, 12-h.p. Georges-Richard, 17 secs.; Mr. W. Newsum, 8-h.p. De Dion, 20 secs.; Mr. J. Isle, 8-h.p. Rover, 20 secs.; Mr. A. Robinson, 9-h.p. De Dion, 24 secs.; Mr. C. Nelson, 6-h.p. De Dion, 30 secs.; Mr. W. Wadsley, 4-h.p. Buckboard, 32 secs.; and Dr. Millar, 9-h.p. Peugeot, 31 secs.

2nd Round.—Capt. Newsum beat C. W. Pennell; Dr. Gilpin beat Mr. Isle; Mr. W. Newsum beat Mr. A. Robinson; and Mr. W. Wadsley beat Mr. C. Nelson.

The final was secured by Capt. Newsum, whose Daimler again walked away; Mr. Wadsley was 2nd, with his Buckboard; and Dr. Gilpin, 12-h.p. Georges-Richard-Brasier, 3rd; but as, by the rules, each car could only take one prize, Mr. Wadsley took the trophy in this race, though, of course, Capt. Newsum remains the winner.

Saltburn-on-Sea Races on the Sand.—Beach races are now quite the fashion, and are multiplying all round the coast. The two days' meeting arranged at Saltburn for September 4th and 5th promises some good sport, judging by the extended advance programme to hand.

The Wednesday run from Luchon to Bagnères de Bigorre and back, 70 kiloms., was specially arranged for noting the regularity of running, hill-climbing powers, brakes, average speed, and comfort in riding, for the purposes of assisting in classing.

Sixty-eight cars weighed in at Toulouse and 60 actually started, all of which with the exception of one—a C.G.V. car—arrived in good time at their first day's journey's end. The C.G.V. came to complete grief about 48 kiloms. from Toulouse, apparently by reason of the utterly reckless driving of the chauffeur, Albert, when taking a particularly bad turning, of which repeated warnings had been given and special danger flags placed

GLIDDEN TOUR.—Start of the White Steam Car "Squadron" from New York.

There will be on the first day twelve races for tourist cars, classified by price of chassis, and motor cycles, and three events for racing cars. The second day will be devoted to a gymkhana, comprising the usual interesting and amusing events, the programme including no less than eleven different items. The proceedings will wind up in the evening of the second day with a procession of cars round the town, prizes being offered for the best decorated car, and the most comical car.

Races commence each day at 1 p.m. and entries close on August 30th. As the distance to be covered in all races is two miles, it is possible some new records may be put up. Two special races are scheduled for steam cars for which the entrance fees are 15s. for two-seated cars and 20s. for four-seated cars. The fees for the other tourist events range from 15s. for small cars up to 50s. for the bigger fry—motor cycles being let in for 5s. (light machines), and 7s. 6d. for cycles up to 110 lbs. weight. The racing car items are:—

Scratch race, standing start, distance 2 miles, for cars up to 1,000 kilogs. Fee, £4.

Scratch race, standing start, distance 2 miles, for cars up to 1,000 kilogs., for the Chriton Cup. Fee, £5. The car doing the best average time for three runs will be the winner.

Handicap for all and any type of car (distance 2 miles) which have run in any of the former events. Stripping cars or changing bodies not allowed. Fee, £1.

just before it was reached. One of the occupants of the car, M. Salvaire, unfortunately was reported as having died through his injuries, and a gloom was consequently cast over the rest of the proceedings. Most of the cars throughout the week have otherwise been travelling well, and when the records for each car after the finish have been tabulated, the results will be announced. The classification from these records will be arrived at by points allotted, in regard to regularity of running, consumption per total ton kilom., speed on the level and on hills, brake efficiency, starting, elegance and comfort, accessibility, &c. At each stopping place for the evening, *fêtes* and entertainments were the order of the day in honour of the unusual visit.

Vedrine Electric Vehicle Trial. — On Saturday, 19th inst, two Vedrine electric vehicles left Paris for Trouville, the object being to establish as high a speed over the distance as possible. Both cars are fitted with a single motor carried by and driving directly on, the back axle, the speed of the motor giving a range of 10 to 45 kiloms. per hour. The smaller of the two cars—which has three seats—weighs 1,580 kilogs. and has a battery of Agathos accumulators, weighing 700 kilogs., of which the capacity is 250 ampère-hours. At a speed of 40 kiloms. per hour, the normal discharge of this battery

Pyrenees Cup.—A splendid start was made last Sunday in the first stage of this seven days' trial for tourist cars. The results should prove of considerable interest to car users, as the route is mainly in the Pyrenees, some of the severest gradients in these mountains being traversed during the week. Toulouse was the starting point, and the daily runs, terminating to-morrow (Sunday) were as follows:—

	kiloms.
Aug. 20.—Toulouse to Perpignan	276
„ 21.—Perpignan to Foix ...	195
„ 22.—Foix to Luchon ...	151
„ 23.—Luchon to Bagnères de Bigorre ...	70
„ 24.—Luchon to Canterets ...	171
„ 25.—Canterets to Biarritz ...	209
„ 26.—Biarritz to Pau ...	110
„ 27.—Pau to Toulouse ...	203

GLIDDEN TOUR.—Webb Jay, who is reported to have been mortally injured at Buffalo, climbing Mount Washington.

is 60 ampères. In the larger car, which has four seats, the accumulators, which are of the same make, weigh 550 kilogs., and have a capacity of 210 ampère hours. About half way to Trouville both batteries were recharged, the larger in three hours and a half, the smaller in two hours and three-quarters. The total timed distance of 187 kiloms (116 miles) was accomplished by the three-seater at a mean speed of 20·8 m.p.h., and by the four-seater at a speed of 16·8 m.p.h.

Light Delivery Van Trials.—The arrangements for these are now complete, and the four centres, Oxford, Kidderminster, Leicester, and Cambridge, have been decided upon. The daily runs will radiate from these. The vehicles will assemble at Oxford on Saturday, September 16th, the first run taking place on the following Monday. Kidderminster will be reached on September 26th, Leicester on October 4th, and Cambridge on the 14th of the same month. There will be seven runs from Oxford, Cambridge, and Leicester respectively, and six from Kidderminster. During the stay at Leicester a day will be set apart for the tests of manœuvring, adhesion, and brake power, &c. The last day upon which entries will be received is next Wednesday, August 23rd, and it is hoped by that time there will be a really representative entry of the British motor trade. The full particulars of the rules governing these trials were published by us some months ago.

The classes and daily routes are as follows:—Class A, up to 5 cwt.; Class B, 5 to 10 cwt.; Class C, 10 to 20 cwt.; Class D, 20 to 30 cwt.

Routes.	Approx. Distance for Classes	
	C & D	A & B
<i>Oxford (Depot No. 1) —</i>		
To Brackley, Towcester, and Northampton, and back ..	57	82½

THE TOURIST TROPHY—(continued).

To facilitate reference to the various specific points raised in our article, and referred to by our correspondents, we reproduce the summary of the chief suggestions put forward by us, as also the list of the weights, measures and dimensions that are specified by the rules for this year's race.

Suggested Modifications of Rules for Future Years.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

Specified Weights, Measures, and Dimensions in the Existing Tourist Trophy Rules for this Year.

- (A) *Fuel Consumption*—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

IEWS AND OPINIONS OF OUR READERS.—V.

Mr. John Adam:—

I have read with interest your very able articles on the Tourist Trophy. I am of opinion that a trial of this kind will be of far more benefit to automobilism than the Gordon-Bennett Race. Probably some years ago the Gordon-Bennett helped very materially the advancement of the manufacture of cars, but after seeing the race held in Ireland two years ago, I came to the conclusion that its usefulness was at an end, and that what was then required was a contest on the lines of the Tourist Trophy.

What the average motorist wants is a car that is thoroughly reliable, silent, and with a considerable amount of elasticity in the engine to allow of it taking a fair hill on its top speed. This, I think, can quite well be realised with what you specify for weights, measures, and dimensions, and would probably be a car that would suit the majority of buyers, and at the same time might be built at a reasonable price.

It is impossible to make rules to cover every contingency, but I have no doubt that if the special commission who originally made the rules would consider the results after the trials have been held, they will be in the position to improve the conditions, should it be thought advisable to repeat the trials next year.

The Lanchester Motor Company, Limited:—

Referring to your article on the Tourist Trophy, we beg to state that whilst fully appreciating the action of the A.C.G.B.I. in organising an annual race for touring cars, we consider that the interests of the industry are being hampered by one or two of the regulations that the club are enforcing for this year's competition.

We think that there should be no condition which compels any manufacturer, wishing to compete, to build special cars in order to be eligible. If a manufacturer can build a car which may be heavier than the maximum limit specified in Rules 9 and 10, and is capable of successfully competing against cars of less weight, of what advantage is it to encourage a reduction of weight which might induce manufacturers to place too much importance on lightness, at the expense of durability?

We think, therefore, that while imposing a minimum limit of weight, it would be advantageous to remove or considerably increase the maximum limit.

The regulation limiting the petrol consumption is, in our opinion, sufficient restriction to induce the manufacturer to build cars as light as is consistent with reliable practice and durability, and to limit the weight of a touring car that is to be capable of carrying four passengers (including driver) excludes many manufacturers from entering an excellent competition, for which they are well qualified in all other respects.

Taking THE AUTOMOTOR JOURNAL's list of "Good points in touring car construction," we beg to suggest slight modifications: under the heading "Those which are also put at a premium in the Tourist Trophy," "Durability" should be omitted, as it is almost impossible to form any reliable opinion as to this important feature in so short a race as the A.C.G.B.I. have selected for the Tourist

Trophy. In its place, we think "Flexibility of carriage" or comfort of carriage suspension might be inserted, as this feature is one of the most important in the construction of touring and pleasure vehicles, and has, until recently, received but little attention from the majority of designers and manufacturers.

Silence might also be included under this heading, as it is open to the same conditions of judgment as such items as "Smokelessness" and "Absence of Vibration."

Rule No. 16 covers the admission or otherwise of freak devices. It may be opportune to remind the public, however, that it is to the so-called freaks that the industry is indebted for many valuable improvements, and it would, therefore, be well not to be too hasty in eliminating them from the Tourist Trophy Competition.

MANAGING DIRECTOR

Mr. Mervyn O'Gorman:—

Personally, I think the Tourist Trophy promises to be the most brilliant step the club has yet taken and the finest thing in races yet devised, interesting, nay, thrilling to the last degree—amusing, just in the way sport should be amusing by the patent discomfiture of those who are either too thrifty of petrol to arrive in time, or too greedy of speed to arrive at all. It is a competition between scientific researchers, between practical mechanics and between drivers who are not only skilful at bullying the most out of a car, but at coaxing it into its best behaviour.

I think that when your articles have been read and thought over, the public may better appreciate what a boon this Tourist Trophy is attempting to secure for us all, and thereupon if there should ensue a timely dipping of the hand into the appropriate pocket, a Grand Prix might result indirectly from your labours, to reward the ingenuity and labour of competitors, and to establish it on an international basis.

It has been admitted from the beginning that many minute technical flaws may exist which the first experiment will disclose, and which will be all the more easily detected from having been in many cases anticipated by your articles and your correspondents' letters.

You do not, if I remember rightly, touch upon the incentive that will be given to securing a method of ignition which shall be thorough and perfectly synchronized as between the various cylinders by the rule calling for fuel economy; yet this is so, for the poorer the mixture the greater the necessity for a perfect igniter. The automatic timing of the spark for maximum output is at a premium also, because it frees the driver from an additional worry and saves fuel. Poor mixtures must be more fully ignited if they are to propel the car any further or any faster than rich mixtures per gallon of fuel.

A large experience with oil and gas engines for electrical purposes seems to show that each engine has a well-defined speed of rotation at which it is most efficient in respect of fuel. This may lead to surprising advances in the event of the Trophy becoming popular. I do not only mean that the best speed ratio of engine-crank to road-wheel will be studied with great advantage to everyone, but that the "infinitely" variable gear may receive an unexpected encouragement, while slow pulling or flexibility may receive an

unexpected discouragement from the race, both by reason of the superior fuel economy of fewer cylinders, and by the fact that the race affords no particular advantage to a car that can crawl "on the top notch."

A matter, the study of which will be favourably affected by the "Trophy," is the size of wheels, another is the power loss in tyres and in ill-fitting brakes, another is the heavy power loss in inefficient second speeds. Clutches do not stand to profit much, nor do chassis designs, nor silence, nor dustlessness, nor smokeless lubrication, save remotely, nor springs, nor absence of vibration. Ball and roller bearings will gain, and so will axle strengths and care in design of differentials and Ackermann steering to avoid rub of tyres. The chain *v.* bevel drive discussion may be finally settled if efficiency is to be the password. Whether we may yet rake in most outstanding car requirements, and make them essential to winning this race, remains to be seen, and depends on the ingenuity and technical skill of the Technical and Races Committee of the club, and the support they are given by the makers and the public.

Although I do not think with Mr. Rolls that motor racing under the one tonne limit, which he describes as "motor racing pure and simple," has completed its work of encouraging the research for finer steels, improving the girder construction, wheels and tyres for heavy strains, carburettors for maximum output, I do think that the A.C.G.B.I. has made a most opportune move at the time when the Gordon-Bennett race is about to be relegated temporarily to an inferior position.

Mr. G. E. Whittaker

Mr. G. E. Whittaker:—

I have read with a good deal of interest the three articles on the Tourist Trophy Race in your issues for the last three weeks of July, as I feel sure every man connected with the trade has done. Although it is undoubtedly too late at the present time to hope for, or even wish for, any alteration in the existing rules covering the Tourist Trophy Race for this year, I have little doubt that your articles, in which some of the main points, which seem to have been not too well considered by the Committee which drew up these rules, will cause some alterations in rules for future events of this description. I think that you and some of your correspondents who have written you on this subject are perfectly correct in assuming that it is a type of competition which in future will prove of most interest to the general public, and will overshadow such meetings as Brighton and Blackpool.

I am far from advising that meetings held for the purpose of speed trials should be discontinued, because I am most decidedly of the opinion that an introduction of high-powered cars into counties and towns where there is at present a marked hostility to the motor movement will be productive of good results, because it will enable the public in these localities to see for themselves that motoring is not dangerous.

Possibly you may care for a few opinions of mine on the subject of your articles, as representing the selling department of a motor manufacturing company as opposed to the purely productive or constructional department.

Dealing with the eleven chief points raised in your article, I would first of all beg to suggest that there will be little practical utility in having bodies, as you suggest, made in four independent parts. It is purely a question of convenience, doubtless, that enters into your mind, but although I have read your articles very carefully, I do not altogether see what practical purpose would be achieved by this novelty in construction.

With regard to the second point, this, to my mind, raises the whole question of the description that must be applied to the event, and I shall deal with this point under No. 6.

Nos. 3 and 4 may be grouped together at the present stage of motor construction, for at the moment a car possessing more than four forward speeds would probably partake of the nature of a freak, even if only in this respect, and the final problem of transmission in motor cars has yet to be solved, so that a car which at the present time may seem to be a freak, may have within its freakish construction the embryo of an idea, which if produced and further developed may very well revolutionise many a point connected with the construction of motor vehicles.

Nos. 5 and 6 is a point upon which I think we might all very well agree, because this Tourist Trophy Race is surely for the purpose of bringing before the public the most desirable car, and the car which is noisy is not desirable. On the other hand—I am now passing to No. 6—if you admit any other cars but those possessing more than four or more cylinders, the two-cylinders would suffer by comparison, and may be described as noisy. This brings me to the question raised in No. 2. The Tourist Trophy should be, I think,

a test of absolute reliability, and speed should be a secondary consideration, so that I think it will be rather unfair to handicap the single cylinder cars and the two-cylinder cars, which must attract a very large section of the public who would be inclined to take up the pastime of motoring were it not for the expense; and to have such a sweeping recommendation as that conveyed in your two propositions, would instantly put out of court certain small cars which have proved themselves to be full of reliability and possessing a fair amount of normal speed. Amongst others, the single-cylinder De Dion cars and the single-cylinder Argylls, as well as others less extensively known, would suffer, and the selling agents of these cars might very well ask that a special trial be conducted for their benefit. If you extend your race for two, three, or more days, you in effect bring this Tourist Trophy Race of yours into line with reliability trials, and if you do this I suggest that you do it on the lines of the recent Meyan-Siddeley sporting match, which would be the best for all purposes. This event had one clause in it which made it more or less a race, which was that the cars must not go at a lower speed than 25 kiloms. per hour, and it strikes me that if you have a similar rule with regard to the future Tourist Trophy events, that this will be quite sufficient. Furthermore, if you propose to increase the time of the race to make it extend over more than one day, I suggest these modifications:—

First of all, that no manufacturer shall enter more than two cars, no matter how many types he builds.

Secondly, that the same remark applies to agents in England who have various cars under their control.

Thirdly, that the race be open, not only to four-cylinders and more, but also to cars possessing one, two, or three cylinders, on condition that the restrictions given in my Nos. 1 and 2 be strictly observed.

Fourthly, that no private owners be allowed to put other cars in.

Fifthly, that the tour (for it would resolve itself into nothing less) be undertaken all over England, with the exception of those counties which have proved themselves notoriously inimical to the motor movement, and that, if necessary, Scotland be included as well.

Sixthly, that the cars must do 180 miles per day, and that, excepting during controls, a speed of not less than 18 and not more than 20 miles an hour be averaged in each separate mile.

Seventhly, that the tour extends for 2,000 miles.

Eighthly, that no allowance be made for punctures, for if a car is properly designed, it will be shod with such tyres as will preclude to a certain extent all possibility of punctures whilst on the trip.

Ninthly, that no time be allowed for replenishments, change or mechanical parts, or anything else.

Tenthly, that an observer be called on board to see that the speed rule is not infringed, but that the observer is not to help in any road stoppage in any way, nor is he to make notes of mechanical stoppages, and that if after one warning from your observer the driver continues to disregard the speed limit he shall be disqualified.

You will see that there is nothing in these rules which upsets No. 11 in your article, and as regards No. 10 I do not think that it would be advisable to have different drivers handling the car each day, because it would be rather hard on the manufacturer, for two reasons. First of all he would have to take a good number of skilled drivers (and these are not to be found every day), and, secondly, a car would run better in the hands of one competent man than in the hands of six incompetent men.

Doubtless these hints of mine for the Tourist Trophy Race will seem rather revolutionary, and in a way they are an endeavour to form some sort of junction between the present Tourist Trophy Race and the reliability trials of 1900, which was splendidly organised by Mr. Claude Johnson, and was, I consider, the finest advertisement the motor industry ever had in England.

C. E. Whittaker

THE tri-car competition organised in Paris by *L'Auto* is announced to take place on September 10th.

To the Right or to the Left, is the question which has arisen in America over the Vanderbilt Cup race course. Official views are in favour of traversing the course to the left, as some of the worst corners would have to be taken on the down grade if the race were run to the right.

SPA automobile week, postponed from August until September, it is now announced, has been altogether abandoned.

ONLY last week we recorded severe accidents in America, whilst racing on the track, to Barney Oldfield and Earl Kiser, the latter's accident occurring when competing against Webb Jay on a White steam car. Webb Jay himself is the latest victim to the use of utterly unsuitable tracks for high speed cars. On Saturday last at Kenilworth, Buffalo, U.S.A., when trying, on his White car with which he made the record time for the mile, to lap Burman and Lyttle, he charged the barriers full tilt, owing to the blinding dust of his opponents, and came utterly to grief. At the time of going to press Jay is reported as so badly injured that very little hope of saving his life is entertained.

SCENES ON THE GLIDDEN TOUR.—A race between two 15-hp. White cars near the Berkshire Hills, U.S.A. By the scenery, the photograph might easily be mistaken for a Berkshire lane in Great Britain.

MOTOR BOATING.

The British International Cup.—The full British team for this event has now been finally selected by the Motor Yacht Club as follows:—Napier II. (Hon. J. Scott Montagu and Mr. Lionel de Rothschild), Napier (Lord Howard de Walden), Brooke I. (Mr. Mawsdley Brooke and Capt. Corbett). There will be no reserve boat. As the direct result of the eliminating trials, Competitor was obviously entitled to a place in the team, but Lieut. Mansfield-Cumming, R.N., found it necessary to withdraw his boat as he cannot get her ready in time, and for this reason Brooke I. is now in the team instead.

Certain modifications have quite lately been made in Brooke I., as the result of the really drastic experiments which this boat has been through lately. Everyone who saw the eliminating races will remember how "wet" Brooke I. was at full speed, and, in order to make life at the helm somewhat more bearable if less exciting, the deck forward has now been raised 12 ins.

Much stronger valves have been fitted to the engine, and the carburettor, instead of being entirely "automatic," is now subject to hand control. With the engine running at 850 revs. per min., the boat will attain a speed of 26 knots, and at 1,000 revs. per min. the estimated power of the engine is 425-h.p. Now that these alterations have been made, Mr. Brooke expresses himself confident of the boat proving herself in every way satisfactory—we can only hope that his confidence may be fully justified—when she is put to the final test in the Bay of Arcachon.

Lake Lucerne Meeting.—In spite of the many obvious attractions which Lucerne offers to the motor boat owner, but a very meagre list of entries was received for the race meeting on the lake which commenced on Saturday last. The meeting was nevertheless a popular success, as the general public made the racing an excuse for boating, every available craft crowded with visitors being

out and about on the water. On the first day, Saturday, the cruiser events were run off, the results being as follows:—

Series 1 (under 6½ metres) 51 kilometres.—1. Mendelssohn (Mutel motor) 2h. 13m. 54s. 2. Delahaye V. Nautilus (Delahaye motor), 2h. 18m. 23s. 3. Lanturlu (De Dion motor), 2h. 46m. 58s.

Series 2 (6½ to 8 metres) 59 kilometres.—1. Excelsior VII. (Picker motor), 2h. 26m. 31s.

Series 3 (8 to 12 metres) 68 kilometres.—1. Delahaye VI. Nautilus (Delahaye motor), 2h. 5m. 11s. 2. Tetu (Delahaye motor), 2h. 15m. 14s.

Extra Reglementaries.

Series 1, 59 kilometres.—1. Pertinsane (Panhard motor), 1h. 59m. 50s.

Series 2, 68 kilometres.—1. Mary Madeline (Panhard), 2h. 13m. 24s. 2. Roosevelt (Pucker-Moccand), 3h. 34m. 40s. 3. Habsbourg (Daimler), 4h. 18m. 15s.

The turn of the racing craft came on Monday, and scarcity of competitors in this class was more pronounced than with the cruisers. Legru-Hotchkiss did not attempt to start, leaving only Rapière and New Trèfle to fight out the battle. In order to provide a semblance of sport, therefore, the offer of the owners of Delahaye VI. to run as a racer was accepted. These three, therefore, were started, but mishap overtook Rapière when turning too sharply in the heavy wash made by M. Thubron's New Trèfle, the steersman being half blinded by the spray. She struck on a rock, smashing her screw, and knocking a hole in the boat. La Rapière very quickly settled down into deep water, fortunately, however, her crew were almost immediately rescued. This accident left New Trèfle an easy winner of the Lucerne Cup, in 2h. 47m. 57s. for the 114 kiloms., Delahaye VI. making a fine shewing for her class with 3h. 28m. 48s.

In an extra race for cruisers over a distance of 51 kiloms., Excelsior VII. was timed for 1h. 55m. 37s.

We recently published, as a frontispiece, a view of Lake Lucerne, and again this week we give another charming picture of that delightful holiday resort.

MOTOR CYCLING.

AUTO-CYCLE CLUB'S RELIABILITY TRIALS.

In the accompanying table we have summarised the results in our usual form, but the data at present available is unofficial. Comparatively few machines, it will be noticed, had engine troubles, but punctures were, as usual, very prevalent. Three retired on account of accidents through side-slip or collision, but some others were placed *hors de combat* by failure of their machines. Of these latter, however, No. 26, the Mototri-Contal, driven by Monsieur Gaston Rivierre, continued running unofficially after repairing the damage sustained on the first day, and No. 32, the powerful 12-h.p. Riley tri-car, also attempted to continue after once breaking down, only to fail again, however, by the frame giving way.

TABLE OF UNOFFICIAL RESULTS.

No.	Machine and Driver.	Performance.						Honiton Hill.

EXPLANATION.

* Continued running unofficially. A Lost time owing to storm.
H Stopped on hills. P Puncture. R Retired. S Stoppage, cause unknown. NS Non-stop run.

CAUSES OF STOPPAGES WHERE KNOWN.

1 Replaced tube. 2 Broken balls in back wheel. 3 Tightened belt. 4 Ignition, engine trouble, and choked petrol pipe. 5 Broken plug. 6 Replaced tube. 7 Exhaust-valve trouble, new pulley. 8 Broken belt. 9 Changed exhaust-valve and accumulators. 10 Broke contact-breaker through side-slip. 11 Contact-breaker trouble. 12 Ignition. 13 No petrol. 14 Carburettor trouble. 15 Carburettor trouble. 16 Ignition and new spokes to wheel. 17 Broken bolts in back wheel. 18 Adjusting gears. 19 Accumulators run down. 20 New plug. 21 Lubricated gears and took in water. 22 Repair to frame. 23 Broken chain and exhaust-valve trouble. 24 Circulation and ignition. 25 Circulation. 26 New plug. 27 Lost water. 28 Took wrong route. 29 Lost water.

CAUSES OF RETIREMENT.

Nos. 4, 12, and 17 Retired through accidents to rider and machine. No. 10 Unknown at present. No. 24 Siezed piston. No. 26 Stripped gears. No. 27 Broken cam-shaft wheel. No. 32 Siezed gear when going up Birdlip, but after replacing parts continued unofficially and again broke down.

HILL-CLIMB.

No. 6 Restarted on hill. Nos. 7, 11, and 30 Arrived too late to be timed.

On Saturday, August 19th, twenty-four, out of the thirty-one machines which started, finished the six days' reliability trial which the club had been holding the previous week. Altogether 769½ miles had been covered, which entailed a daily run of considerably over 100 miles, to be repeated on six consecutive days—a trial well calculated to at least show up serious defects, and, even if not a direct proof of reliability, at least a sound indication of general good qualities.

Oxford, Worcester, Gloucester, Bristol, Exeter, Southampton, Brighton, Eastbourne and Folkestone were among the principal places visited *en route*, and occasionally the road ran over hills of no mean magnitude, the steepest of all being the famous Birdlip, which was encountered on the second day after leaving Gloucester. Dinsmore Hill, near Hereford, was made the penalty hill of the whole run, any machine not surmounting it losing marks. Times were taken on Reigate Hill and also on Honiton Hill, and the latter, being those only which are available, will be found in our annexed table of results. A brake test also was held on a hill just past Reigate, and a "stop and start" test for free engine machines was held on another hill which had a gradient of about 1 in 25.

The difficulty of organising and carrying out such a trial are very considerable, and great credit is due to Mr. Straight and other officials of the club for the excellent manner in which the whole arrangements were carried through without a hitch. The method of checking the machines was to provide a schedule time of running (within the legal limit) and a speed between controls of not less than 15 m.p.h. Any one going faster or slower than the limits imposed was liable to lose marks, but all those arriving to time had no marks deducted, no matter what stops they might have had on the road. In addition to this, however, a system of observation was also employed by which wayside troubles to bicycles were recorded when seen either by the observers on the tricars or officials of the club, and thus those competitors of Class I. who are not shown to have stopped may be considered as having had no trouble whatever, although they cannot, under the conditions, be *officially* accredited with having performed a "non-stop" run.

NEXT Saturday, September 2nd, the Auto-Cycle Club Consumption Trial is due, a start being made at 2 p.m.

ANOTHER penalty run is to be held by the members of the Auto-cycle Club and affiliated clubs on September 23rd. The route will probably be in the eastern counties, the competitors starting at 2.30 p.m. The entrance fee is 2s. Any competitor who makes a stoppage of any kind will be fined 6d., and any competitor failing to finish within the schedule time will be fined 2s. 6d. In any case the amount of the fines will be limited to 2s. 6d.

THE Auto-Cycle Club calls the attention of motor cyclists to the fact that under the rules of that club, any club or persons taking part in an open motor cycle competition for which a permit from the club has not been obtained, is liable to be suspended from taking part in any competition held under the rules of the club. The Motor Cycling Club has announced the holding of an open competition on August 26th, 1905. The Auto-Cycle Club, under date of August 16th, desire to point out that no permit for this competition has been granted by the Auto-Cycle Club.

AUTO-CYCLE CLUB RELIABILITY TRIAL.—A batch of the survivors on Saturday, the last day, ready to start from Eastbourne. *Photo by Campden-Gray.*

Motor Cycling on the Continent.—The secretary of the C.T.C. has just been informed officially that the motor bicycles of its members who wish to tour in France may pass the French Customs Houses without payment or deposit of duty—in fact, that in future, members of the C.T.C. may enter into France with their motor cycles under the same conditions as with ordinary cycles. This concession not only throws open France, but the whole of

Europe free of duty to the member of the Cyclists' Touring Club furnished with the necessary ticket, as members of the club have already been granted free entry with their motor cycles into Germany, Holland, Belgium, Italy, and Switzerland. Full information as to these important concessions may be obtained on application to the Secretary, Cyclists' Touring Club, 47, Victoria Street, Westminster, S.W.

The Progress of the "Pedrail."—Hitherto, the law in this country has stood in Mr. Diplock's way, and has prevented his wonderful Pedrail vehicles from being legally used on the King's highways, since they do not conform with the Local Government Board regulations that have hitherto been in force. That, however, is now changed, and Mr. Diplock is to be heartily congratulated that the Board, after having communicated with a number of the local authorities, and after having carefully considered the matter in all its details, have now issued the requisite Order authorising the use of Pedrail "locomotives" on highways. The actual Order itself, dealing as it does with a highly difficult technical matter, is very skilfully drawn up, and obviously shows, on the face of it, the care with which this clever invention has been studied by the Government officials concerned. Incidentally, too, the new Order is significant, inasmuch as it cannot but be regarded as giving some indication of the opinions that have been formed by those Government experts who have been deputed to conduct or to witness the practical tests carried out with Pedrail engines during the past year or two. Our readers are already familiar with the constructional details of the various experimental "Pedrails" that have been made, as also with the results of the successful trials conducted with them, and they will therefore learn with interest that Mr. Diplock has quite recently introduced some still further improvements in his designs, and that he intends building another "engine" very shortly. We wish him the success which his perseverance, and his plucky undertaking in the direction of revolutionising heavy road-traction, undoubtedly deserve. It will be remembered that the fundamental principle of these "walking" vehicles is that of causing the car to lay its own railway on any ordinary road—or even across the roughest or softest ground—and to glide along over it as smoothly and almost as efficiently as a train does on its permanent way.

Automobile Club Driving Certificates.—Examinations for obtaining the Club's driving certificate will be held in London on Tuesday next, the 29th inst. Application forms and all information can be obtained from the Secretary, 119, Piccadilly, W.

Emission of Smoke.—We referred recently to a case in which the owners of an automobile were summoned "for that their car was not so constructed as to consume its own smoke as far as possible." Mr. Denman, before whom the summons was heard, adjourned it so as to fully consider it, and has now given his decision. He decided to convict, stating that, in his opinion, the Act referred to some unforeseen accidental occurrence, not to something constant and recurrent, and he further held that the owners or persons "using" such car for their benefit, and not necessarily the actual possessors, are the persons upon whom responsibility as to using machines not constructed so as to practically consume their own smoke rests. With all due deference to Mr. Denman, and much as we think the emission of smoke tends to injure the automobile movement, we cannot regard his finding as legal, for, as we said last week, no indictment under the Motor Car Act can be framed as given above.

CLUB DOINGS.

Blackheath A.C.—To-day, Saturday, a joint meeting with the Kent A.C. has been arranged to be held on the private road in the grounds of Holwood, Keston, the seat of Earl Derby, entering by the Orpington Lodge gates of the park.

North London A.C.—The fixtures of this club in the near future are, starting each day at 3.30 p.m. from headquarters:—August 26th, Harpenden (George Hotel); September 23rd, Hertford (Green Dragon); October 28th, St. Albans (Peahen Hotel).

Meet of the Leicestershire A.C. at Mr. J. A. Corah's residence, Oadby Hill, Leicester, on August 12th.

A Recipe for Police Traps.—When setting a police trap be careful not to select the near neighbourhood of a market garden, for in such labour market gardeners and their assistants, who are at times honest men and stiff and sturdy under cross-examination. In the neighbourhood of such a garden on the Lower Shoreham Road was recently set a police trap, into which fell Mr. Stuart Peebles, while proceeding at a rate of about 14 miles per hour. The policemen, of course, swore that the pace of Mr. Peebles was, as usual, 30 miles per hour, no more and no less. Mr. Frith, who defended, however, produced in the witness-box a phalanx of the market gardeners and their men, who all swore that the car of Mr. Peebles was going so slowly that it was not even raising the dust. The Shoreham Bench, impressed by the rustic *bonâ fides* of the market gardeners and their labourers, dismissed the case. Had the witnesses been country gentlemen, University professors, or even Cabinet Ministers, the Bench would no doubt have believed the police, but in the eyes of the Shoreham Bench market gardeners and their labourers could not lie! "*O sua si bona norint agricolæ.*"

THE skulking blackguards who strew broken glass on roadways to injure motor cars and bicycles are so seldom caught, that universal regret will be felt that one Arthur Leonard Phipp, who was detected indulging in this amusement at Bishop Stortford recently, should have been let off with a fine of only 16s.

MR. EDGAR WILSON, who has devised an alleged flying machine, and who was prevented some time back by the police from attempting to put it in operation from the parapet of Westminster Bridge, has been making an attempt with it at Wembley Park, where an experimental stage for the purpose was rigged up by the edge of the lake. When launched, the flying machine took a header direct for the water, and did about as much flying as would a stone dropped from the same place. But Mr. Wilson remained aloft stuck in some tackle, and was ultimately rescued and brought to earth not without difficulty. He says: "Once I solve the principle of balance, and have got a suitable motor to propel the machine, the rest will be easy." It will, no doubt, for that is nearly the whole of the problem.

Alterations of a sweeping nature are being made in the annexe at Olympia for the November Show of the Society of Motor Manufacturers and Traders. That the interests of exhibitors in the new annexe are being well provided for is clearly demonstrated by the above two photographs secured recently, showing the "gutting" process which is in progress.

H.M. King Edward's 40-h.p. Mercedes Car in the Hotel Yard, Marienbad.

A CERTAIN Capt. Beresford recently wished to take his car into Cardiff Docks, but as it contained petrol he was not allowed to take it inside the dock gates. To get over the difficulty he ran the petrol out into a bucket, and poured it down a gutter-sink in the street. The ultimate result was—some time subsequently—an explosion and fire, the “flames shooting up nine or ten feet into the air,” and very much frightening Policeman Rowse. Summoned for thus dealing with his superfluous petrol, Capt. Beresford was let off on payment of costs of the proceedings. But we trust he now realises what a very silly thing he did.

Smart and quaint are the new ideas which so continuously emanate from the firm of S. F. Edge, Ltd., in bringing into prominence the many useful innovations which they introduce. The above “medal” is the latest of these to hand, which is presented with each Speedometer purchased from them, so that the owner can hang it on his car and exhibit it to over-zealous constables, as a silent talisman, to moderate the somewhat distorted views usually held by them of the speed of carefully-driven cars.

PHOTOS BY LIEUT. W. WINDHAM.

The King's first ride at Marienbad. This photograph was taken by Lieut. W. Windham, who afterwards accompanied His Majesty in his car to Glatzen, Saugenberg, and Podhomburg.

A MILITARY automobile corps for the German Army has been created by the Emperor. It consists of 33 automobiles, will be commanded by Baron von Brandenstein, the President of the German A.C., while Prince Henry of Prussia is Colonel-in-Chief. All the cars are to take part in the military manœuvres between Frankfurt and Coblenz to be held early next month.

EVERYONE will feel sympathy for the Queen-Mother of Italy with regard to the accident of which she was the victim, near Aosta. Her Majesty was travelling at considerable speed when her car ran into a heap of stones, which it is believed in some quarters was purposely placed there by anti-automobile-monomaniacs. The car was smashed up, but, fortunately, neither Queen Margherita nor the other occupants were injured.

One of the Motor Omnibuses which have been doing such good work in Birmingham for some time past, was recently fitted with a 27-h.p. Maudslay motor in order to give that type of engine exhaustive trials under the precise conditions that prevail in that city. Our illustration shows this vehicle while undergoing these trials, which were undertaken with a view of giving the Maudslay Motor Company an order for some of their complete omnibuses. The 27-h.p. engine is of the three-cylinder type, having a bore and stroke of 5 inches, full particulars of which were given by us in an illustrated description of the Maudslay vehicles on February 11th last.

THE inquest at Newhaven on William Collins, the chauffeur who was killed through the accident to Mr. Brown's racing car at Brighton, was further adjourned on Monday for two months, owing to Mr. Brown still being detained in hospital and unable to attend.

THE anti-motorist Swiss agriculturist who assaulted Mr. George J. Gould near Kussnacht for being in an automobile, has recently been convicted by the Court at that place. He has been let off with one day's imprisonment and a fine of one franc, but he had to pay costs to the amount of 160 fr.

INNOVATIONS to be made in connection with the Paris Automobile Salon, in December next, are: (a) A competition for hackney cars (electric, petrol and petrol-electric); (b) an exhibition of designs by leading artists for improving the appearance of cars, some tempting prizes being offered to successful competitors.

WE desire to remind our readers that the 30th inst. is the last day for re-registration of *heavy motor cars which were registered prior to March 1st, 1905*. No such vehicles which have not been re-registered by that date can be legally run subsequently, and owner and driver will both be liable to prosecution.

LORD PORTSMOUTH is an enthusiastic motorist, so, having discovered a police trap on the outskirts of his Hurstbourne Park estate, he put up a number of notices to this effect:—

"Motorists Beware! Police Trap.—Portsmouth."

Nevertheless a number of motorists fell into the trap, from which it may be concluded that they were unfamiliar with the aristocratic style of signature and imagined that the police were ambushed near the town from which his lordship takes his title, and which is not very distant!

SCOTTISH RELIABILITY TRIAL.—The gold medal and reverse issued by the Scottish Club in connection with their Reliability Trial held a short time ago. The particular medal from which our photo was taken was secured by the 20-25-h.p. four-cylinder "All British" Ariel Car in Class C (petrol cars having three or more cylinders).

COMMANDER DAWSON, R.N., who is interested in the Missions to Seamen, writes to the papers, from 11, Buckingham Street, W.C., asking for a motor boat (or £300 to buy one), to be placed at the service of the Missions for boarding British sailing ships as they arrive in Hamburg, so as to be beforehand with the "crimps."

THE High Street at Epsom is, we learn, to be closed for repairs, subject to the weather being suitable, from August 28th to September 3rd, and it is satisfactory to know that the opportunity will be embraced of giving "Tarmac" a trial in that town. During the road repairing operations the traffic will be deflected to East Street, South Street, and along Warple Road as far as Heathcote Road.

"Should it ultimately be determined to substitute steam motor vans for street sprinkling instead of horsed vans, one motor van with a capacity of 1,000 gallons, travelling at a speed of five or six miles an hour, would be equivalent to possibly five of our present vans."

Such is the expressed opinion of Mr. W. N. Blair, surveyor of St. Pancras, in his report to the Borough Council.

ADDRESSING a meeting recently at Hawley, near Camberley, the Right Hon. A. F. Jeffreys, M.P., Parliamentary Secretary to the Local Government Board, took a very fair view of the motor car question, and expressed his confidence in the Royal Commission making a satisfactory report on the subject. He also pointed out that future legislation would be based on that report.

At a recent gymkhana at Yarmouth, an event was arranged in which the competitors were policemen. A car was run along a track, and five policemen guessed how fast it was going. Of course, the spectators thought that a fine object lesson would be provided. The policemen were, however, far too wily to be "hoist with that petard," and the highest estimate was 18½ m.p.h. The car was actually going at 27 m.p.h.

Lieut.-Col. Mark Mayhew, the Commander of the Motor Volunteer Force, at the steering-wheel of his 40-h.p. chainless Napier car. The car in which he is shown in the photograph is the very latest and most up-to-date four-cylinder type turned out by the Napier firm. It has been in constant use by Lieut.-Col. Mayhew since the spring of this year, and he christened it by a drive to Nice and back.

THE Duke of Ratibor has been unanimously re-elected President of the German A.C.

DR. McCLEARY, the Medical Officer of Health for Battersea, is an expert who fully recognises the insanitary effects produced by horse traction, as he recently declared that

"Future generations of Londoners will find it difficult to believe that such a disgusting state of things was tolerated at the beginning of the twentieth century. The disappearance of the horse from the streets of London would be a sanitary reform of the first magnitude, and anything, therefore, which tends to improve and cheapen mechanical traction tends to improve public health."

WE wish when magistrates undertake to lay down the law that they would take the trouble to previously study it. This remark is based on a report to the effect that Mr. Reynolds, the magistrate sitting at Highgate Police Court, informed a defendant who was brought before him on the usual charge, and whose licence was fixed on his car, at present at the seaside, that he could be fined £10 for not producing it. Was anything so preposterous ever heard of? What the law says is that where a driver is convicted he shall be liable to a penalty if he does not produce his licence for the conviction to be endorsed thereon within a reasonable time. He is no more obliged to bring it into court with him before conviction than to take it to bed with him at night, or hang it round his neck when bathing in the sea. The police very frequently try to induce a defendant to produce his licence in court before conviction, in order that the magistrate may see if there are any endorsements on it, but they have no legal right to compel this, and every defendant may justifiably refuse to produce it under such circumstances.

It is a great convenience on a car to carry the main supply of lubricating oil in a special tank, and to be able to refill the lubricator on the dashboard from it without having to actually handle the oil at all. The above illustration shows the supply tank and the special semi-rotary pump which are now fitted to Napier cars for this purpose. They can be fixed in any convenient positions. When connected up together, and to the lubricator, a few strokes of the hand-pump enable the lubricator to be refilled at any time. The arrangement forms just one of those simple little devices which appeals so forcibly to the owner of any car.

OWING to the delights accompanying the laying-down of new tram-lines, traffic through Kingston has been diverted from the London Road to the Liverpool Road, an enlivenment of their solitude which some of the Liverpool Roadians do not appear to appreciate, as no less than sixty Blakey's Boot Protectors, with the points in the air, were picked up on a recent Sunday morning, carefully and equably distributed upon the surface of the Liverpool Road.

A GENTLEMAN, whose name we do not give, as we have no desire to pillory him as an idiot, went out the other evening, in a town not many miles from London, to look for a leak in a petrol tank with a lighted candle. *He found it*—and when a police constable found *him* he was burning away as merrily as any of the human sacrifices with which Nero is said to have emphasised his dislike of early Christianity. Fortunately he was not fatally, although seriously, injured.

RECOGNISING the importance of providing training schools for motor car drivers, the Technical College sub-committee of the Bradford City Council has determined to organise classes for this purpose in connection with the technical college of that town. The City and Guilds of London Institute also proposes to add to its programme a syllabus on motor car engineering, the courses to last two years and examinations will be held at the end of each year.

A new type of De Dion-Bouton heavy or commercial vehicle. Formerly these vehicles were fitted with steam engines, but about two years since the manufacturers decided to give up steam, and have from that time fitted petrol motors exclusively. This particular vehicle has a 15-h.p. 4-cylinder motor, sliding pinion gear, patent metal-to-metal disc clutch, and the regular De Dion-Bouton cardan axle drive. The carriage body is constructed to carry 20 persons. It was made to the order of, and is run by, Mr. E. Poulain, of the Haven Hotel, Sandbanks, Parkstone, Dorset. Mr. Poulain writes: "The 'bus does 8 trips a day over 70 miles, and every trip has been exact to the minute. The mechanical part is admirable. Since the 15th April, when we set out from Paris, the machine has travelled every day, and we have not had a single difficulty, after having covered 6,500 miles."

COMMERCIAL POINTS.

The Prince of Wales' Indian Tour.—For the use of the Prince of Wales during his forthcoming Indian tour, one of the Indian Maharajahs has secured for His Royal Highness a Fiat car. For this lengthy journey Dunlop tyres have been specially selected.

In the recent trip from London to Paris, undertaken by Mr. Louis Carle, of the Mors Company, on a 24-h.p. Mors car, this company write that the Continental tyres, with which the car was fitted, not only gave no trouble whatever, but although some of the roads were in an extremely bad condition, the tyres look as if they had been driven on a wooden pavement. We also learn that in the recent Herkomer Trophy competition the cars securing 1st, 2nd, 3rd, and 4th places were fitted with Continental tyres, and that out of the first 12 winning cars 10 were fitted with Continentals.

QUITE a number of motor omnibuses are now being turned out by the Great Eastern Railway Company at their Stratford works for use as feeders between the outlying districts in the vicinities and the nearest stations on their line. These vehicles, which are of the chain-driven type, have 4-cylinder engines of about 30-h.p. Like the Mors omnibus which was conspicuous in the recent French trials for absence of tyre troubles, and like the omnibus purchased by H.M. the King for use at Osborne House, they have Sirdar tyres on all four wheels.

DIXI MOTORS, LIMITED, advise us that they are sole agents for Great Britain and the Colonies for De Mirovitch's patent motor goggles.

For the Tourist Trophy Race a tyre of a new pattern—the "Modele de Course"—has been brought out by the Continental Tyre Company, who inform us that, as a result of the 100-guinea cup, offered by them in connection with that forthcoming event, about half the competing vehicles will be shod with Continental tyres. The other tyre makers are also making arrangements to supply specially suitable tyres for the race, and it is therefore to be hoped that *this* element of luck will be largely eliminated in the contest.

NEW COMPANIES REGISTERED.

De Cadignan Resilient Wheel Company (Limited).—Capital, £25,000 in £1 shares. Object, to acquire the business of the Société de Cadignan et Cie., of 28, Avenue de Neuilly, Neuilly-sur-Seine, France, hitherto carried on by G. E. de Cadignan, of wheel and tyre manufacturers and vendors, motor car builders, &c. First directors, J. G. Dalzell and G. E. de Cadignan.

Gaulois Tyres (Limited).—Capital, £20,000 in £1 shares. First directors, J. P. Gauthier and T. Schneider.

Wilton-Cox Motor Tyre Company (Limited), 76a, Suffolk Street, Birmingham.—Capital, £5,000 in £1 shares.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E. Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

18384. 23rd July, 1904. Improvements in and relating to Self-Propelled Vehicles and Vessels. Percy Martin, of the Daimler Motor Company, Limited, 219, Shaftesbury Avenue, W.C., and Dick Kerr and Company, Limited, 110, Cannon Street, E.C. This invention relates to power transmission in self-propelled vehicles. In applying internal combustion engines to vehicles for road or railways, especially where great tractive efforts are necessary, it is essential that means be provided to allow of large starting efforts, a variable tractive effort and speed, and reversal of motion. There are six figures.

Fig. 2 is a part plan. Two internal combustion engines, *a, b*, are placed one on each side of a longitudinal shaft, *c*, with their crank shafts, *d, e*, parallel to the shaft. On the crank shafts, *d, e*, are mounted two main clutches, *f, g*, operated by levers whereby the engines may be put into or withdrawn from engagement with the transmission gear without shock. The engines by means of the clutches, *f, g*, drive two intermediate shafts, *j, k*, in a gear box, *l*, between the engines. On each of the shafts, *j, k*, are mounted a small and large pinion, *m, n*, respectively; the smaller pinions, *m*, are permanently

geared to the larger, *o*, of the gear wheels, *o, p*, which are loosely mounted on the longitudinal shaft, *c*, the larger, *n*, being permanently geared to the smaller gear wheel, *o*. By means of a two-way clutch, *q*, either of the gear wheels, *o, p*, can be locked to the longitudinal shaft, *c*, causing the shaft to rotate at a speed depending on the ratios of the gearing. The longitudinal shaft, *c*, drives the axles, *u*, of the driving wheels, *v*, at both ends of the vehicle, reducing gear and reversing gear being provided in close proximity to the axles. The control of the vehicle is effected by means of levers on controlling pillars mounted at one or both ends of the vehicle. The reversing mechanism at each end of the vehicle comprises two bevel wheels, *19, 20*, loosely mounted on a countershaft, *21*, and engaging with opposite sides of the bevel wheel, *22*, at the end of the driving shaft. A clutch, *23*, is mounted on the countershaft, and causes the forward or backward movement of the vehicle by clutching the one or other of the two bevel wheels fast to the countershaft which drives the axle of the wheel through the reducing gear. August 3rd, 1905.

11871. 26th May, 1904. Improvements in and connected with Internal Combustion Engines. John Clay, 30, Hamilton Square, Birkenhead, and Somerville Goodall, 58, Shaftesbury Road, Birkdale. This invention has for its object an engine which is self-starting, reversible and controllable as to degree of energy or power, and is simple in its construction and mode of operating the parts. It is described as applied to an engine having three cylinders, with cranks at about 120 deg. from one another, and adapted to give a propelling stroke at each end of the cylinder, each revolution. The oil is forced into the ends of the cylinders or combustion chambers, mixing with the air therein, while the piston is returning and compressing. When the compression at each end is effected the charge is ignited by suitable igniters. There are eight figures. Fig. 1 is a side elevation partly in section. Each cylinder, 1, has connected with it two lift valves, 2, one at the top and the other at the bottom, the casings, 3, of which communicate by ports, 4, with the two ends of the cylinders on the opposite ends of the piston, 5; whilst at the centre of the cylinder there is an annular exhaust port, 6, communicating with it by a number of openings in the cylinder wall, and through which the exhaust of the gases at the ends of the strokes of the piston takes place in each direction. That is, the exhaust port, 6, is common to both ends of the cylinder, and the piston uncovers and closes it alternately at the opposite ends of its strokes in the well-known way. In connection with each cylinder there is a valve casing, 7, with a piston valve working in it, and communicating at its two ends with the valve casings, 3, below the valves, 2, by ports. This valve is for controlling the distribution of air supplied to the cylinder by an air pump. There is also connected to the cylinder a similar casing having a valve for controlling the flow of combustible mixture to the opposite ends of the cylinder, the mixture being supplied by a force pump. In their flow the air and the combustible mixture uplift the spring-

held valve, 2, which acts as a non-return valve to both, and cuts off communication between the interior of the cylinder and the valve ports. The combustible mixture is supplied by its pump, and is adapted to be admitted by its valve at a point when the piston, 5, is at about a half or three-fourths of its compressing or inward stroke, the mixture being forced in under a force of about 5 to 10 lbs.; 15, represents the air pump cylinder. 16 its piston, 17 the valve casing and 18 the distribution valve therein, and the air in this pump is forced up into the cylinder valve casing, 7, through the pipe, 19, which connects the pump valve casing and the valve casing, 7, together. The combustible mixture or fuel pump is of the same construction as the air pump; 22 is the distribution valve casing, which has an ordinary piston distributing valve. This valve casing, 22, and the cylinder valve casing at the centre are connected together by the supply pipe, 24, the supply to the valve casing, 22, from the mixture service being by a pipe, 26, on one end of the casing, 22, the mixture being supplied to the opposite ends of the casing, 22, through the valve itself which is hollow. A spring-pressed relief valve, 27, is provided on the supply pipe, 24, by which when pressure in the mixture pump exceeds that required escapes back by way of the by-pass branch, 28, into the inlet or suction pipe. The valves in the valve casing, 7, are operated from the ends of the projecting parts, 30, of the crosshead pin, which works the pump connecting rods, 32, and the two ends of the crosshead pin projections, 30, operate by connecting rods, 35, levers, 37, connected with the mixture valve and air valve spindle, 39. The reversing of the engine is effected by a valve placed on the side of the cylinder, and connected with the cylinder above and below the piston and also with the exhaust port belt, 6, of same. This valve is worked by an eccentric and link motion, the link being operated, that is, thrown over in one direction or the other or held in the centre by a suitable hand-operating lever. PASSING EVENTS.

A Ministry of Roads and Bridges.

WE have often said before, and we shall often, we fear, have occasion to say again, that one of the main requirements of future social and industrial progress in this country is a revolution in administration which will amount either literally or in effect to the creation of a ministry of roads and bridges, corresponding to the Ministry "des Ponts et Chaussées" of the French Republic, from whose management of affairs in many departments we have still in this country much to learn. The absurdities of the present chaotic regime—we cannot call it system—are simply unworthy of a civilised nation. The roads are the property of the nation at large, and one of its most valuable properties too, and

to surrender the management of them into the hands of innumerable independent local authorities whose maximum intelligence is as a rule that of the average farmer, and exceptionally that of the intelligent farmer, is a ludicrous method of mismanaging a national property. It is only now, when traffic is really beginning to come back to the roads in any real measure, thanks to the automobile movement, that people are beginning to realise the huge mistake that was made when in the early seventies the old turnpike system was abandoned. The turnpike system made the people who used the roads pay for them, and what was of more importance, as they made the construction of roads a thing from which private capital could obtain a return, promoted enterprise in that direction. It had serious disadvantages, no doubt, and could in no way suit present day conditions of traffic, but when it was abandoned it should have been abandoned in favour of a central administration and control, and not for the purpose of enabling the whole locomotion of the country to be dislocated by the wisdom of Gotham and Little-Peddy-in-the-Pound.

The imaginative picture which was drawn for the Munich Banquet menu in connection with the recent German Automobile week by Professor Herkomer, and which we reproduce this week, illustrates "The future bound to the automobile movement." The future *is* bound to the automobile movement, and the automobile movement is bound to the roads. No adequate progress will be possible till we have our roads controlled by a competent central authority, preferably a Government Department of the same standing as the Board of Trade and the Local Government Board—and the compeer of the Ministry "des Ponts et Chaussées." It certainly marks a step towards the realisation of this desirable end that a paper of the influence and standing of the *Daily Mail* should be devoting a series of well-informed articles to the subject, clinched by a leading article advocating the above solution.

Assisting the Joint Committee.

It will be a long time before all the points in which the automobile public can be of assistance to the Joint Committee, which is now arranging for the evidence to be placed before the Royal Commission, will be exhausted. We do not propose to make an extensive list of them, but to deal as occasion presents itself either with such matters as our readers may be in a position to furnish information about, or such as it may be well for them to bear in mind and fully consider.

One of the by no means less important considerations resulting from the oppressive manner in which the Acts have been administered is the effect on the automobile industry. The large number of summonses issued, the preposterous proportion of convictions to accusations, the practical certainty that every motorist summoned on the usual charges will be fined, and, above all, the high figure of the fines inflicted have had in many cases a decidedly deterrent effect in the case of people contemplating purchasing automobiles and becoming automobilists. The Joint Committee is most anxious to obtain statistics and information on this point, and we would recommend everyone, therefore—and there must be a considerable number of such people—who have for some time past considered whether they would become automobilists or not, and who have determined, at any rate, for the present, not to do so for the above reasons, to write to the Joint Committee stating that that is their

position, or giving instances of others whom they know to have been so deterred.

There are many cases also in which owners of cars have either practically given up driving or have sold their cars off and abandoned automobilism altogether for the same reason. Information of such cases would also be of the highest value. Nothing could be better calculated to impress the Royal Commission as regards the desirability of alterations in the law, and above all in its administration, than facts of this kind.

♦ ♦ ♦
Pay, Pay, Pay.

We have pointed out in the past other ways in which individual automobilists could be of the greatest assistance to the Joint Committee. We have now indicated two more. Both in drawing attention to our previous suggestions, however, and in the present instance, we would remind everyone that over and above assistance of that kind there is the even more important form of assistance consisting of contributing to the funds. The Committee *must* be adequately supported with funds for the campaign it has to carry out. A good beginning has been made, but it is a beginning only. Every automobilist should look upon the fund as an insurance fund against future annoyance, irritation, and police-court persecution, and, further, as a fund, the wise expenditure of which will ensure the satisfactory future development of the automobile movement.

The Light Delivery Van Trials.

As announced by us when going to press last week, the Light Delivery Van Trials arranged by the Automobile Club have again been postponed, this time till next year, the postponement being due to the small number of entries which had been received. It is to be hoped that the apparent disinclination of British manufacturers to enter for the trials will not be misinterpreted either here or abroad. To a large extent, no doubt, the smallness of the number who thought it worth while to announce themselves as competitors was due, as we observed last week, to the fact of the date for the trials being arranged so soon after the Tourist Trophy in the Isle of Man, and continuing to so near the Exhibition. But it is also to a large extent due to the circumstance that most of the manufacturers of commercial vehicles in the country are now devoting themselves to turning out motor 'buses, for which the demand is, at the present moment, largely in excess of the supply; and motor 'buses, or chassis suitable for motor 'buses, were excluded from the trials by the limitation of the competing vehicles to those designed for 30 cwt. loads. In fact, at the present juncture, the trade is not anxious for any such trials at all. So far, therefore, from the small number of entries this year being an unsatisfactory symptom, it is, on the contrary, an indication of thoroughly promising trade conditions. Any attempts to draw the conclusion, from comparison with the large number of competitors which took part in the recently held French commercial vehicle trials, that the English commercial industry is in an unsatisfactory state would, therefore, be wholly unwarranted.

It is to be hoped that the postponement till next year will enable the club authorities to some extent to reorganise the trials. It would, we think, be advisable to reconsider the restriction as regards the weight limit, so as to enable either motor 'buses, or chassis designed

with rubber tyres for motor 'bus purposes, to compete. The restriction was, we believe, imposed with an idea that the heavier vehicles would unduly injure the roads in the immediate neighbourhoods of the selected dépôts, but motor 'bus chassis, shod as they are with solid tyres, are not by any means destructive vehicles, so that there is no reason on that account for their exclusion. The date, too, must be arranged so as not to clash with other important events. If such modifications are made, there is every reason to believe that the number of entries will be thoroughly satisfactory, and we hope, too, that by next year even more will have been done in the way of building special vehicles of a light character for delivery van purposes.

A Matter for the Metropolitan Police.

ONE of the most jovial sights of the old days of horse 'bus enterprise in London, before the great companies settled down to a state of mutual amity, armed neutrality, or whatever else they may term the condition in which they now live with one another, was to see three 'buses coming along generally driving at a high rate of speed, if not actually racing with one another, and all carrying about three passengers each. Generally two of the 'buses belonged to some powerful company, and the third—the victim—was owned by some rival, and was being "nursed" off the road, by being as far as possible constantly kept in the middle between its two persecutors. What induced the police to wink at this sort of thing, as it generally meant furious driving on an elaborate scale, probably only the great 'bus companies themselves could tell. There now appears to be a possibility of a revival of this absurd method of omnibus rivalry in connection with the vehicles of the London Motor Omnibus Company, who are running the justly popular line of "Vanguard" motor 'buses. A mild reminder of how disastrous such proceedings could easily become in the case of motor 'buses is provided by the case of a motor 'bus which ran full tilt into a street refuge in Oxford Street recently. The honours between the refuge and the 'bus were fairly divided, as the refuge lost two iron posts and a lamp-post, and the front of the motor 'bus was badly damaged—not so badly, however, but that it could crawl home to its garage, while the passengers "escaped with a shaking," something of a fright, and a good deal of irritation. We do not for a moment believe that such tactics will succeed. But we call upon the Metropolitan police to stop even the semblance of "nursing" at once. Bad and dangerous as these were with horse 'buses, with motor 'buses they form an absolute menace to the public safety, which must not be tolerated for a moment—all the more so as under the Motor Car Act the police have ample power to stop it, since it involves driving to the danger of the public in the fullest sense of the term.

Impartiality.

MOTORISTS have often to complain of partiality in the treatment to which they are subjected in the British Islands. If they betake themselves to Switzerland, they will find that the most magnificent impartiality there reigns supreme—not to say rampant. There is one redeeming feature, the victims are not required to waste the greater part of a day in a more or less odoriferous police-court—they are simply fined on the spot by the policeman, gendarme, syndic, or whatever else he may happen to be, who is judge, jury, magistrate, prosecuting

solicitor, and material-witness-in-chief, all in one. You can even be fined as much as 30 francs in some places for going over 4 miles per hour. But the impartiality is the great thing! A recent traveller by motor, who made a canvass of his *confrères* at Lucerne could not discover a single one whom the authorities had forgotten to fine. This "fine" impartiality has, we understand, a most soothing effect. In this country, it is the uncertainty of the incidence of the police arrangements for accurately timing (!), summoning, and securing the conviction of motorists (the shorter word "trap" is no longer allowed), as well as the vindictive fines imposed, which prove so exasperating. The Swiss motorist knows that he will be fined regularly and fined often, though not fined much, and that there is no possibility of his best friend, who drives as fast or faster than he does, assuming an attitude of irritating superiority because *he* has never fallen a victim—and in that lies his consolation!

The Objectionable Exhaust Question.—Everyone having the interests of the automobile movement at heart must have recently recognised how important the elimination of smoky and objectionable exhaust from automobiles of all types is, particularly at the present juncture. The club and others have been to that end making reasonable suggestions to mitigate this undoubted nuisance—suggestions which probably without exception every true motorist will endeavour to live up to. It is therefore with a shock of very disagreeable surprise that we find an automobile contemporary giving publicity to a letter from an alleged member of the Automobile Club, making fun of the suggestions put forward by the Technical Committee for combating the nuisance, and embellished with several expressions of opinion which, to say the least, are in very questionable taste. Apropos of the club's proposal in regard to exhaust pipes, this "member" observes: "I guess that ninety-nine people out of every hundred will just leave their pipes sticking out where they are." Concerning the club's proposal to run motors in the garage before starting out so as to clarify the character of the exhaust, he ridicules the notion that "people who are in the habit of letting their motors send out clouds of smell are the sort of people who will take the trouble to run their engines during, perhaps, nearly fifteen minutes to avoid giving offence outside." Finally, this worthy "member" of the A.C.G.B.I. ends up as follows:—"I have no doubt that the T.C. of the A.C.G.B.I. will evolve more remedies in the fulness of time; or, if not, they might take turns and suspend themselves till the next Gordon-Bennett. In the meantime, let us thank them for their well-meant efforts." These are just the sort of sentiments that one would expect to be expressed by the type of "road hog," who has done so much to infuriate other road users against drivers of motor cars. Frankly, we disbelieve in the writer being a member of the Automobile Club at all. If he is, he should not continue to be so, but we should not be surprised to find that enquiry would prove that his assumption of membership is altogether unjustifiable, and that in private life he is one of the classes of driver who abuse their master's confidence by using their cars to tear along the roads to the danger and disgust of the public, while the employer supposes his property to be standing inoffensively at home. The letter is of the kind that should either have appeared over the signature of the writer, or not have appeared at all—preferably the latter.

CANALS AND MOTOR BOATING.

OUR CANALS.—One of the old locks near the Wesleyan Mission on the Basingstoke Canal, between Brookwood and Aldershot.

OUR CANALS.—A shady spot near Bisley on the Basingstoke Canal.

WE have always looked forward to seeing the canals and waterways of the United Kingdom, many of them, alas! derelict, utilised for motor boat tours or motor boat services, and now, as we pointed out last week, there seems a fair chance of one such experiment being made. The Basingstoke Canal has at last found a purchaser, and an up-to-date and go-ahead purchaser at that. For a long time this waterway, once the scene of considerable traffic, has been going from bad to worse. The company owning it got into liquidation, and what is almost if possible worse, into Chancery. The locks fell out of repair as the traffic diminished, and now in some of the reaches there is scarcely sufficient depth of water to float a boy's model yacht, and when, not very long ago, the canal, which includes a considerable amount of land on either side of it, was put up for auction at a reserve price of £20,000, not a single bid over that amount was obtained. It is a great pity. We remember when a

on between the Thames and Guildford. Proceeding for a couple of miles along the latter, a point is reached at which it is crossed by the London and South-Western main line, and here to the right between rows of beech, oak and pine diversified with gorse and bracken opens another waterway—the Basingstoke Canal. There are a few locks, and then a long stretch through fir woods varied by stretches of beech and birch, to the rapidly extending town of Woking. This stretch forms one of the most beautiful pieces of scenery in its way in any of the counties near London. The district through which the canal runs is necessarily flat, but the combination of woodland and water provides, as shown by the photographs which we reproduce, vistas of very distinct and particular charm. From Woodham to the other side of Woking, where the Brookwood Lock is encountered, is a long stretch without a single lock for about $3\frac{1}{2}$ miles, and then the locks come thick and fast again as the canal

OUR CANALS.—Two of the old Basingstoke Canal boats in ruins near the North Camp, Aldershot.

considerable and thriving traffic was carried on along this canal, not only by the time-honoured barges pulled by placid horses along the tow path, but many a time have we seen motor boats, in the days when the electric boat was in the ascendant, find their way up from the Thames.

It is no wonder that they did so, for a more beautiful waterway could hardly be imagined. Many of the habituaries of the Thames extend their tours up the Wey. After passing through the first lock where the Wey debouches into the Thames, they will find a double course open to them. One course (to the left) sweeps round under the wooded hills of Weybridge overlooking a wide expanse of alluvial meadow, while the other turns through a lock to the right. The former is the old Wey, the latter is the Wey Navigation Canal, along which traffic, sometimes to a considerable extent, is still carried

winds its way up past the county asylum, the celebrated crematorium, the Woking golf links, and the derelict prison, where Mrs. Maybrick was once incarcerated, to the table-land that runs from Aldershot to Basingstoke, which provides a magnificently varied stretch of woodland and wide-sweeping plain of over 20 miles in length, *with not a single lock.*

It is obvious that we have here what may prove the foundation not only of an admirable run for pleasure motor boats coming up from the Thames, but of a motor boat service which between Woking and Basingstoke might prove of the greatest possible value to the inhabitants, who at many points along the canal are very far removed from railway facilities, and would welcome a motor boat service capable of providing facilities for communication and goods traffic.

(To be continued.)

THE 40-50-H.P. RICHARD-BRASIER CAR.—PART II.

The Main-Clutch.

As already stated, the clutch is unlike that on any other well-known type of vehicle, although at first sight its main peculiarity is not necessarily evident. A good view of it is obtained in Fig. 4, which shows the central portion of the chassis from behind, and in this illustration the clutch is seen to resemble others of the leather-faced cone type. The inner member is—as on some other vehicles—carried on the projecting end of the crank-shaft, and the spring which brings it into engagement with the outer member is contained inside the boss, so that no end-thrust is imposed on the shaft when the clutch is in use. The sliding sleeve, by which the clutch-cone is withdrawn when the pedal is depressed, has, however, an unusually long range of travel, and is normally pressed forward by a weak spring (D), which is mounted about the pedal rock-shaft for this purpose. The sleeve is provided with six forwardly projecting pins, which pass through holes in the boss of the clutch-cone, and also engage—when the sleeve is moved to the end of its range forward—with similar holes in the flywheel member of the clutch.

A very light pressure of the foot on the clutch pedal is sufficient to overcome the action of the weak spring, D, and, therefore, to prevent the pins from locking the two members of the clutch rigidly together. The device enables the driver, however, to prevent any slip from taking place when the car has once settled down into steady running, since it is then only necessary for him to release the pressure of his foot entirely, and the pins slide forward into place like a jaw-clutch. The clutch, otherwise, operates in exactly the usual way, and although care must obviously be taken at first until one becomes accustomed to the arrangement, yet there is apparently little risk of much harm being done by liberating the pedal too suddenly, since the pins would be unable to enter the holes in the "driving" member if the relative speeds of the two parts were unduly high.

The clutch-fork is provided with small rollers for reducing the friction between it and the sliding sleeve that it controls, and these rollers are themselves mounted

on ball-bearings. Provision is also made for adjusting the position of the clutch-pedal to suit any individual driver.

Of very substantial construction—as seen in Fig. 4—are the universal joints that are fitted at each end of the shaft connecting the clutch with the gear-box. Their pins are not only of large size, in order to ensure large bearing surfaces, but are hollowed out for lightness and to retain a good supply of lubricating oil. In all cases the bearings are formed by easily removable bushes, which can therefore be replaced when they become worn, and it will be recognised in our illustration that the forward universal joint has a "cardan" form of outer member to allow for any longitudinal play of the shaft.

The Engine.

In the main, the design of the 40-50-h.p. engine (see Figs. 5 and 6) is the same as that of the smaller standard 4-cylinder models—the 12-16, 16-20, and 24-30—made by the same firm, the cylinders being cast in pairs, with the exhaust-valves on the left and the inlet-valves with the igniters on the right side. Above the valves, and also placed centrally above each cylinder, are interchangeable inspection-plugs, for which the special tool, A (seen lying on the frame in Fig. 4), is provided. Both the cam-shafts, with their gear-wheels, are enclosed in the crank-chamber, the main body of which is formed by a single casting, to which the detachable portions above the cam-shafts are bolted at an angle. Also enclosed in the casing is the centrifugal governor—on the front end of the inlet-valve and igniter cam-shaft—which is connected by the bell-crank lever,

B², and the rod, B³, with the throttle-valve in the carburettor. It is this governor, in conjunction with the hand-lever, B, on the steering-wheel, and the small pedal, B¹, that gives the *sole* control of the engine under ordinary running conditions. The lever, B, and the pedal, B¹, are both connected with the bell-crank lever, B², by the spiral springs visible in Fig. 5.

Quite a feature of the engine is the mechanism for facilitating starting, to which brief reference has already been made. Beneath the radiator—conveniently near the starting-handle—is a hand-lever, which performs

Fig. 4.—The central portion of the 40-50-h.p. Richard-Brasier Chassis, as seen from the rear.

Fig. 5.—The 40-50-h.p. Richard-Brasier Engine, fixed in place in the chassis; view from the right side.

three distinct functions simultaneously. It inserts the key that connects the handle with the crank-shaft, it retards the time of ignition, and it reduces the compression in the cylinders. It is for the second purpose that the rods, C', are led to the igniters, where they affect the "trip" mechanism by rocking a cam about its axis, as on previous Richard-Brasier cars, and it is for the third-mentioned purpose that the rock-shaft, E'—seen in Fig. 6—is fitted. The rock-shaft, E', which is normally stationary, carries forked levers that lie beneath each of the exhaust valves, and is so arranged in connection with an external cam on the rear-end of the cam-shaft that this cam can be made to rock it about its axis when the lever, E, is moved into its "starting" position. The cam has four projections, and, therefore, tends to lift all four exhaust valves during the first part of each stroke. A spring is introduced between the rock-shaft, E', and the cam to allow either valve to close when an explosion occurs in its cylinder. The compression is thus reduced in all four cylinders until the engine has got properly under way, and all risk of "back-firing" is automatically prevented.

The igniters, for which the current is supplied by a low-tension magneto, on

the opposite side of the engine, are made in two separate parts, the portion carrying the rocking member being bolted to the side of the combustion chamber, and the insulated contact-pillar being fitted in from above the head. The current can be cut off for stopping the engine immediately at any time by the switch, C, on the steering wheel, the switch short-circuiting the magneto. Contact is made as usual with each igniter by a chopper-switch of simple design.

A pump is used for circulating the cooling-water, but no fan is employed for drawing air through the radiator. This is, therefore, a departure from the practice adopted on the other Richard-Brasier touring cars, for which natural circulation on the thermo-syphon system is made to replace a pump, and a belt-driven fan is provided. The pump on the new chassis lies beneath the crank-shaft in front of the crank-chamber, where it is driven by spur-wheels; it is of the gear-wheel type.

As usual on this make of car, the excellent practice of marking off on the rim of the flywheel the proper positions for "setting" each valve and each igniter is retained.

(To be concluded.)

Fig. 6.—View of the 40-50-h.p. Richard-Brasier Engine, as seen from the "near" side of the chassis.

SOME time ago Mr. Hoyle, a motor car dealer of Brighouse, was convicted by the Bradford West Riding magistrates on a charge of driving a motor car at Shipley without having a rear light. As our readers will recollect, a Bradford City magistrate of the name of Mr. Henry Illingworth subsequently wrote to point out that he himself was in all probability the real delinquent, and it was clear that the police had made a mistake. The case was brought before the Home Secretary, and he has ordered Mr. Hoyle's fine to be remitted. Considering

the amount of trouble and annoyance Mr. Hoyle has been put to, this is an obviously quite inadequate compensation for such a miscarriage of justice, while what is the worse consequence of such a conviction, the endorsement on his licence still remains. We fear, however, that the only way for Mr. Hoyle to get that removed, if the justices who misconvicted him have not the common justice to order its removal, is to appeal to Quarter Sessions—needless to say, a somewhat expensive proceeding.

THE CHELMSFORD DOUBLE-DECK OMNIBUS.

THE first of the large steam omnibuses built by Messrs.

Clark
super-
condens-
water-
exhaust-
motor-
this
the

mounted on a neat instrument board that slopes forward from the footboard, as seen in our illustrations.

Although of very large size, the condenser is arranged so as to be unobtrusive, practically constituting, as it does, the front of the "bonnet." All the special "Clarkson" features are retained in the engine—the forced oil-feed to all parts, the floating piston-rings, the glandless stuffing-boxes, and the "Joy" valve-gear — and the same type of pumps as

The "Chelmsford" Double-Deck Omnibus Chassis. View from the "Off" Side.

flash type of steam generator, a down-flue —instead of a chimney —for leading off the fumes from the burner, and a fan to draw air through the condenser.

An extremely good general idea of this chassis is given by the four accompanying photographs, which show it from both sides, from the front and from behind, respectively. In this case, one engine alone is needed, and its cylinders project forward from the combined casing that forms the crank-chamber and the housing for the differential countershaft.

Front and Rear Views of the "Clarkson" Double-Deck "Bus Chassis.

The steam generator is placed beneath the raised

vehicles, the fuel used is there are no objectionable. The power available is considerably in excess of actual requirements, so that any hills met with in the London district can be mounted at full speed. Substantial construction, first-class workmanship, and careful attention to all such details as render self-propelled vehicles both durable and easy to manage, are some of the more important characteristics of these British-built machines.

AERONAUTICS.

M. SANTOS DUMONT has been projecting his imagination into the future and, not long ago, contributing to the pages of a London magazine an interesting forecast of the aerial navigation of time to come. The article has been imaginatively illustrated, and some of the pictures present a striking resemblance to the illustrations which added to the attractiveness of Mr. H. G. Wells' "When the Sleeper Wakes." In fact, one cannot help thinking that M. Dumont's prophesying owes something to that wonderful exercise in constructive imagination. Certainly his illustrator does, and it is not without its significance that M. Dumont, one of the pioneers of the navigable balloon, is convinced that the ultimate solution of the flight problem will go to the disciples of the heavier than air principle. In the meantime M. Dumont is still going on with the designs of a huge navigable balloon, so he says, which is to have a capacity of 77,000 cubic metres of gas and an ascensional force of 93 tons. There is nothing, he tells us, fantastical in this. It will be 200 metres long and 28 metres in diameter, that is to say, if the stomach of the gas-vessel was reposing on the ground its back would be level with the top of a moderate-sized factory chimney. It is to have thirty propellers, each of them driven by a 100-h.p. petrol motor, and the gas vessel is to be made of twenty-six thicknesses of Lyons silk, regularly laid over one another and varnished. Thus the great airship will be driven forward some time or other by 3,000 h.p. and ought, M. Dumont informs us, to attain a speed of 60 miles an hour or more. Such an airship should be capable, he thinks, of carrying enough fuel to take it 4,000 kiloms. at reduced speed, and 1,000 kiloms., say twice the length of the Gordon-Bennett Race, at full speed.

M. Dumont lets his imagination rather run riot with a number of little refinements which the sceptic may be excused for looking upon as somewhat premature, as he is going to have a regular closed-in dwelling room with sleeping compartments, and while he is asleep his guests will look after the stability of the airship. "We shall dine. We shall watch the heavens become star-studded. We shall remain suspended between stars and earth. We shall awake in the glory of the morning. And days will follow days. We shall cross frontiers. Now we are soaring over Russia—it would be a pity to stop so soon—we make a loop, and return by way of Hungary and Austria. Here is Vienna! Start the propellers and change the direction—who knows we may not find a current which will carry us to Belgrade? But the morning has come again; we travel with the breeze to Constantinople! We have the time, and we shall always find the means of returning to Paris." Those words, "We shall dine," are really a master stroke, and show that M. Dumont has not resided in Paris for nothing. After giving free rein to his imagination in this way, M. Dumont sees, just like Mr. Wells, landing stages rising high above the general level of Paris, and then the day of the aeroplane will be near. In any case, M. Dumont has many of the qualities of a great writer—pre-eminent amongst them, needless to say, being imagination. And he has an eye for analogies. It is the first step in mechanical flight that he recognises as the most difficult, and he sums up his views in this pregnant passage: "The clumsy eagle! The other

day, at the Jardin des Plants, I was watching the strokes of its wings on a branch in its cage. As its clumsiness became more and more apparent, I congratulated, in secrecy, its Inventor and Maker, in that He did not have, to advise Him, when He commenced His first experiments, mathematicians in frock coats and high hats. Awkwardness and heaviness would have caused them to condemn in advance the eagles, just as awkwardness and lightness caused to be condemned the first steerable balloons." M. Dumont can hardly say much more about the future on the subject, and we would remind him, in the words of the Merry Andrew in "Faust":—

Der Worte sind genug gewechselt
Lasst uns nun einmal Thaten sehen!

For it is after all a good long time since he was last in the air.

M. SANTOS DUMONT perhaps recognises this aspect of the situation, and he is accordingly, we understand, bringing towards completion his new racing airship, as he calls it, of which the gas vessel is now complete. It will be 41 metres in length, and contain, when fully inflated, 190 cubic metres of hydrogen. It will be propelled by a 14-h.p. Peugeot motor weighing 27 kilogs., which has already been tested and worked excellently. The gas vessel of the new airship is very much more pointed than those of its predecessors, and we daily await news of successful experiments with it.

SINCE writing the above description this machine has been completed, and M. Santos Dumont has been flying about in it before, or rather above, admiring crowds (as usual) on the beach at Trouville. There he has been describing all kinds of figures in the air, sometimes over the land and sometimes over the sea, and sometimes coming down almost in the middle of the spectators on the beach. The new airship displays considerable capacity for proceeding against the wind, and, altogether, the preliminary trials made with it at Trouville are most encouraging.

ALMOST contemporaneously an account comes from New York that Mr. Knabenshue, who, it will be remembered, made successful ascents with an airship at St. Louis, has been carrying out some evolutions over New York City, starting from Central Park, proceeding to Broadway and Forty-Second Street, and after circling about in the air, returning to Central Park. It is the first flight of an airship over the Metropolis of the U.S.A., and has occasioned considerable excitement, though critics who have seen it, notably Professor Briggs, are disposed to somewhat belittle the performance, comparing it with the drift over London executed some time back from the Crystal Palace. It would seem, however, that Knabenshue was really successful in going against a wind of some degree of power.

MR. EDGAR WILSON, whose adventures with his alleged flying machine, at Wembley Park, we chronicled last week, is not discouraged, but declares (in the daily papers) that he has continued daily trials *in privacy* over the lake, and on Wednesday in last week launched the "airship" off the high Watkin tower. He is now proceeding to equip the "airship" with a 6-h.p. petrol motor for flapping its wings.

MR. MARINAKIS, a Greek subject, is stated to have invented an airship in which the War Office is said to be taking such an interest that they have appointed a committee of officers of the Royal Engineers to inspect the working model as soon as it is completed. The inventor appears to be of opinion that he will be quite successful in inducing his airship to proceed against the wind.

THE airship of Count Almerico da Schio has been repaired, and the experiments with it continued, under the supervision of Sig. Hector Cianetti. The airship has been up in the air, and has made several satisfactory evolutions, demonstrating its manœuvrability. It is constructed, as our readers will remember, on what may be called Santos-Dumont lines, with a compensating ballonette inside the gas-vessel, and a hull constructed of tubes and steel wire, the motive power being provided by a 12-h.p. Buchet motor and a Tatin propeller, which is 4½ metres in diameter, and revolves at 300 revs. per min. The airship is said to have attained a speed of 30 kiloms. per hour.

FURTHER experiments were carried out a short time ago on the Seine with the more recent type of Archdeacon aeroplane, that in which, as we have already pointed out, the machine is duplicated, forming to all intents and purposes a huge multi-cellular kite. As in previous experiments, the aeroplane was mounted on floats which permitted of its maintaining itself on the surface of the water, and a speed was imparted to it for the purpose of raising it in the air by a cable attached to a high speed

A Travelling Workshop.—It is in accord with the true spirit of automobilism that if the cars cannot go to the workshop the workshop should go to the car. The faith of Mahomet may have failed to move the mountain,

motor boat, L'Antoinette II. The experiments took place in the neighbourhood of Billancourt. As soon as the motor boat got up speed the aeroplane left the surface of the water and soared along towed by its rope for a distance of some 60 metres, at a few metres above the surface. It was manned by M. Voisin, as on previous occasions, and when, after some experimenting, it got a little out of adjustment, it took a dive beneath the surface of the water, M. Voisin was with difficulty extricated. Similar experiments were made with the aeroplane of M. Eleriot, a construction substantially the same as that of M. Voisin, but of smaller dimensions. Altogether the experiments do not appear to have shown very much, for no one entertained any doubt that if properly guided an aeroplane of this kind would rise if towed by a rope, and carry a man with it, just as an ordinary kite does.

THE Montgomery aeroplane, the successful experiments with which we described a little time ago, when repeating its previous demonstration in California, in which it was carried up to its usual altitude of some 3,000 feet, experienced a tragic accident, owing, it is believed, to the guide ropes of one part of the wings becoming entangled. The aeroplane was cut loose from the lifting balloon as before, and the aeronaut, Mr. Maloney, manipulated it for some short time, apparently with his customary control. All of a sudden, however, it was observed to dive earthwards, and the aeronaut was unable to regain control of its equilibrium, the result being that it crashed to the ground, killing the unfortunate Maloney and badly damaging the machine.

to do is to drop a postcard to the head office of the firm in Regent Street, and the caravan will set forth to attend to his wants. There is very little doubt that Mr. Harvey du Cros will find his idea extremely popular; already the users of Panhard cars are legion, and as the advantages of being able to summon expert help in this way will offer a strong inducement to would-be purchasers, the travelling-workshop, as an institution, is not likely to remain for long with this as a solitary example.

MESSRS. PANHARD'S MOTOR WORKSHOP.— View of the complete vehicle.

but some allowance must be made for the fact that he lived in days when automobiles were unknown. Nowadays it is more than probable that some enterprising syndicate would be formed to endeavour to comply with the prophet's desire. At any rate, the happy possessor of Panhard cars is now in the enviable position of being able to summon to his aid a veritable road "Vulcan," and a competent staff of mechanics as well, which, with characteristic enterprise, Mr. Harvey du Cros has devised for their convenience. All that the motorist has

Herkomer Trophy.—Last week we published, in tabular form, the results of the speed-trials which took place on the Kesselberg Hill and in Fürstenrieder Park; we are now able to give, in a similar manner, the official results of the whole competition in which these two events were embodied. The same system of "marking" in "minutes and seconds" has been adopted, and, as if this were not sufficiently confusing, an elaborate juggling takes place in order to get at the final result on which the Herkomer Trophy itself was awarded.

There are, as is obvious from our table, three headings under which marks have been allotted, viz :—Appearance, speed, and reliability. Of these, the marks given for speed include those for the Kesselberg Hill Climb and the flat race in the park, as published in our columns last week. The appearance and reliability marks have been allotted in the manner explained by us in our issue of August 19th. A maximum of 36 marks was given for appearance, and a minimum of 36 marks for reliability, this curious system entailing the winner of each event having the highest marks in one case and the lowest in the other. In the speed contest, the winner was

The judges' tent at the Fürstenrieder Park Races.

The official tent on the Kesselberg.

HERKOMER TROPHY.

HERKOMER TROPHY.—The cars on exhibition in Beissbarth's Auto Hall.

also denoted by the least marks. To reduce this chaos to order of merit is no mean task, and we notice that the formula for this, as published by us last week, is not quite the same as that on which the "total marks" given in the official table were finally based, which is:—Total = Reliability + Speed — Appearance. Combined with the peculiar system of time units which have been adopted as "marks," the whole effect is unquestionably confusing, and we cannot help thinking that a simpler scheme could have been used which would have given equally good results in a more intelligible manner.

Notwithstanding the evident reliability of the five Daimler cars, and their phenomenal successes in the speed contests, they unfortunately failed to secure places in the final classification, entirely owing to the sequence of tyre troubles which marred the progress of their tour.

This is all the more regrettable as these cars created quite a sensation wherever they went, and there is no doubt that the Daimler caravan has done much to enhance British reputation, both for sport and manufacture.

Several of the competitors who were not placed, received a silver medal and honourable mention for going through the reliability tour without being penalised by marks. Among these were G. Dawson, 35-h.p. Daimler; Argus Company, 20-h.p. Argus; G. Beissbarth, 30-h.p. Peugeot; G. Achenbach, 24-h.p. Achenbach; H. Lucke, 24-h.p. Scheibler; Horch and Co., 18-h.p. Horch; Frhr. v. Moliton, 16-h.p. Metallurgique; Dr. Haberland, 16-h.p. Opel; L. Sprung, 16-h.p. Peugeot; B. Branda, 15-h.p. Opel.

Herr F. Kösel, who drove a 28-h.p. Benz unofficially, is classified in the official results between the third and fourth places as "3A."

HERKOMER TROPHY.—Arrival of the cars in Munich after the three days' touring trip to Baden-Baden and Nürnberg.

cars, with points of 14,438, the Brouhot house securing this prize with 14,973 points.

The principal results by category are as follows. Except where stated, the cars are open:—

Category 1.—Open Cars of total value of 5,000 frs. and under. Closed Cars up to 6,000 frs.

1. 8-h.p. De Dion Bouton* (Bardin), 4,680 points. 2. 8-h.p. Fouillaron† (Grillet), 4,553. 3. 8-h.p. Cottereau* (Chalas), 4,250.

Cat. 2.—Open Cars up to 8,000 frs. Closed 9,000 frs.

1. 10-h.p. De Dion* (Didier), 5,038. 2. 12-h.p. Gladiator* (Hervillard), 4,363. 3. 10-h.p. De Dion* (Laporte), 4,297.

Cat. 3.—Open cars, 8 to 12,000 frs. Closed, 9 to 15,000 frs.

1. 15-h.p. Brouhot‡ (Belleville), 5,242. 2. 15-h.p. Brouhot‡ (Marechal), 4,842. 3. 20-24-h.p. Darracq† (Coujet), 4,784.

Cat. 4.—Open cars 12 to 18,000 frs. Closed, 13 to 19,500 frs.

1. 16-22-h.p. Berliet‡ (Ballot), 5,028. 2. 24-h.p. Brouhot‡ (Feuillot), 4,889. 3. 24-h.p. De Dion* (Cormier), 4,720.

Cat. 5.—Open cars 18 to 24,000 frs. Closed, 19,500 to 26,000 frs.

1. 40-h.p. Brouhot‡ (Richez), 4,944. 2. 24-h.p. Rochet-Schneider‡ (De Sambrecy), 4,759. 3. 30-h.p. Ariest† (Baron Petiet), 4,713. 4. 24-h.p. Rochet-Schneider‡ (closed), 4,532.

Cat. 6.—Open cars over 24,000 frs. Closed over 25,000 frs.

1. 40-h.p. De Dietrich† (Sorel), 5,356. 2. 60-h.p. Mercedes‡ (Bary), 4,407. 3. 60-h.p. Mercedes* (Baron H. de Rothschild), 4,267. 4. 24-h.p. Gladiator* (Mercy), 3,851.

In the class for regularity for teams of three, the winning cars were:—1. Brouhot, 14,973 points. 2. De Dion, 14,438, and Peugeot, 12,283.

Tyres:—* Dunlop. † Michelin. ‡ Continental.

HERKOMER TROPHY.—The Grand Duke Cyril of Russia is amused during the Kesselberg Climb.

Pyrenees Cup.—Of the sixty starters from Toulouse on August 20th, no less than fifty-five not only "got through," but they arrived back at Toulouse on August 27th in excellent time and splendid condition, after covering the 1,385 kilometres of almost continuous climbing and descending hills, in many cases of exceptionally severe gradients. The competitors received a big ovation upon their re-entry into Toulouse, and the whole run has probably proved one of the most important long distance contests carried through recently in France. The factors taken into consideration in arriving at the awards include hill climbing, power, brake efficiency, comfort in riding, average speed combined with regularity, speed on the flat, condition of the cars after the trial, fuel consumption per ton kilometre, &c.

Considering the distance and the nature of the route through the Pyrenees the absence of any bad accident, except the one due to carelessness recorded by us last week, is a matter for considerable congratulation to the organisers, and all those who took part in the event.

Sorel on a 40-h.p. De Dietrich car using Michelin-Samson tyres, has been adjudged the winner of the Pyrenees Cup, with 5,356 points, Belleville on a 15-h.p. Brouhot taking second place in the general classification with 5,242 points, and Didier on a 10-h.p. De Dion car securing the third place with 5,038 points. The actual best average speed is unofficially attributed to Bary on a 60-h.p. Mercedes shod with Continental tyres. In addition to the third place in the general classing, the De Dion house secure by category the 1st place in Cats. 1 and 2, the 3rd place in Cat. 4, and the 2nd place for regularity of running with their team of three

Australian Reliability Trial.—The very successful reliability trial organised last February by the Dunlop Tyre Company, of Australia, is to be repeated from November 14th to 18th next, and is thereafter to become an annual fixture in November each year. The February run was from Sydney to Melbourne. Upon this occasion the route will be reversed, and the competition start from Melbourne and finish at Sydney. The rules are practically the same as those which governed the first contest, minimum and maximum time limits being enforced for each stage of the run, these times varying according to the classes. The five days' run will be: November 14th, Melbourne to Euroa (100 miles); 15th to Albury (101 miles); 16th to Gundagai (121 miles); 17th to Goulburn (121 miles); 18th to Sydney (129

HERKOMER TROPHY.—Another view of the Mathis "palace" travelling car. Note the bath, &c., on the roof.

the district was afflicted, and the results of which are illustrated in some of the photographs we reproduce, had carried away a great part of the road surface. It took twenty men to clear the foot of the hill sufficiently to allow the cars to pass, and part of the road where the water was still running had to be filled with stones, brushwood, and gorse, with cottage doors placed on the top, to enable the vehicles to get up at all.

Results:— Class A.—(Up to £200).

1. H. Green (8-10-h.p. Rover), 2m. 1s.
2. Mrs. Mecredy (8-10-h.p. Rover), 2m. 14½s.
3. Sir V. Grace (8-h.p. De Dion), 3m. 11½s.

Class B.—(£200 to £400).

1. J. P. A. Colley (10-h.p. Argyll), 2m. 15½s.
2. J. M. Close (10-h.p. Peugeot), 2m. 16½s.
3. M. Stewart (10-h.p. Argyll), 2m. 25s.
4. D. Jamieson (8-10-h.p. Humber), 2m. 41½s.
5. G. T. Robinson (9-h.p. Talbot), 2m. 43½s.

Class C.—(£400 to £600).

1. G. T. Robinson (12-h.p. Talbot), 1m. 51s.
2. A. Rawlinson (15-h.p. Darracq), 1m. 59½s.
3. W. R. McTaggart (12-h.p. Argyll), 2m. 8½s.

2. A. Rawlinson (70-h.p. Darracq), 1m. 11s.

100 Miles Speed-Judging Contest.—Under the auspices of the Hull A.C., a trial of driving within specified speed limits over a distance of 103 miles was carried out last week. Two classes were created, one for cars and forecars, and one for motor cycles, cups being offered by Colonel Harrison-Broadley and Mr. C. J. Naylor for the two classes respectively. The speeds fixed were, for cars, 13 to 17 m.p.h., and for

Photograph by Ralph Mecredy.

IRISH HILL-CLIMB.—Road en route to the selected hill, washed away by the floods. Cars had to return and proceed by a circuitous route to the scene of the contest.

miles). A separate contest over the same route is arranged for motor cycles, which are also allowed specific times for the run. It is to be hoped that British manufacturers will see that their cars take part in this reliability run, as a very large amount of business is springing up in Australasia, and no better method could be conceived of capturing this field for motor cars than by successfully demonstrating to the Australian public the suitability of particular makes of British cars for the requirements of colonists. The Continental and American manufacturers fully appreciate the importance of this run, and we understand are arranging for a considerable show of cars in the contest. Mr. C. Proctor, at 108, Flinders Street, Melbourne, has the whole matter in hand, and without doubt a similar success awaits this trial to the one which Mr. Proctor did so much to promote successfully last February.

An Irish Hill-Climb.—Owing to the destructive storm of Friday the members of the Irish Automobile Club were compelled to change the venue selected. Never—not even when the bolt fell from the blue that put a stop to the Dashwood Hill competitions—was a hill-climb ever carried out in the teeth of such terrific obstacles. It was originally intended to hold the event on Ballynaslaughter Hill, outside Newtown, Mount Kennedy, co. Wicklow, but the effect of the incessant downpour cut up the road to such an extent that such was impossible. However, an equally good hill on the other side (Callow Hill) was selected, and the annual open competition took place. Even on this hill, the fearful downpour of rain with which

THE TOURIST TROPHY—(continued).

To facilitate reference to the various specific points raised in our article, and referred to by our correspondents, we reproduce the summary of the chief suggestions put forward by us, as also the list of the weights, measures and dimensions that are specified by the rules for this year's race.

Suggested Modifications of Rules for Future Years.

- (1) The bodies to be comprised of four independent parts.
- (2) No cars to have engines with less than two cylinders.
- (3) No cars to have more than four forward "speeds."
- (4) Any obvious "freaks" may be refused entry at discretion.
- (5) Any unduly noisy car may be disqualified at discretion.
- (6) The race to extend over two, or three, consecutive days.
- (7) The cars to start, at equal time-intervals, in order of numbers.
- (8) The cars to be stopped, timed, and re-started immediately, at numerous "controls."
- (9) The cars to carry numbers denoting laps completed.
- (10) The cars to be driven by different drivers each day.
- (11) A class to be instituted for two-seated cars, to compete separately, and on other days.

VIEWS AND OPINIONS

Mr. F. S. Bennett:—

I have read with great interest your article on the Tourist Trophy, and beg to compliment you on the comprehensive manner in which it has been dealt with. In fact, it is so comprehensive that there is little left to be said beyond giving an opinion regarding the "Suggested Modifications of Rules."

Of course, the main idea is to develop the "Ideal Touring Car," and then the question arises, what is an ideal touring car? Remember that "some like apples and some onions." The main point from a manufacturer's and agent's point of view is—is it going to teach us something that we do not learn from the experience of our daily business? The writer is inclined to think that we shall learn something from an event of this sort, but it will be at considerable expense. There are over 50 entries, and there is to be only one winner, consequently it is over 50 to 1 chances against winning.

Of course, the real value to a manufacturer or agent depends on how well the event is reported in the papers, and to enable the Press to do justice to each car, it is of vital importance that the club should furnish it with an elaborate and extensive amount of information.

What I mean by this is that the performance of *each* car should be tabulated and published so that the whole credit and advantage does not go to the winner. I presume that it may be taken for granted that this will be done, but we cannot be too persistent in urging the necessity of it, as it is only natural that the winner gets great credit, whilst the rest are neglected.

Referring to your suggestions:—

1. I do not agree with the principle of dividing the bodies into four independent parts. The idea should be, as far as possible, to use standard types of bodies, and not those which are verging on being freakish.

2. This is a matter with which I most emphatically disagree. Being one of the champions of the single-cylinder principle in this country, I certainly do not see why the single-cylinder should be debarred. After all, is not a single-cylinder the ideal type as regards simplicity? You must admit that the last year or two have done much towards the development of the single-cylinder car. There are single-cylinder cars now on the market which, when once they have picked up their speed, run so smoothly that they cannot be beaten by four cylinders in this respect. In any case, it is only fair that all classes and types should be allowed to enter, and show what they can do.

3. More than four speeds forward with the type of gears at present mostly used on cars might fairly be called freaks.

4 and 5. These are good suggestions, and, I think, might be carried out with advantage.

6. I quite agree that the race should, if possible, be extended over one day. Three days, if possible. An event of this sort should be kept in front of the public for as long a time as is practicable, in order that the advertisement should be greater, for, after all, is not this the main idea that the manufacturers have in view when going to the expense of entering for an event of this description? Of course, it is probable that the authorities would not grant permission for more than one day, as the Isle of Man season would not be over.

7, 8, and 9. It is most important that the spectators should have information regarding the progress of the race and the positions of the respective cars. Any system that may be adopted would be beneficial if this information could be successfully made known to

Specified Weights, Measures, and Dimensions in the Existing Tourist Trophy Rules for this Year.

- (A) *Fuel Consumption*—1 gall. per 25 miles (dry, average road).
- (B) *Weight of Body and Load*—950 lbs. (including 300 lbs. ballast and 22 stone passengers).
- (C) *Weight of Chassis*.—Between 1,300 lbs. and 1,600 lbs.
- (D) *Wheel-Base*.—Not less than 7 ft. 6 ins.
- (E) *Track*.—Not less than 4 ft.
- (F) *Platform behind Dash*.—Not less than 6 ft. 6 ins. long and 2 ft. 6 ins. wide.
- (G) *Width of Seats* (each pair).—Not less than 3 ft. 4 ins. (between cushions).
- (H) *Height of Seats* (from ground).—Not less than 2 ft. 10 ins.

OF OUR READERS.—VI.

the public during the race. This matter is of great importance, and I trust it will be well looked after.

10. I do not agree that there is much advantage in changing drivers each day. What we want to get at is the best that can be obtained from a car under the best conditions.

Some of the rules are certainly open to criticism, but it is probably too late now to get them altered, so we must be content to gain our experience for this year's race under the present rules and modify them next year, when we shall, I trust, all be wiser for the experience gained this year.

F. S. Bennett

Captain B. D. Corbet:—

Although I fully appreciate the many undoubted merits of such an event as the proposed Tourist Trophy Race, and also the manner in which THE AUTOMOTOR JOURNAL has taken up this matter in its columns, yet this year's race entirely fails to appeal to me, and must do so, I believe, to all those who, like myself, are interested in the most successful types of touring car of to-day. The weight limits must by the existing rules preclude any such cars from taking part, and I think it is obvious that some freak, built specially for the purpose, stands the best chance of success this year. It is to be hoped, therefore, that another year the club will organise the event in such a way that the makers of more substantial and really useful vehicles can associate themselves with it. Doubtless, however, much valuable information will be obtained from the forthcoming event concerning the relative advantages of the underlying principle of the T. T. competition, and unquestionably your article will have served a useful purpose in familiarising your readers with the many points involved.

B. D. Corbet

Mr. T. Blackwood Murray:—

I have read with great interest your very able article on the Tourist Trophy Competition.

While this competition will no doubt form a very interesting annual event, I cannot see that it will do much to further or hasten the development of the really practical motor car for every day use. This, I think, will only be brought to its final state of perfection by a gradual process of evolution based on the results of many years' road experience and the requirements of the public.

Past experience has proved that in whatever direction limitations are imposed by competition rules, they invariably lead to the production of abnormalities in design, whereby competitors hope to score an advantage. Such abnormalities are almost inevitably outside the pale of sound engineering design.

I believe the Tourist Trophy Competition will result in the production of very efficient highly specialised cars, requiring really expert drivers to get anything like the best results out of them,

whereas what is really wanted for the general market is simple, strong, reliable cars, as automatic in their functions as possible, which can be handled without expert knowledge, and capable of being driven thousands of miles without necessitating repairs or adjustments.

To prove my contention, I might take as an instance the function of ignition advance. This most important function can be automatically carried out by comparatively simple means, and with excellent results and good efficiency, thus giving the driver one lever less to attend to, still there is no gainsaying the fact that probably a really expert driver could get still better efficiency with a hand-controlled ignition advance. Obviously, therefore, the latter would be fitted to a car intended for the Tourist Trophy Competition, whereas the former device would be an infinitely preferable and more satisfactory arrangement for the general market.

Again, it is reliability, and not speed, that 95 per cent. of the purchasing public is now looking for, and to determine reliability I do not think that any competition of much less than 8,000 to 10,000 miles would be of real value in determining the absolute relative reliability of various cars, and to eliminate the question of luck, there ought to be at least three or four cars of each type entered in the trial. The expense of carrying out such a trial would, of course, be prohibitive.

I think it is extremely doubtful whether it is at all advisable for the club to hold anything of the nature of races or speed trials in the meantime, in view of the very strong public feeling against excessive speed, and of the forthcoming reconsideration of the 1903 Act; on the contrary, every effort should be made by the club to discountenance excessive speeds.

I do not think it would be advisable to have the bodies in four separate parts as you suggest. This would throw quite unusual and unnecessary strains on the frame, and would call for special bracing to meet these strains. In other words, a type of frame would have to be got out which would probably be of no practical value for ordinary work.

As to your suggestion No. 4, it seems to me it would be extremely difficult to adjudicate between freak cars built purely for the purpose of winning the trophy, and new departures which might be honest and meritorious designs.

As to No. 5, I do not see how any satisfactory decision can be arrived at on the questions of noise, vibration, smokelessness, or similar qualities, where there is no possibility of determining in a definite and scientific manner the relative co-efficient of various competing cars.

As progress in motor car development now is likely to take the shape of improvements in details, it seems to me that the club could best further the interests of the industry by holding annual exhibitions at which manufacturers and others might submit new or improved devices, the relative merits of these to be reported upon by a committee of properly qualified judges.

Such an exhibition would present a splendid opportunity, especially for an impecunious inventor, to bring a particular improvement before the notice of the general motoring public.

Mr. J. W. Stocks :—

I have read your article on the Tourist Trophy Race, and also the letters which have appeared on the subject, with considerable interest. It is only a week or two ago that I penned a letter to the motor journals explaining why it was impossible for me to enter any cars on behalf of Messrs. De Dion Bouton, Limited. The two clauses which bar us are C. and D., weight of chassis and wheel base respectively. The weight of our 10-h.p. chassis would come within the limit stipulated, *i.e.*, between 1,300 lbs. and 1,600 lbs., but the track is 46½ ins., or 1½ ins. too narrow for the conditions laid down. Our standard wheel base is only 6 ft. 8 ins., although we could have entered a long chassis having a wheel base of 8 ft. 9 ins., if the track had been suitable.

We now come to our other twin and four-cylinder models. These are correct in regard to the track, but the chassis would not come within the 1,600 lb. limit of weight, and it would have been useless asking the manufacturers to put special models in hand for this Trophy, as we ourselves were too anxious to obtain deliveries of the standard models for which we have so many orders, and from a business point of view, could not see our way to have these delayed by an excuse about out-of-standard cars, even if the manufacturers had been prepared to fall in with such a suggestion, which I very much doubt.

I believe the conditions laid down for this year's trials exclude other well-known makes of cars besides the De Dion, and suggestions from those who have to be content with looking on this

year will doubtless be welcomed by the Automobile Club, as a guide in framing their next year's conditions.

Dealing with the existing Tourist Trophy rules for this year :—

A. Fuel Consumption—25 miles per gallon.—It is no doubt possible to so arrange an otherwise suitable car that it will cover 25 miles on one gallon of spirit, but I do not think the average user would obtain such results with satisfaction.

B. and C. I will combine these two—Weight of Body and Load and Weight of Chassis.—I suggest that the total weight of the car loaded shall be not more than so much—say 2,550 lbs. If passengers, weighing 22 stones, and 300 lbs. of ballast, brought the fully loaded car up to more than 2,550 lbs., sufficient ballast might be dispensed with to just bring it within the maximum limit.

D. and E. Wheel Base and Track.—I think more latitude should be allowed here, but before another race takes place, doubtless the Automobile Club will have more data in front of them in regard to the different makes of cars which have been excluded under the present regulations.

I have no suggestions to make in regard to *F. Size of Platform behind Dash*; *G. Width of Seats*; and *H. Height of Seats*.

Dealing with your suggested modifications of rules for future years :—

1. Unless some valid reason is given for same, I cannot see that any useful purpose will be served by making the bodies in four independent parts.

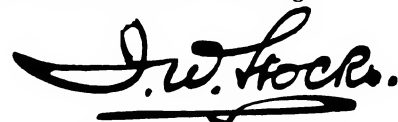

2. I should not agree to exclude single cylinder engines. As a matter of fact, we have sold more cars this year with single cylinder engines than in any previous year, and I would suggest making three classes—one for single cylinder cars, another for twin cylinders, and the third for three or over.

3. *No cars to have more than Four Forward Speeds.*—Agreed. As the engines become more flexible, the tendency appears to be to decrease rather than increase the number of speeds and consequent changing of gears.

4, 5, 6, 7, 8, and 9. I think this year's trials will probably teach a useful lesson in dealing with these questions.

10. Cars to be driven by different drivers each day. This might be at the option of entrant, although I think it advisable for the same driver to take the car right through, unless incapacitated for some reason or other.

11. I think I have dealt with this under No. 2 heading.

Messrs. John I. Thornycroft and Co., Limited :—

Your interesting article on the Tourist Trophy has called forth some equally interesting letters from representatives of the industry, and Mr. Thornycroft instructs me to regret that he has been, and is, too busily engaged with the motor boat reliability trials, and other motor boat events in the south, to write upon the subject.

Mr. Thornycroft thinks that the letters of your correspondents have very well covered and answered the points you raise, but taking them as you have numbered them :—

1. We cannot see the point of constructing the bodies in four independent parts, and agree with Mr. Napier that such construction would be more likely to give trouble.

2. As single-cylinder engines in general may be expected to be less expensive than those of multiple cylinders, besides being somewhat simpler, and, as a very large class of people use single-cylinder cars, we do not see why they should be barred.

3. We agree with you that not more than four forward speeds should be allowed, as, if properly proportioned, four changes of gear is ample for any touring car, and the addition of further changes would add complications, and probably imply a "freak."

4. It would obviously be a very dangerous rule that a "freak" car may be refused entry "at discretion." Motor racing authorities are not always remarkable for discretion, and at least it would tend to lay them open to the charge of prejudice, whether or not it actually existed. The rules should be drawn in such a way as to exclude "freaks" as far as possible.

5. It is certainly very desirable to at least penalise very noisy cars, since, with a well designed and constructed car, at any rate with multiple cylinders, noise is nowadays quite unnecessary. Also we should like to see some differentiation between engine and transmission noise and exhaust noise, since the latter can be stopped or minimised, and the former implies faulty design or construction, and means undue wear and tear. But again, we do not like the word "discretion."

6. We see no objection to extending the race over two or three consecutive days, and, in fact, think it would be better than a single day's race.

7. We agree that the cars should start at time intervals, but not necessarily equal ones, nor in order of numbers, since some cars must inevitably travel faster than others, and unless the faster cars were started first there would be passing, or, at least, overhauling between controls.

8. The institution of frequent controls would probably increase the interest of spectators in the race, and might assist the officials in conducting its progress, and, therefore, may be desirable.

9. The carrying of numbers to denote the laps completed hardly seems a matter of much moment to the entrants, though it might be of interest to the spectators.

10. As the Trophy presumably is awarded to the car, and not to the driver, it hardly seems fair that a manufacturer should be debarred from putting his best driver on the car and keeping him there during the period of the trials. Furthermore such a rule would operate hardly on the smaller manufacturers, though it might not be of so much importance to those of considerable staff.

11. We do not quite see the point of a class for two-seated cars, and think it would be better to arrange a separate class for low-powered cars.

JOHN I. THORNYCROFT & CO., LTD.

There are 8 withdrawals from the above list, viz. :—Nos. 14, 15, 17, 35, 45, 46, 52, 54. The numbers given above are not those which will distinguish the cars in the race.

French Military Motor Wagon Trial.—The results of this trial, which took place in conjunction with the recent Heavy Vehicle Trial of the A.C. de France, are announced, the awards being :—(1) Delahaye wagon, No. 91; (2) De Dion Bouton wagon, 84; (3) Gillet-Forest, 83; (4) Peugeot, 86; (5) Peugeot, (87); (6) Dietrich, 81; (7) Peugeot, 85; (8) Ariès, 93; (9) Latil (avant-train), 88; (10) Ariès (92). Under the arrangement with the French military authorities the first three of these in any case will be purchased by the Government. The weight of the winning Delahaye vehicle, light, is 1,919 kilos., and useful load carried, 1,032 kilos.

Legislation Fund of the A.C.G.B.I. and Motor Union Joint Committee.—In addition to the contribution of £500 of the A.C.G.B.I. and the £400 of the Motor Union already announced, the Berkshire A.C. have now voted a further 40 guineas to their first 10 guineas, making a total from this club of 50 guineas. This Fund has also received a sum of 100 guineas per Mr. Lionel de Rothschild, being 25 guineas each from Mr. A. de Rothschild, Mr. Lionel de Rothschild, Mr. Leopold de Rothschild, and Mr. Evelyn de Rothschild. Amongst others who are assisting are Mr. R. D'Oyley Carte, 5 guineas; Mr. L. H. Nathan, 3 guineas; Capt. F. R. Spencer, Messrs. Albert Brown, and J. S. Finch Hudson, each 1 guinea; Edward J. Thompson, £1; H. Gardner and E. B. Gardner, each 10s. 6d.; J. Madeley, Miss Madeley, and Mr. and Mrs. Granville Kenyon, each 10s.

THE Leicestershire Automobile Club have performed a kind-hearted action, which should go a long way towards rendering the automobile popular with the inhabitants of the midland town. One day last week they placed their cars at the service of the crippled children of Leicester, and fifty of them were given a most delightful day's outing to Nanpantan and Longcliffe. It is hoped that, considering the great pleasure given to the children whose lives have but few pleasant reminiscences to call to mind, this philanthropic (or rather philoædic) application of the automobile will be by no means the last.

"The Future bound to an Automobile"—the original Menu Card designed by Professor Herkomer, for the Banquet held at Munich at the conclusion of the recent German Automobile week.

MOTOR BOATING.

International Cup for Motor Boats.—The British team having been satisfactorily settled, the next most interesting point is the constitution of the French and American representatives. For the latter, Challenger and the Dixie were the only boats announced as likely to run. But by cable the American Club announce their entire withdrawal from the race. Although the French club have three boats engaged, viz., De Dietrich VI, Hotchkiss and Paliasoto, the two former are not thought as likely to take part, which leaves Paliasoto to uphold the French colours. British prospects of bringing back the "Cup"—which, by the times accomplished at Ryde, really never ought to have left these shores—are therefore very hopeful with three such craft as the two Napier boats and Brooke I.

British Motor Boat Club.—A third day's racing will most likely be added on the 22nd to this club's fixture, at Burnham-on-Crouch, on September 20th and 21st.

The races on the 20th will be for the 40 ft. racing class, 30 ft. class, 25 ft. class, and the *bona fide* sea-going cruiser class exceeding 35 and not exceeding 75 ft. over all. The second day's racing will consist of races for 40-footers, 30-footers, and 25-footers.

A WONDERFUL and record run has been made by the Napier 40-foot racing launch owned by Lord Howard de Walden and steered by Mr. Seaton Edge. After running 220 miles during the Motor Yacht Club's reliability trials, she went to Cowes, from which place a trip to the Warner Light was undertaken in exceptionally heavy weather. On the following day the Napier ran from Cowes to the Yarrow Yard at Poplar without a single stop, except two hours spent at Dover in interviewing the Channel swimmers. The actual running time was 9h. 55m., and the distance covered 190½ nautical miles. This works out at the extraordinary average speed of 21½ miles per hour. While motor boats are performing prodigies of this kind, it is no wonder that the naval authorities are proceeding to give their serious attention to the subject. That the motor boat is capable of going to sea in practically any weather has already been satisfactorily demonstrated. The Admiralty is, of course, anxious to obtain reliable results with boats using heavy oil as fuel, and so built as to be capable of being lifted on board war vessels by the davits. That these requirements will be met without much trouble may be confidently anticipated.

At Evian, in France, a three-days' motor boat meeting was held on the lake, commencing last Saturday. A better showing of competitors, both in the racing section and the cruisers, was brought out than has been seen at recent similar meetings on the Continent. The course was a triangular one over a distance of 20 kiloms., and the cruisers on the first day took their turn at racing round it, the winners in each class being as follows:—

Series 1. Under 6½ metres.—Distance 60 kiloms. (1) Mendelssohn (Mutel motor), 2h. 44m. 19s. (2) Delahaye V., 2h. 57m. 5s.

Series 2. 6½ to 8 metres.—60 kiloms. (1) Excelsior VII., 2h. 39m. 21s.

Series 3. 8 to 12 metres.—100 kiloms. (1) Forces-Pas (Mors motor), 3h. 5m. 18s. (2) Delahaye VI., 3h. 21m. 41s.

On the second day a new world's record was put up for 100 kiloms. by the 8-metre boat Antoinette III., her time being 2h. 15m. 50⅓s. The winners on this day were:—

RACERS.—100 kiloms. (1) Antoinette III. (*under 8 metres*), 2h. 15m. 50⅓s.

8 to 12 metre Class.—(1) New Trefle, 2h. 35m. 37⅓s.

CRUISERS. 40 kiloms. **Series 1. Under 6½ metres.**—(1) Mendelssohn, 1h. 46m. 35s.

Series 2. 6½ to 8 metres.—(1) Excelsior VII., 1h. 53m. 36⅓s.

Series 3.—(1) Qui Vive (Picker motor), 1h. 34m. 0⅓s.

On the last day the *extra réglementaires* class boats occupied the day's programme.

In this class Marie Madeleine did the best time over the 20 kiloms. in 1h. 28m. 56s. For the standing mile, and the flying kilom., Antoinette in the Racing Class was first with times as follows:—Flying kilom., 1m. 17⅓s.; standing mile, 2m. 54⅓s. In the Cruisers, Forces-Pas was timed for flying kilom., 1m. 50⅓s.; standing mile, 3m. 20s.

THE RT. HON. SIR JOHN POUND, BART., the chairman of the London General Omnibus Company, when presiding at the half-yearly meeting of the company last week, was very hopeful of the future of the motor 'bus. In addition to £20,000 carried to the motor fund six months ago, a further £20,000 out of profits has been placed to the same account this half-year "for experimental motor services." Up to June 30th under £7,000 of this £40,000 had been used, so that the L.G.O.C. should be in a good position to be near the top in the end. The chairman, referring to the motor omnibuses, made the following remarks:—

"We have organised a repair department under a competent engineering expert, have trained practically a number of drivers, built omnibus bodies in our coach factory, and as the chassis are delivered will be prepared to put more motor omnibuses on the roads under the most favourable working conditions. We expected ere this to have had a larger number of motor omnibuses at work. Those delivered have all been behind time, some were found on examination to be unsatisfactory, and we preferred to wait for machines which we believe to be reliable and durable rather than put a number of vehicles on the road which would probably result in a heavy working loss. I believe that the motor omnibus has come to London to stay, but I am equally convinced that some of those now working in our streets will cause their proprietors to wish they had not embarked in so speculative an enterprise. For the first few months or a year there is little or no difficulty in showing a good profit on the running of a service of new motor omnibuses, but maintenance charges increase with the age of the vehicles, and it will be of interest to watch the results of those undertakings which are dependent on motor omnibuses alone. For some years to come horse traction, which has given us such good results in the past, will be the backbone of our company."

ONE Joseph Pilkington, of Preston, is evidently accustomed to being unexpectedly tickled, for when the motor car driven by Mr. F. W. Mellowes, of Sheffield, passed him at a high rate of speed, he declared in evidence at the Preston police court that the "waft" of wind it produced was such that he thought someone was tickling him from behind. When he discovered this was not the case, but that a rapidly driven motor car was the cause of the sensation, he had to sit down on the pavement to recover from his terror! But the motorist was fined £5 as the result of this graphic and obviously *utterly truthful* evidence—evidence worthy of a niche in the temple of fame, alongside that of the road-mender who stoutly maintained that his shovel had been whirled three times round his head by a blast of air due to a similar cause.

HERKOMER TROPHY.—The start of Mrs. Gertrude Eisenmann, the only lady driver in the Motor Cycle Race in the Forstenrieder Park.

MOTOR CYCLING.

Auto-Cycle Club.—In connection with the six days' reliability trial, the judges have recommended to the Committee that the following awards (arranged in alphabetical order) be made:—

First Class Certificate and Gold Medal.

BICYCLES.—No. 1, $3\frac{1}{2}$ -h.p. Brown; No. 13, $2\frac{3}{4}$ -h.p. Phellon and Moore; No. 14, $3\frac{1}{2}$ -h.p. Phellon and Moore; No. 22, 3-h.p. Singer; No. 19, 3-h.p. Triumph; No. 2, $2\frac{3}{4}$ -h.p. Vindec Special; No. 3, $3\frac{1}{2}$ -h.p. Vindec Special.

TRICARS.—No. 33, 10-h.p. Lagonda.

First Class Certificate.

BICYCLES.—No. 25, $2\frac{3}{4}$ -h.p. Ariel; No. 8, 3-h.p. Bradbury; No. 21, $3\frac{1}{2}$ -h.p. Noble; No. 5, $3\frac{1}{2}$ -h.p. Ortona; No. 9, $3\frac{1}{2}$ -h.p. Rex (fitted with Halle spring wheels); No. 15, $3\frac{1}{2}$ -h.p. Rex; No. 6, $2\frac{1}{2}$ -h.p. Werner.

TRICARS.—No. 30, 6-h.p. Quadrant Carrette; No. 31, 6-h.p. Riley.

Second Class Certificates.

BICYCLES.—No. 11, 5-h.p. Ariel (twin cylinder).

TRICARS.—No. 27, $2\frac{1}{2}$ -h.p. Mototri-Contal.

Third Class Certificates.

BICYCLES.—No. 16, $3\frac{1}{2}$ -h.p. Riley.

TRICARS.—No. 29, $4\frac{1}{2}$ -h.p. Riley.

Appearance Prizes.

BICYCLES.—1st, No. 2, $2\frac{3}{4}$ -h.p. Vindec Special; 2nd, No. 1, $3\frac{1}{2}$ -h.p. Brown.

TRICARS.—1st, No. 33, 10-h.p. Lagonda.

Motor Cycle Cup.—In consequence of the notice, that no permit had been given for this event, served by the Auto-Cycle Club on the clubs which had entered teams for this contest, organised by the Motor Cycling Club, all the clubs withdrew, leaving the Motor Cycling Club team to run over the selected course by themselves. The club team consisted of J. van Hooydonk (Trimo), E. March (Trimo), A. Candler (Quadrant bicycle), C. W. Brown (F. N. bicycle), H. Booth (bicycle). The road for the 100 miles "non-stop" run started at Walton, following the regular route of the club to Stevenage, Royston, Puckeridge, and Wades Mill. Heavy rain fell soon after the start, and before 50 miles had been covered Hooydonk, Fox, and Candler were put out by stopping. The remainder of the team, after lunch, completed the second 50 miles successfully, the total team marks being 375, beating the figures for the previous year.

THE death, at the age of forty-six, of Michel Werner, the designer of the Werner motor bicycle in 1897, is announced from Paris.

"A COUNTY BENCH."

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—Having ridden and driven horses for thirty years both in London and the country, besides taking many driving tours and cycling extensively, I write to-day as no youthful novice lacking road experience.

For a whole year past, being one out of the many pioneers in the great traffic development of this new century, I have given up a stable in favour of driving my own motor car, and have travelled many thousand miles all over the South and Midlands of England, with safety to the public and satisfaction to myself and family.

Last July I was caught for the first time in a "Police Trap." It was the usual clear, open, straight, stretch of level, without cross-roads; no danger was alleged, merely a speed said to exceed (by four miles per hour, being eight seconds in the measured quarter-mile) the pace at which the car was by law entitled to travel.

Passing over, for the present, the absolute impossibility of measuring these eight seconds accurately without electricity and with only one stop-watch I confine myself to one point of the "trial."

Travelling too fast is a technical breach of the law. It is not a crime, but an offence created such by Act of Parliament, and therefore in a different category to theft or the grosser forms of wrongdoing.

Yet, every driver or gentleman summoned was placed in the dock, barred in, and guarded by policemen! This dock had, that morning, whilst motorists waited their turn for three hours on side in the village street, been occupied by "drunks and disorderlies," assault cases and the like.

A County Bench may be indebted for their interpretation of law to their clerk, and to the police exclusively for facts, but at least their methods are their own.

There is this extenuation; neither a village courthouse nor its court are quite suitable for trying issues of any nicety as to facts or feelings. The one was constructed and the other appointed to deal with simple country cases—such as poaching; therefore, county justices are naturally prone to think that anything caught in a trap must be noxious, and to regard a stop-watch as a fetish, and to be profoundly impressed when one of their rustic constables, under oath, talks about "fifths of a second."

But to anyone who is making a first acquaintance with these rural dispositions the whole proceeding gives a most disagreeable impression. Defendants, on a purely technical and practically unprovable charge, pleading, from a criminal dock, for that form of mercy which in a less elementary court would be termed justice, present a painful spectacle which discredits the English magistracy.

Moreover, to men, or even ladies, who may be about to set up a car, the possibility of such discourteous treatment may well give pause.

Your obedient Servant,
LEVESON SCARTH.

August 23rd.

VAN TRIALS POSTPONEMENT.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—Having received notice from the Automobile Club that the Van Trials, for which we had entered, have been postponed by the Committee until next year, we have thought well to address a letter to the secretary, of which we enclose a copy. We cannot help thinking if the club had all arrangements in order, a very interesting trial could have been carried through with the number of vehicles that were entered.

Yours faithfully,
HARRY PARSONS,
The Parsons Motor Co., Ltd.

August 26th.

[Enclosure].

The Secretary of the Automobile Club.

We beg to acknowledge with thanks your favour of the 24th inst., in which you convey to us the decision of the Committee to postpone the Van Trials until the year 1906, in reply to which we can only say that we regret exceedingly the decision

arrived at, not only because we were under the impression a fair number of entries had been received, in which presumably we were wrong, but also because it hardly seems fair that those firms who had conformed to the conditions and got their vehicles ready should be handicapped by still another postponement, when they may be, as in our case, perfectly ready to start the trials at any moment.

Perhaps we may be allowed to point out that we know for a fact that many orders for light vans were being held back pending the results of these trials, and therefore it means to us, we fear, considerable loss of trade, in that firms, who were waiting to see how a van like ours behaved, will still further delay their order. The obvious reply to this is, no doubt, that the Automobile Club has ostensibly nothing to do with trade interests, but all the same it appears to us that the deferring of these trials is also partly due to representations of firms who do not happen to have conformed to the regulations, and got their vehicles ready for the trials. It appears to us, therefore, that deprived as are those firms who entered from making a willing demonstration of their vehicles, it would be only fair to publish a list of those who had entered for it, and there we suppose the matter must rest.

The proximity of the exhibition is put forward as one reason for delay, but surely possible purchasers visiting that exhibition would appreciate being able to examine and possibly purchase a van which had done creditably in the trials, rather than look at a vehicle which, through no fault of their own, the makers had been unable to publicly demonstrate.

In writing to you thus we are aware that it is not a foregone conclusion that our vehicle would have performed in every way satisfactorily, but we were quite open to go in and compete, having every confidence in our van, and to be judged according to results.

In conclusion, we were aware our entry was delayed till the last moment, but this was solely due to the fact of there being some difficulty in reaching one of our directors in the matter.

Trusting, therefore, you will favour us with any remarks upon these notes, and apologising for troubling you.

VISITORS to the Doncaster Races should beware of a police trap which will, in all probability, be established at Bawtry.

A SIDE paraffin lamp, found in Avenue Road, St. John's Wood, about three weeks ago, was brought into the St. John's Wood Motor Works and Garage, 20 and 22, Finchley Road, N.W. (opposite Marlborough Road Station) on Thursday last. Owner can have same on giving description.

Mr. Wm. Beardmore, of Tullichewan Castle, Dumbarton, has just added to his stud the fine 24-h.p. Thornycroft Car, which we illustrate above. Mr. Beardmore, in addition to this acquisition, is the owner of a 6-h.p. Wolseley, a 12-h.p. Arrol-Johnston and a 20-h.p. Thornycroft, and for marine work has a 25-ft. Thornycroft motor boat, which he uses extensively on Loch Lomond.

The latest acquisition of H.R.H. the Princess of Wales. This fine specimen of car is a British-built Daimler, the body work having been executed by Mr. H. J. Mulliner.

The Princess of Wales's New Daimler.—The latest car of H.R.H. the Princess of Wales, which we illustrate this week, is one of the most up-to-date Daimler carriages, and is a fine type of combined luxury and utility. Mr. H. J. Mulliner, of Brook Street, was entrusted with the body work of the car.

The Princess has taken a great interest in the building of this carriage, and personally instructed Mr. H. J. Mulliner with regard to many details embodied in it. It will be seen that the roof of the carriage extends over the driver's seat in the form of a canopy, with a glass wind-shield over the dashboard. This shield slides up into the roof by a very neat knuckle-joint arrangement, which entirely does away with any possibility of the rattling so frequently associated with this type of wind-shield. The placing of a long platform on each side renders entrance to the car extremely easy. There is also a folding step which reaches within 10 inches of the ground. The body is of Limousine type, and is constructed of light ash framing, with aluminium panels. All the door and corner panels are hammered out by hand, giving the graceful curves depicted. The window frames and all fittings are of special figured rose-wood, French polished. The interior is upholstered in royal colour, *i.e.*, dark blue, the cushions and back being in morocco. The roof is covered with blue cloth. The upholstery is finished in an especially luxurious manner, the internal fittings and conveniences, such as silk blinds, trays, pockets, racks, watch case, speaking tubes, &c., combining to assure a high degree of comfort and appearance. Above the main seat electric

lights are fixed, the switches of these being within easy reach of the occupants. On the main seat accommodation is provided for three, and two additional seats, which can be let down when not required, are available. Both the side windows and the window behind the driver's seat let down into the body, thus giving all the benefits of an open carriage. In order to prevent possibility of dust reaching the interior the rear window is made a fixture. The boot under the main seat has an opening at the back, and into this boot is fitted a picnic basket, provided with all the necessaries for an *al fresco* meal. A spare-tyre carrier is fixed on the right-hand side, and this can be detached when the car is not running.

The Princess of Wales particularly requested Mr. H. J. Mulliner to, as far as possible, use English material in the construction, consequently everything connected with the car is of English make.

THE motor car which was purchased by the Edmonton Board of Guardians for conveying persons to the infirmary and asylum, has been running up a pretty bill for repairs, having cost, it would appear, during the last nineteen weeks, £127, and a further proposal to spend another £20 on it was made at a recent meeting. On this occasion Mr. Jolly very sensibly pointed out that all the trouble was due to the Board having in the first instance purchased a cheap car instead of having bought a really reliable vehicle as recommended to do by a committee.

One of the latest 15-h.p. four-cylinder De Dion Bouton Cars is given in the above photograph and is fitted with an English built tonneau carriage with cape cart hood, &c. This car, which is of particularly good design, has been secured by Mr. P. J. Ford, of Edinburgh. A convenient improvement is the glass wind shield, the top half of which is made to hinge outwards from the top and is supported by the slides seen in the photograph. By this means the shield can be set at an angle which gives protection to the driver during rain storms, and at the same time allows him a clear view.

HERKOMER TROPHY.—How petrol is pumped from big tanks into cars and sold by weight in Germany. This view was taken by Mr. Edward Manville, with the British team of Daimler cars, en route from Strassburg to Munich.

IN the course of a paper on "Motor Cars for Medical Officers," read at the annual provincial meeting of the Society of Medical Officers of Health at Lancaster, Dr. Herbert Jones, Medical Officer of Health for Hereford, while pointing out that the existing destruction of roads is mainly due to horse traffic, attributed a large number of diseases, notably epidemic diarrhoea, to the infection and insanitary conditions produced in towns and elsewhere by the requirements of horse-stabling. He concludes that the universal adoption of the automobile for traffic purposes will have a most profound effect upon the health of the community.

THESE views are borne out in a remarkable manner by some statistics published by Dr. McCleary in his report on the health of the Metropolitan Borough of Battersea, a work to which we referred last week in these columns. Dr. McCleary points out that according to Veterinary-Captain Smith's "Manual of Veterinary Hygiene," the average amount of excreta passed by a horse in twenty-four hours is about 30 lbs. of solid and about 5 quarts of liquid matter, and one-half of solid and one-fourth of the liquid matter is deposited in the streets. Assuming, however, that the amount of excremental matter deposited in the streets is equal to one-third of the solid and one-fourth of the liquid matter, we arrive at the conclusion that over 362 tons of solid, and over 23,377 gallons of liquid horse manure are deposited in the streets of London every day, while the daily amount of manure deposited in stables is over 725 tons of solid matter, and 76,131 gallons of liquid matter." It is no wonder that with one eye on such facts as these, and with the other eye on the innocuous characteristics of the automobile, our medical officers of health should be commencing to exclaim, "Away with the horse!"

GALLEY, who has concentrated attention upon himself by his masquerades as the Baron de Graval and his cruise to Brazil with the bullion he lifted from the bank, is, it would appear from a French contemporary, an author on automobile topics. He has, at any rate, written "A Treatise on Motor Cars for the use of Society People," and MSS. were found at the flat he recently occupied, entitled "A Study on Navigable Balloons," and "The Future of Motor Boats." The enterprise of Galley is well illustrated by his grappling these subjects, as it is stated he has never been in a motor boat or driven a motor car. Upon his knowledge of navigable balloons no data are forthcoming.

MR. C. J. GLIDDEN is probably the most indefatigable globe-circler in existence. He has hardly finished one tremendous tour when he proposes starting off on another. As our readers know he has already been once quite round the world, covering 25,100 miles in twenty-four different countries, and he now proposes to go round the world again, traversing India, Ceylon, Burma, Siam, the Philippines, China and Japan. Mr. Glidden intends to leave America on October 24th, when he will cross to London, and leave Marseilles for Bombay by the "Mooltan," which leaves the former port on November 10th. Mr. Glidden, who will be accompanied as usual by Mrs. Glidden, intends to return to America from Japan by way of San Francisco, to take part in the "Glidden Touring Competition" in the U.S.A. in 1906.

Lincolnshire A.C.—Capt. and Mrs. Glead, of Park House, Donington, were "at home" to the members of the Lincolnshire Automobile Club, on Thursday, August 24th. The delightful weather which prevailed enabled cars to travel long distances. A hearty welcome was extended to all comers. *Al fresco* tea was served in the picturesque grounds, which are just now in the zenith of their summer beauty. Croquet and other lawn games were provided, and the pleasant outing was greatly enjoyed.

Meet of the Lincolnshire Automobile Club at Park House, Donington, the residence of Captain and Mrs. Glead.

successful it is intended to add a luggage equipment, and so arrange for a regular passenger service.

ALTHOUGH the firm of De Dietrich is best known here in association with the justly famous cars under that name, they are primarily builders of much heavier vehicles, as witness their supplying a number of carriages for the Electric Underground railway of London. These District Railway cars are built entirely at Lunéville, in the same works as the De Dietrich cars, with the exception of the electrical apparatus, which is fixed in England. The cars are completely mounted at the works, sent on rails up to Rotterdam, and shipped thence by special steamers, eight at a time, to London. Messrs. De Dietrich have already delivered fifty-two of these

SCENES ON THE GLIDDEN TOUR.—One of the White cars paying at one of the many toll gates.

THE London Motor Omnibus Company, which has made such a conspicuous success with running its Vanguard service of 'buses, is undertaking an interesting experiment. It is arranging to run to Brighton and back daily for a week with a Vanguard 'bus, for which the fares will be practically those charged by the Brighton coaches, viz., 12s. 6d. return outside, and 10s. inside. The first run took place on Wednesday last, the 'bus starting from Northumberland Avenue at half-past nine in the morning, and returning from Brighton about three in the afternoon. About four hours was allowed for the journey of 50 odd miles. The object of the company is an experimental one, as they desire to ascertain how far the modern motor 'bus can be employed on road service to compete with railways. Should the experiment prove

SCENES ON THE GLIDDEN TOUR.—A short cut through a stream.

vehicles and are now finishing sixteen more, which will be delivered shortly.

QUITE exciting adventures befel General Booth on his motor car tour in the north. Coming back from Hawick and crossing the Cheviot Hills the party lost their way and took to rough tracks and the grass across the mountains, which the cars negotiated with extraordinary success. The lost motorists crossed into England at Carter Fell, where the boundary was marked by a stone wall and the ruins of an old toll gate, after which they struck a road that brought them ultimately back into civilisation, marked by the sudden apparition of a gibbet with a dummy head hanging from it. The successful manner in which the cars negotiated the rough mountains is certainly a testimonial to the capabilities of the up-to-date automobile.

SCENES ON THE GLIDDEN TOUR.—Memorial Bridge near Milford.

the unsupported statement that the assaulted one extruded his tongue as justification for the assault. In future probably all hooligans will make the same allegation.

FROM October 1st the borough of Southport will be constituted a county borough, and therefore the Local Government Board have allotted them the new index mark of "F.Y."

THEY are evidently a thirsty community who form the parish council of Ringmer, near Lewes, where the steeplechases are held. The County Council has recently put up danger signals on some of the steep hills, and the red triangle adopted has so reminded the parish councillors of the similar symbol appearing on Bass's bottled ale, and has thus excited desires on the hot and dusty days of summer which there was nothing present to assuage, that they are pressing for the substitution of some other form of signal.

As an alternative, we would suggest the provision of a supply of Bass's bottled ale in the neighbourhood of the suggestive signal posts.

SCENES ON THE GLIDDEN TOUR.—Where they burned the witches at Salem, U.S.A.

W. K. VANDERBILT has just purchased a 40-h.p. De Dietrich car.

As an example of what the magisterial mind can accomplish, the following is instructive:—Mr. G. H. Smart, of Kew, was charged at Andover, and "duly" fined £5 and costs, for driving a motor car to the common danger. He declared that he was only travelling about 10 miles an hour. Thereupon the chairman (Colonel Harman) of the Bench declared that at this particular place any speed over *two miles* an hour was, in his opinion, dangerous. This was on the main road running straight from Andover to Salisbury!

THERE is an hotel on the top of the Weissenstein in the Jura, at a height of 4,000 feet, with which the sole means of communication is a little cart which is dragged daily by four horses up a road which boasts a gradient of over 1 in 4. The inmates of the hotel were recently astonished one morning to find a little 6-h.p. Swiss built automobile standing outside the door. As it had made the climb, with three passengers, under one hour, it is not surprising to learn that the hotel will probably adopt the automobile as a means of communication with the lower world in the near future.

A VERY extraordinary case came before the Mansion House Police Court last week in which a city merchant of the name of Arthur Bagshawe was alleged to have assaulted a motor-car driver of the name of John Tambourne by striking him in the face. Mr. Bagshawe admitted the offence, but the summons against him for the assault was dismissed. In mitigation of his offence he alleged that the motor-car driver was going slowly through the traffic, and that when he remonstrated with the driver for nearly running over him, the latter made an impertinent remark and extruded his tongue. There was no confirmatory evidence of the extrusion of the tongue of the motor-car driver, and Sir Horatio Davies, the magistrate who "tried" the case, gave clear proof of animus, as he said, "I know it is very trying. I was nearly knocked down myself by a cyclist the other day immediately opposite the Mansion House, and if I had not knocked the man off his bicycle, he would have run over me. I shall dismiss the summons." Had the victim of the assault been anything but an automobilist, we feel convinced that the magistrate would not have accepted

Viscount Churchill, Lord-in-Waiting to His Majesty the King, who for a long time has been an ardent supporter of the automobile movement is shown in our photograph at the wheel of his 24-h.p. Napier car which he has invariably driven himself from the time when he acquired this carriage, about the middle of last year. Lady Churchill, who also drives this car, both in the London streets and in the country, is also seen in our photograph.

ROAD-TARRING experiments which have been carried out on limestone roads in Glamorganshire, under the auspices of the Porthcawl District Council, have proved most successful. It seems that limestone as a road metal amalgamates particularly well with tar.

A FRENCH contemporary, in giving an account of the automobile cabs recently put on the London streets, and comparing them with "hansoms," has got hold of the word "hippomobile"—by the wrong letter, having converted that euphemism for the "gondola of the London streets" into "kippomobile." Perhaps this is a subtle method of commenting upon the imperfect stability of these conveyances.

WE have to congratulate the Chertsey Bench. It is seldom that we have had to do so, and more than once we have been reluctantly compelled to express the strongest dissent from their findings and proceedings. We are, therefore, the more pleased to discover ourselves in full agreement with them, especially as the case to which we refer is of wide general interest and importance to automobilists, and causes regret that the decisions of one magisterial court do not constitute precedents for others. Inspector Jarrett, in what was perhaps humourously termed "the execution of his duty" at Egham (he was, as most people will remember before his "translation" to that sphere of activity, the champion police-trap-organiser of the Ripley Road), had arranged a police trap, and got it in full blast in the neighbourhood of Chertsey. Mr. A. T. Slaymaker, a motor car driver of Chelsea, detected the trap, drew up his car at some distance from it, and warned approaching motorists of its existence, who thereupon slowed down so palpably that even Jarrett, in his new "Avatar," as Inspector, was not able to "charge" them. Presumably Inspector Jarrett had not been able to import from the Ripley Road the celebrated children who always figured in, and produced, or at any rate secured, conviction in his former cases. So much irritated was he by the failure of his trap that he summoned Mr. Slaymaker for obstructing the police in the execution of their duty. He informed Mr. Slaymaker at the time that he would take this course, and Mr. Slaymaker very naturally and properly observed, "I have not spoken to you. Your duty is to prevent people from breaking the law." The Chertsey magistrates came to the conclusion that there was no obstruction in the sense contemplated by the Act, and dismissed the summons. It is, of course, preposterous to suggest for a moment that such warning is in any way obstruction of the kind referred to, and summonses taken out under such circumstances only display the irritation of the police. Unfortunately, however, they have been successful with one or two benches of magistrates.

IN another case, however, Inspector Jarrett himself vindicated the rights of the road. Mounted on a cycle, he was endeavouring to proceed along a narrow thoroughfare near Chertsey when he

asked a Staines farmer driving a horse and trap to make way for him. This the courteous farmer refused to do, for which obstruction he was subsequently fined 10s. by the Chertsey Bench.

NEW COMPANIES REGISTERED.

[Taking powers to manufacture or deal in motors, motor cars, or accessories, either as their principal or parts of their objects.]

B. W. (Start Cold Paraffin) Carburettor Company (Limited), 9, Southampton Street, Bloomsbury Square, W.C.—Capital, £100,000 in £1 shares. Chief object, to adopt an agreement with A. J. Watling, C. H. Bryant, and J. A. Malcolm, and to carry on the business of mechanical engineers, manufacturers of carburettors, automobiles, &c.

Corre Depot (Limited), 311, Oxford Street, W.—Capital, £2,000 in £1 shares. Object, to act as sole vendors in the United Kingdom of the productions of Automobiles Corr   (Limited), of 311, Oxford Street, London, and 37, Rue de Villiers and 12, Rue de Rouvray, Neuilly-sur-Seine, France. First directors, P. Baxter and J. Edwards.

F. W. Peckham Motor Syndicate (Limited).—Capital, £1,000 in 500 "A" and 500 "B" shares of £1 each. Object, to sell motor cars under contracts (1) with the E. R. Thomas Motor Company, of Buffalo, New York, and (2) with Richard Irvin and Co., of New York. First directors, F. W. Peckham and R. L. Powell.

Finchley Motor and Engineering Company (Limited).—Capital, £2,000 in £1 shares. First directors, B. T. Hamilton and J. G. Gittos.

P. W. Watson and Sons (Limited).—Capital, £8,500 in £5 shares (400 preference). Object, to acquire the business of carriage, coach, cart, and motor car builders at Lowestoft and Diss. First directors, P. W. Watson, P. W. Watson, jun., and L. D. Watson.

Rekrab Motor Manufacturing and Engineering Syndicate (Limited).—Capital, £5,000 in £1 shares. Chief object, to adopt an agreement with A. Barker, and to carry on the business of motor manufacturers, &c.

The Scottish Fishing Boat Power Supply Company (Limited), 245, Union Street, Aberdeen.—Capital of £10,000 in £1 shares. Object, to develop the sale of the central valve internal combustion engine for fishing boats.

United Manufacturers' Military and Motor Accessories (Limited).—Capital, £4,000 in £1 shares (1,000 ten per cent. cumulative preference). Object, to take over the business of manufacturers of motor and general clothing, &c., heretofore carried on by R. Starke, at 31, Golden Square, W., as the United Manufacturing Motor Clothing Company, and at 2, Brewer Street, W., as the Military and Motor Head-Dress Company. First directors, R. Starke (managing director) and J. Affleck.

A new Double Electric Landulette, just constructed by the Electromobile Company for Mr. Drysdale, of Buenos Ayres. The carriage work is by Binder, of Paris.

THE successful English Daimler cars, competing in the "Herkomer" contest, were, we learn, all fitted with "Castle" coils—one of the specialities of United Motor Industries, Ltd.

THE first four winning cars in the Herkomer Race were all fitted with Continental tyres, and we learn of the first twelve cars in order of merit no less than ten were shod with Continentals.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

17284. 6th August, 1904. Improved Speed Gears suitable for Motor-Driven Vehicles and the like. Charles V. Boys, F.R.S., 66, Victoria Street, Westminster, and William Williams, B.Sc., Glasfryp, Uplands, Swansea. This invention consists in an improved form of epicyclic change-speed-gear for tricar, quad and motor cycles, having provision for two or more speeds forward, quick and slow-foot pedalling speeds backward and forward, free wheeling and free engine running positions and for engine starting by foot pedalling or by manual power through the gear while the vehicle is at rest. It comprises an epicyclic three-speed reducing gear, a rotating gear frame carrying two or more planet groups, each comprising four planets, two of which mesh with two suns mounted one upon the other and provided with brakes, while the other two planets of each group mesh with other two suns arranged coaxially with the first mentioned suns, one of the second mentioned suns having an independently actuated brake or ratchet and a free wheel sprocket adapted to permit manual or pedal starting of the engine through the gear and forward and backward driving independently of the engine, and the other being connected to or arranged to drive the road wheel. There are four figures. Fig. 1 is a section on an axial plane through the centre of the gear. The power transmission pulley, *a*, is secured concentrically to an epicyclic framing, *b*, containing two or more groups of planets, each group comprising four planets, *c*, *d*, *e* and *f*, which are non-rotatable in relation to each other, but are revoluble together upon ball bearings, *g*, *h*, about axes, *g*, carried in the framing *b*. The four planet wheels gear with four sun wheels, *j*, *m*, *s* and *t*. The epicyclic frame, *b*, is provided with a sleeve, *k*, which passes over a fixed axle, *i*, or over a tube thereon, and is provided with ball bearings, *7*, *7*. Revolvably mounted on ball bearings, *8*, *8*, upon the sleeve, *k*, is a sun wheel, *j*, having a hub formed in two parts, *k* and *k'*, locked together in any suitable manner which will allow of the two parts being readily detached when required,

occupied by the high and low speed suns, and carries at its extremity upon ball bearings, *12*, a free wheel chain-driven sprocket, *r*, and a brake rim, *w*, having a brake, *w'*. If the high and low speed suns are locked by their respective brakes, *g* and *r*, the low speed sun, *m*, which has more teeth than the high speed sun, will be moved forward slowly. This it is enabled to do on account of its rim, *m'*, running free forwards whether the low speed brake drum is stationary or not, and the middle speed sun, *s*, is free to rotate forwards since the brake is off and the sprocket wheel free. The driven wheel, *f*, is thus rotated at fastest speed. If now the high speed brake is released, and the brake, *w'*, put on, the middle speed comes into operation. On releasing the brake, *w'*, the low speed comes automatically into action, the brake, *r*, being on. On releasing the high, intermediate and low speed brakes from their brake rims, the spring, *15*, being in the middle groove, a free engine running position is obtained, and on moving the low speed brake until the low speed sun is held, the low speed is obtained. While either of the lower speeds is in operation the high speed sun and the middle speed sun run idly backwards, which the latter is free to do without moving the foot pedalling gear on account of the free rim of the foot pedalling chain wheel.—August 10th, 1905.

17502. 11th August, 1904. Improvements in Change-Speed-Gears for Motor Cars. Kenneth S. Murray, 9, Duke Street, Portland Place, London. The driving shaft in this invention is made in two portions with a secondary clutch between pressed into engagement by a spring to drive through the higher speed gear, and means to automatically cause the disengagement of the secondary clutch and drive through the low speed gear on the occurrence of excessive load. There are eight figures. Fig. 1 is a part sectional plan. On the engine shaft the usual hand-operated mechanical speed-change-gear is disposed with, but the pedal-clutch is retained. In place of the ordinary mechanical speed-change-gear is interposed a secondary clutch and mechanism, and in addition to the usual bevel wheel working on the

MOTORING visitors to Southampton should bear in mind the garage of the Parsons Motor Company, Limited, at the Town Quay. The company have exceptional facilities for shipping cars from their jetty either to the Continent or the Isle of Wight, whilst the garage is available for those who are not taking their cars with them over the water. The firm were in charge of the transfer to Cowes recently of H.R.H. Princess Christian's 24-h.p. Landauette.

E F, a strong spiral spring, *K*, is mounted, one extremity of the spring bearing upon the back of the cone portion, *E*, whilst the other end of the spring extends over a part of the portion, *A*, of the engine shaft, and is received in a recess in a sliding ring, *k* (having a ball-race, *k'*, to take up thrust), a second ring, *k''*, is mounted, which may be moved by the driver of the car operating a lever. A sleeve, *R*, is formed on the bevel wheel, *P*, of the differential gear, in order to carry two bevel wheels, *P'* and *S*, which can slide but not turn on the sleeve, *R*. These wheels, *P'* and *S*, are connected together, and either can be caused to engage with one side of the bevel wheel, *J*, on the portion, *A'*, of the shaft. The bevel wheel, *P'*, engaged with the bevel wheel, *J*, conveys low speed reverse movement to the differential gear. The bevel wheel, *P*, has a pawl and ratchet movement interposed between its bevel rim and hub, so that it can over-run.—August 10th, 1905.

as, for instance, by a key or pin in one part engaging in a through-way key seat or slot in the other part. Over these parts there is revolubly mounted upon ball bearings, *9*, *9*, another sun wheel, *m*, the teeth of the wheel, *m*, being cut on a free wheel rim, *m'*, which is free to run forwards. The wheel, *j*, is for the high speed and the wheel, *m*, for the low speed. Side by side on the hubs of the wheels, *j* and *m*, are arranged brake rims, *q* and *r*, respectively, which are actuated by brake bands, *q* and *r*, controlled by levers in any suitable manner, preferably, however, in such a manner that one lever controls both bands. Co-axial with the low and high speed suns, *j* and *m*, are two other sun wheels, *s* and *t*, on ball bearings, *10*, *10*, and *11*, *11*, which wheels gear respectively with planets, *e* and *f*, the sun, *s*, being for the intermediate speed and the wheel, *t*, being the driven sun. The driven sun is connected to a hub, *4*, which is mounted on the ball bearings, *11*, *11*, the hub either forming the hub of a road wheel, in which case the hub may have side flanges, *u*, *u*, for the spokes, *x*, *x*, the distance, *z*, being then made greater than that shown in the drawing to suit the width of the road wheel hub, or forming the hub of a transmission wheel, *3*, in which case the hub serves as a counter-shaft. The hub, *s'*, of the middle speed sun, *s*, extends to the opposite side of the casing from that

sprocket shaft, a smaller bevel wheel is fixed to gear with corresponding bevel wheels attached to the crown bevel wheel of the differential gear. Between the engine clutch and the secondary clutch the engine shaft is divided, and the portion *A*, to which the main clutch is attached, is enlarged in diameter at *B*, and screwed with a quick or multithreaded screw. The other portion, *A'*, of this shaft, on the extremity of which the small bevel wheel, *J*, is formed, is shown hollow, so that the end of the shaft passes through it, and the portion, *A'*, is fitted with a feather, *D*, on which the external cone, *E*, of the secondary clutch, E F, is mounted, so that *E* must turn with *A'* and can slide upon it. The portion, *E*, of the clutch is prolonged at *c*, and screwed internally to engage with the screwed part, *B*, of the shaft, *A*. On *A'* is a sleeve, *x*, on one end of which the large bevel wheel, *G*, gearing with the bevel wheel, *P*, of the differential gear, is formed or fixed, the internally coned portion, *F*, of the secondary clutch, E F, being formed or fixed at the other end of the sleeve, *x*. When the secondary clutch is disengaged, the engine shaft, *A A'*, is capable of turning within the sleeve, *x*, and the sleeve with the wheel, *G*, and coned part, *F*, of the clutch is capable of turning on the engine shaft, *A A'*. On the prolongation, *c*, of the coned portion, *E*, of the clutch,

PASSING EVENTS.

The Melting of the Magisterial Mind.

THAT as the automobile became a more and more familiar means of getting about, the hostility and partiality of magistrates would become tempered by sweet reasonableness is a belief that we have always shared. Sooner or later we felt certain that most benches of magistrates would come to include at least one or two motor car owners, while other Rhadamanthi would find amongst their friends many motor car owners. They are, therefore, realising that automobilists are no worse than other people, that they do not ill-treat their wives, or assault the police, and on the whole, when you get to know them, are often enough pleasant fellows, and have even become pleasanter since they purchased motor cars. Therefore Rhadamanthus is becoming inclined to scepticism when asked to believe that policemen are always right and automobilists always wrong. That this better spirit is becoming prevalent amongst the holders of commissions of the peace has been well illustrated recently by several benches of magistrates. It was only last week that a driver in the employment of the Amalgamated Portland Cement Companies of the Medway Valley was let off at Maidstone on consenting to pay the costs of the prosecution, and an even more notable case occurred recently at Settle. Mr. R. Duckworth had been haled before the Bench on the usual charge of exceeding the speed limit, and he had pleaded guilty, when, to his no small astonishment, after a police sergeant had maintained that "The defendant, your Worships, covered the measured stretch

of 1,257 yards at a speed which works out at precisely 25 miles an hour" (the necessary corroborator being also produced), his case was dismissed. One of the magistrates said that the mere opinion of two people as to speed was quite worthless, whereupon the clerk observed that the defendant had already pleaded guilty. Nevertheless the Bench dismissed the case. In another instance at Abergele, an offender was in the first instance fined £2 for driving recklessly, and the magistrates at first refused to endorse his licence; when it was pointed out to them that they were compelled by the statute to do so, they made some very sensible remarks on this absurdity, and in consideration of the fact that they could not refuse to endorse, they reduced the fine to 10s. At Hornby Petty Sessions, too, quite a number of similar cases were dismissed absolutely, some with very strong expressions of disapproval, from the Bench, of the action of the police.

Now, these cases may, of course, be to some extent exceptional, but we are disposed to think that they are the kind of very significant straws which show which way the wind is blowing. After all it is the executive which decides whether a law should be administered sensibly or vindictively, and, we think, these cases show that there is a tendency on the part of magistrates to abandon their hostile and prejudiced attitude and to adopt a sensible, if not indulgent, method of interpreting the Motor Car Acts.

We hope the change in the magisterial mind will become general. There are dozens of Acts, as we have often pointed out, which if administered in the same spirit as the Motor Car Acts have been administered recently, would throw the whole country into confusion.

♦ ♦ ♦ The Coming of the Motor Cab.

THE London cab industry—if that is the term for it—has for a long time been in far from a flourishing condition. A symptom of this is provided by the meeting recently held between proprietors and cab drivers to discuss the general situation. It was widely recognised that improvements in other means of locomotion, the existence of trams, tube railways, and above all the advent of the motor 'bus, have made cabby's condition an even less happy one than it used to be. In fact, it is highly significant to find Mr. Fred Hill, the general secretary of the London Cab Drivers' Union, realising the situation so thoroughly as to be of opinion that the only future for the London cabman lies in his conversion into a motor cab driver. That we may look forward at an early date to a considerable extension of the present small number of motor cabs plying in the Metropolis is therefore probable. When the revolution takes place everyone will be undoubtedly thankful. The motor cab is as great an improvement on the time-honoured hansom as the motor 'bus is on its horse-trundled "rival."

This does not, however, mean the realisation of the gorgeous visions of a French contemporary, which we see some of the London papers have been copying more or less verbatim, that we are shortly to be astonished by the beatific vision of 2,000 motor cabs suddenly appearing from goodness knows where on the London streets, each of the vehicles being attended by two servants, the chauffeur and footman being attired in smart blue uniforms, with several hundred yards of braid and several bushels of buttons affixed. In spite of the braid and buttons, the high speed attained, and the

luxurious fitments, including electric light, of these visionary vehicles, the fares are only to be the same as those at present charged.

At present, the decidedly strict police requirements stand somewhat in the way of the rapid realisation of this millenniumlike vision, as we learn that some projected motor cabs have recently been rejected by the police authorities. It is well, therefore, that it should be recollected that all motor cabs designed for plying in the metropolis must provide ample facility for entering and leaving the vehicle, and must be able to be turned round in a circle of not more than 28 ft. across.

The changed attitude of the London cabman to the motor cab, as illustrated by Mr. Hill's remarks, is an encouraging sign of the times. The cab industry simply cannot continue as it is at present, and the sooner the cab driver takes the motor cab to his bosom, and becomes a motor cab driver, the happier and better off he will become.

♦ ♦ ♦ “(H)andover” Harman.

THERE are elements of entertainment in the situation when the victim of a police trap and a magisterial bench, instead of proving, as usual, a meek and silent sufferer, happens to possess the gift of literary expression, as he is then, at any rate, able to raise a smile at the expense of his persecutors.

The Hon. Stephen Coleridge, one of the latest victims of the notorious Colonel Harman at Andover, and the Hampshire police trap (in regard to which, as we last week related, Lord Portsmouth put up warning placards on his estate), has been exciting a good deal of amusement, both amongst automobilists and others, by his letter to the Press describing how he “fell among magistrates.” The evidence tendered possessed some entertaining features, one of the constables maintaining that on the road in question—one of the main roads in the county—a speed of more than four miles—against Colonel Harman's two miles—an hour was dangerous to the public. The best entertainment provided by the case, however, is in the delightful expressions which Mr. Coleridge has invented in his letter, some of which certainly deserve to live, chief amongst them being his description of police trap organisers as “magistrates' highwaymen” and “notorious fine-snatchers.” He has also provided a parallel expression for the “road-hog” by his description of the disguised policeman who lurks in ditches as a “hedge-hog.”

All this is excellent fooling, and is an example of a man making the best of what is, after all, a very unpleasant experience. The real value of Mr. Coleridge's letter, however, is his appeal to other motorists always to fight these cases through a solicitor where they can. His defence occupied the Andover Bench a whole morning, and, as he points out, the abuse of the executive involved in these persecutions would very quickly stop if every motor car case were equally stubbornly contested. We have often made this suggestion in the past, and no doubt it has only been for financial reasons that it has not been more universally acted upon.

♦ ♦ ♦ The Importance of Appeals.

AUTOMOBILISTS might advantageously extend the above tactics by appealing to Quarter Sessions in all cases where they have the slightest chance of succeeding.

They will probably be encouraged to do so by the fact that of twenty-eight appeals to Quarter Sessions in motor car cases made in 1904 no less than twenty-two have been successful. This is a tremendous indictment of Petty Sessional magistrates, for the Quarter Sessions never like quashing convictions unless in the case of the most palpable injustice. Of course the expenses involved in these appeals are heavy, running usually from £50 to well over £100, but considering the high proportion that have thus proved effective, and the tremendously deterrent effect on magistrates of successful appeals, motorists who can afford the money ought to consider it a duty always to make them, while it is to be hoped that in the near future the funds of the Motor Union will permit of the Union assisting or financing all appeals that seem to have a reasonable chance of success. At the same time it ought to be "one of the unwritten laws of motoring" that the wealthy defendant should refrain from applying for such assistance, so as to render it more widely accessible to those who cannot fight their battles for themselves.

What the Tourist Trophy will Teach.

THE Tourist Trophy, which will be competed for next Thursday in the Isle of Man, is at the present moment the event on which the attention of the automobile world is focussed. Nevertheless we feel convinced that there are a great many people who are still rather hazy as to the precise effect which the rules adopted will have in deciding what kind of a competition will be provided for the entertainment of those who go to witness it. We think we have made it clear to everybody (in previous numbers of the Journal) that the event will be a real race—although essentially for *touring* cars driven under what are (compulsorily) *touring* conditions. But we fear there are still people who imagine that because there are restrictions—restrictions of fuel, which will have the effect of producing a restricted or moderated speed—that it is not in the full sense of the word a race, and that, for example, powerful high speed cars are not allowed to compete. This is a mistake, for any car that complies with certain weight limits can compete, provided it is willing to restrict itself in the matter of consumption, and this very restriction, consequently, as we have repeatedly explained in the past, not only brings out the all-round merits of the competing cars, but also puts a considerable premium on skill and judgment in the management of the cars during the race. The event, owing to this very restriction, is certain to bring to light a quantity of suggestive data of value and use to everyone interested in the development of automobilism. That the results of fuel restriction on the running of cars on ordinary roads and hills are by no means foregone conclusions, is well illustrated by a number of experiments which we have conducted for some time past with some leading makes of tourist cars. These results, which we now place before our readers, will make it clear that the Tourist Trophy Competition will be a highly interesting one from every point of view, since there will be a magnificent sporting element that should prove highly attractive to the general public, as well as an invaluable indication of car-value for the prospective purchaser.

A variety of interesting and highly suggestive considerations emerge from our experiments. But the general reader need not go into them any further than he likes. The results are all put together in an easily comprehensible table, of which the first and fourth

columns alone need be consulted by those who merely desire to get a cursory view of the comparative results. Those who wish to go further into a very fascinating subject (and the number of those who are likely to do so is growing rapidly), will be able to consult our explanation and commentary on the table next week.

The article, of which we give the first portion in this issue, is therefore intended equally for the cursory reader, the ardent motorist, and the more determined student of the problem of present and future tourist-car racing on "T.T." lines, and will, we trust, increase the interest with which all will either watch the race, or, if they are not present on the course, subsequently read about it.

Royal Commission on the Motor Car Acts.—The full list of the members of the Commission is now announced as follows:—Viscount Selby, the Marquis of Winchester, Sir D. Harrel, Sir W. B. Forwood, Mr. E. R. Henry, Mr. W. J. Mure, and Mr. C. Monro. Captain C. Clive Bigham has been appointed secretary to the Commission. Sir D. Harrel, representing Ireland, is the only new name added since our first announcement on August 12th.

Employers' Competent Drivers' League.—We are glad to find that the action of the Automobile Club, in regard to organising examinations and giving certificates to competent drivers, has received the recognition and adherence of one, at any rate, of our most important automobile firms. Messrs. Jarrott and Letts, Ltd., write to inform us that they think the scheme of the Club should receive whole-hearted support, that they now make it a *sine qua non* that all their employees, whose business it is to drive cars, should pass the examination and obtain the club-driving certificates. With a spirit of marked generosity, Messrs. Jarrott and Letts are themselves paying the fees charged by the Club, while, in addition, they make it a rule never to recommend a driver to a client or purchaser of any of their cars unless he has obtained, and still holds, the Club certificate. Messrs. Jarrott and Letts are undoubtedly doing the right thing in adopting this course of action, and we hope before long to see all the principal manufacturers in the kingdom adopting a similar line, at least for a time. This will go further towards solving the driver problem and getting rid of that bugbear of our roads, the reckless driver who violates all the canons of good "road feeling" when out by himself, than anything else can do.

"ARISING out of this" we are decidedly sorry to find the *Spectator*, in an article which we are reluctantly compelled to admit is witty and amusing reading, making fun of the "Industrious Chauffeur." The industrious chauffeur, according to the *Spectator*, is a most charming person to have in your employment. He is willing to go to any amount of personal sacrifice and inconvenience to keep your car running (being an enthusiast), is always amenable to suggestions, and generally delightful. But he is said to be dogged by misfortune, and generally forgets some element indispensable to the success of a run, and usually has more accidents happen to him than his wicked and unregenerate brother who cares nought for his employer's interests, spends his employer's money like water, and ramps along the roads when he has a chance, to the terror of everybody.

OUR CANALS AND MOTOR BOATING.

(Continued.)

OUR CANALS.—A lock-keeper's house near Brookwood.

OUR CANALS.—The Basingstoke Canal, where it crosses over the London and South-Western Railway, near Aldershot (Frimley).

OUR CANALS.—An overgrown shady spot en route.

MR. CARTER, who has purchased the canal, has announced that he intends experimenting in this direction. There are some difficulties which he will have to encounter. Altogether the canal contains just over thirty locks. These are situated to some extent in bunches. There are two on the Wey Canal (the Wey Navigation Canal is its official title) before its juncture with the Basingstoke Canal, is reached, and then there are some twenty-nine on the Basingstoke Canal itself. It is estimated that by deepening the canal (its maximum depth at present is about five feet and its minimum in the middle about four when the reaches are all full of water) would enable the number of locks to be reduced by something between one third and one half. This would, of course, be an expensive proceeding, but considering the amount of time involved in passing through locks and the expenses also necessary for lock maintenance, it would probably prove a wise policy to adopt, and would certainly have the effect of increasing the attractions of the canal for motor-boatists coming up from the Thames.

The supply of water to the canal is another question which will have to be seriously considered. For some considerable time past, during very dry summers, the supply has been apparently inadequate, and many of the reaches have sunk so as to be imperfectly navigable. This is due to two causes. Some years ago what were assumed to be improvements were carried out by an engineer who was not fully familiar with canal practice. Some alterations were made in one of the upper reaches and the bottom of the canal was not adequately puddled. There has resulted here a very considerable leak, which has been the cause of much waste of water. It will certainly be essential to thoroughly puddle the bottom at this

point so as to stop leakage. There are a certain number of springs in the course of the canal which provide some of the water with which it is fed. But the original design was to rely upon a large and very opulent spring at Basingstoke, in connection with which a large pumping engine was established for pumping water into the canal. The supply of this spring is probably quite equal to the requirements of the canal, as the pumping engine has been run for a considerable period of weeks (at the time when the late canal company was in a position to run it) keeping the supply of the canal fully adequate, and the spring displayed no symptoms of exhaustion. With capital to improve or keep the pumping station in full action, therefore, there are good grounds for believing that the water supply would be adequate.

For the present owner of the canal therefore to successfully establish a regular motor boat passenger and goods delivery service, which would be a great boon to the district, it will be necessary probably for him in the first case to consider the question of water supply, and to decide how far it will prove adequate, while the next important point is to fully weigh the expense involved in deepening the canal, with a view to eliminating as many as possible of the existing locks.

(To be continued.)

THE Panhard and Levassor self-propelled workshop (a description of which appeared in our last issue), will, we understand, be in the Northampton district from September 8th. The headquarters will be the Plough Hotel, Bridge Street.

OUR CANALS.—On the Wey Navigation Canal, just above where the Basingstoke Canal turns off.

SPEED INDICATORS FOR AUTOMOBILES.—PART VI.

THE SOAR SPEED INDICATOR AND RECORDER.

THERE are but very few instruments at present on the market which, in addition to showing the actual speed of the car at all times, make a permanent record of the day's run, from which the actual velocity of the car at any particular spot and the variations in speed from mile to mile can afterwards be ascertained. Obviously a speed indicator forms an essential part of any speed recorder, and the chief difference between the two instruments is that the latter has a stylus or pencil instead of the pointer, which, in the former, indicates the speed by moving over a dial. Such a stylus will trace a line representing variations of speed, and the piece of paper on which the record is thus drawn is usually "calibrated," so that the speed in miles per hour can be read off direct.

Of such recorders there are two distinct types, viz., that in which the paper is moved by clockwork, and that in which the necessary motion is derived from some revolving portion of the propelling mechanism on the car itself. The result in the first case is to enable the speed at any particular time during the day to be afterwards seen, but, in the other case, *distance* instead of time forms the basis of the record. With either type of instrument a certain amount of calculation is necessary before the speed at any particular spot can be ascertained, but, of the two, the clockwork mechanism involves by far the greater labour.

The Soar recording mechanism is of that type which refers to distance instead of time. It is contained in the same case, and is operated by the same mechanism as is the speed-indicator proper. Fig. 16 includes two different views of the Soar speed-indicator complete, and also shows the mechanism removed from its case. In Fig. 17, larger views of the more important parts are given. It will be noticed that the speed-indicator belongs to the mechanical variety, and depends on the action of a centrifugal governor, in a similar manner to other instruments of the same class already described.

All the mechanism is enclosed in a cylindrical case, A, the lower part of which is enlarged to accommodate the rotating governor balls, C. About midway up the case is the dial, A¹, of the speed-indicator proper, above this, inside the case, is the recording gear, while at the top of the case there is another dial, A², which forms a mileage recorder. The mechanism is operated, in the usual way, by a flexible shaft which communicates with the front road wheels of the car.

The Speed Indicator.

One end of this flexible shaft is connected to the spindle, B, which passes up vertically into the case, A. Mounted on the spindle, B, are leaf-springs, C², which carry the governor balls, C. The governor balls, C, are connected, by the flexible steel-strips, C¹, with the guide-block, C⁴, which is free to slide up and down the spindle, B. The radial motion of the governor balls, C, therefore, causes a vertical motion of the guide-block, C⁴, and this in turn is made to give a rotary motion to the pointer on the dial, A¹. In order to make all the divisions on the dial more nearly equal to one

another for equal variations of speed (for they tend to get larger and larger as the speed of the car increases), an additional pair of helical springs, C³, has been provided, and these only come into action when the speed of the car exceeds a certain rate. By suitably proportioning the leaf and the helical springs it is possible to make all the divisions on the dial quite distinct, and to obtain at the same time a comparatively long range.

The connection between the guide-block, C⁴, and the pointer, F, on the dial, A¹, is made in the following manner. The upper end of the spindle, B, is hollow to receive a rod, D, and the guide-block, C⁴, is fixed to the lower end, D¹, of the rod, D, by a pin which passes through a vertical slot in the spindle, B. The vertical motion of the guide-block, C⁴, is thus directly communicated to the rod, D, which in turn converts it into a rotary motion of the spur-wheel, E,—carried in brackets on the stationary-plate, A³—by means of the rack, D², formed on the rod, D. The spindle of the gear-wheel, E, is geared to the spindle of the pointer, F, by the wheels, E¹ and F¹, this being done in order to enable the dial to be placed centrally in the side of the case, A.

The "Maximum Speed" Pointer.

In connection with the dial, A¹, is a maximum speed indicator, which consists of a supplementary pointer which remains stationary at the maximum speed that has been attained. The method of operating this needle is similar to that adopted in the "Smith" Speedometer already described, and a button, K, is provided for releasing the needle and enabling it to instantly fly back to zero, or to such other position as corresponds with that of the pointer proper.

Although the foregoing description applies to the speed indicating mechanism in particular, yet, on account of the inter-connection which exists between certain parts of the indicating and of the recording mechanisms, the apparatus

must essentially be considered as a whole. There are, in fact, certain details in the speed indicating mechanism that are less simple than they otherwise would be, for it has been necessary to modify their design in order to simplify the general arrangement in its entirety.

The Speed Recorder.

The speed recording mechanism—of which the principal members are indicated by the letters, D, G, and H, is mounted above the fixed plate, A². Its duty is to draw a line on a stationary sheet of paper that is placed round the inside surface of the case, A, the pencil being made to move slowly round over the paper, so that its position at all times corresponds with the distance covered by the car, and to move up and down across the paper, so that the vertical position of the line drawn by it will indicate the speed of the car in miles per hour.

The vertical motion of the pencil is obtained by connecting it to the guide-block, C⁴, on the spindle, B, so that this movement bears a direct relationship to the speed of the car. The horizontal travel of the pencil is obtained by bodily rotating the framework that carries it, and for this purpose the framework is geared to the

Fig. 16.—The Soar Speed Indicator and Recorder. View showing the instrument complete (on the right and left) and the interior mechanism (in the centre).

spindle, B, this causing it to rotate proportionally to the actual distance covered by the vehicle.

The pencil, H, is carried in a holder, H¹, which slides in a slot cut in the tube, G², and the holder is connected, on the inside of the tube, G², to a guide-tube, H² (Fig. 17), which serves to keep it steady. This guide-tube, H², would be connected directly to the rod, D, but for the fact that the range of motion in the rod, D, is so short as to make small speed variations hardly distinguishable. In order to remedy this, therefore, a simple rack-and-pinion gear is introduced, which cause the vertical motion of the pencil to be multiplied. For this purpose the guide, H², is fitted with a single rack, H³, and a double rack, G³, is fixed, opposite to it, on the

H3

32

J4

Fig. 17.—The Soar Speed Indicator and Recorder. View showing the more important parts of the mechanism.

inside of the tube, G². The end of the rod, D, is provided with a fork, which carries three spur-wheels, D³, D⁴, and D⁵, these three spur-wheels being fixed together. The two outer wheels are of the same size, but the wheel, D⁴, is larger. The apparatus is so made that, when the upper end of the rod, D, is in place in the interior of the tube, G², the spur-wheel, D⁴, meshes with the rack, H³, while the two wheels, D³, mesh with the double rack, G³. Any vertical motion of the rod, D, under these conditions, therefore, produces a corresponding motion of greater magnitude in the sleeve, H², and, consequently in the pencil.

The horizontal travel of the pencil is obtained, as has already been mentioned, by rotating the whole framework carrying the pencil. For this purpose the tube, G², is mounted on a turn-table, G, on the underside of which is fixed a large spur-wheel, G¹. The

Fig. 18.—Diagram of a chart obtained from the Soar Speed Recorder. No record is made below 5 m.p.h. The above chart shows that the car attained a speed of about 18 m.p.h. (b) after it had travelled about 2 miles, it then slowed down to about 6½ m.p.h. (c) and again accelerated to about 13 m.p.h., and so on. The car slowed right down (e) five times in the run of 50 miles, and twice (f) and (g) exceeded a speed of 30 m.p.h., the highest speed (g) of about 35 m.p.h. being reached when the car had gone 48 miles.

wheel, G¹, meshes with a very small pinion, B⁵, which is carried by a bracket on the stationary plate, A³. This pinion, B⁵, is driven by a train of skew gears, B³, B⁴, and B⁵, from the worm-wheel, B², which intermeshes with the worm, B¹, on the end of the spindle, B.

The Mileage Recorder.

The top of the tube, G², is frictionally connected to the spindle of a pointer which moves over the face of the dial, A², on the cap of the case, A. This dial, A², is calibrated to show the mileage covered, and it serves as an external indication of the position of the pencil, H, and to show when a new record-paper is needed. The record is easily removed from the case, A, after lifting the cap, A², and the pressure of the pencil against the paper is also very simply adjusted by tightening a spring that is enclosed in the tube which holds the lead pencil.

The Alarm Bell.

In addition to these numerous duties, the mechanism performs one other function, viz., to ring the bell, L—mounted on the back of the case, A—when the car has attained a certain predetermined speed. This simple operation is performed by a projecting arm, fixed to the sliding-block, C⁴, which strikes the bell so soon as its height corresponds with that of a projecting portion of the bell-hammer. The bell is mounted in a slide to render it adjustable, and the screw, L¹, is provided for raising or lowering it, a scale, L², being marked on the case, A, to enable the alarm to be "set" for any desired speed.

Table of Reference Letters for the Soar Speed Indicator.

A Case.	E Spur-wheel in mesh with D ³ .
A ¹ Speed indicator dial.	F ¹ Spur-wheel driven by E.
A ² Mileage recorder dial.	F ² Speed indicator pointer.
A ³ Bracket carrying mechanism.	F ³ Pinion on spindle of F.
B Driving spindle.	G Plate carrying speed recorder gear.
B ¹ Worm on end of B.	G ¹ Large spur-wheel on G.
B ² Worm wheel driven by B ¹ .	G ² Guide for speed recorder.
B ³ , B ⁴ , B ⁵ . Skew gears.	G ³ Toothed rack fixed inside G ² .
B ⁶ Pinion driving speed recorder.	H Speed recorder pencil.
C Governor balls.	H ¹ Clip carrying H.
C ¹ , C ² , C ³ Governor springs.	H ² Tube carrying H ¹ .
C ⁴ Sliding block coupled to D ¹ .	H ³ Toothed rack fixed to H ² .
D Spindle operated by C.	K Button for releasing maximum speed indicator.
D ¹ Swivel joint on D.	L Alarm bell.
D ² Teeth on D.	L ¹ Adjustment for L.
D ³ Fork on upper end of D.	L ² Scale for setting L.
D ⁴ Large pinion carried by D ³ .	
D ⁵ Small pinion on D ³ .	

THE vagaries of fashionable society, at any rate in America, are well illustrated by a report which has found general publication in this country, that at a large ball a special cotillion was danced by the guests in motor car goggles and masks. The reports

do not state that anything else was worn, though this is doubtless an omission, but in any case the employment of motor goggles as an adornment is sufficiently ludicrous, and not calculated to make converts to automobilism.

"MERRYWEATHER" SELF-PROPELLED FIRE-ENGINES.

Two views of the 30-h.p. Petrol Fire Engine built by Messrs. Merryweather and Sons for the Sydney Metropolitan Fire Brigade.

As our readers are already aware, considerable attention has, for some time, been given by Messrs. Merryweather and Sons to the construction of self-propelled fire-engines of various kinds, and this firm have, during the past few years, supplied quite a number to those municipal bodies and others, who—like themselves—are sufficiently up-to-date to take advantage of the progress of the day. Illustrations of some of these machines, including those propelled by steam and those driven by petrol engines, have from time to time appeared in our columns, and it needs but a glance at these to show how rapid has been the development that has taken place, and how successful these celebrated engineers have been in their endeavours to render fire-engines thoroughly mobile and speedy. Nobody knows better than they how important are the first few minutes when a fire has broken out, and it is a matter of congratulation to all that they were so quick to realise that for fire-engines, even more perhaps than for any other type of vehicle, modern automobile machinery, and the high speed rendered possible by it, are indeed valuable allies.

We are now able to give two views of one of their latest 30-h.p. petrol-driven "engines," and also an illustration of a "steamer," which has recently been delivered to the Norwich Union Fire Insurance Society for use at Worcester. The former has been shipped to New South Wales for the Sydney Metropolitan Fire

Brigade, who have had a 20-h.p. "Merryweather," petrol-driven, chemical engine in use for some time; it will, we believe, be the first self-propelled fire-engine proper in Australia.

The propelling mechanism is arranged in much the same way as on an ordinary petrol car of the chain-driven type, with the four-cylinder engine beneath the bonnet, with a leather-faced cone clutch in the flywheel, and with a change-speed-gear of the sliding spur-wheel pattern giving three forward speeds and a "reverse." The fire-pump is of the three-cylinder "Hatfield" type, is made of gun-metal with rubber disc-valves and has copper air-vessels. It is fixed, as seen, at the rear, where it is driven from the gear-box through a sliding clutch—another clutch being employed for simultaneously disengaging the gear-shaft from the propelling mechanism. The pump capacity is 300 galls. per min.; a single jet can be thrown to a height of 140 feet, or four smaller jets can be used simultaneously instead.

For keeping the motor cool, when it is necessary to run it for long periods at fires, provision is made by which part of the water delivered by the fire-pump can be forced through the cylinder-jackets. Seats for the men are formed on the large hose-box, and the vehicle has extremely powerful hand and foot brakes.

The "steamer" shown in our third illustration is fitted with a special type of burner, that has been developed by

The "Merryweather" self-propelled "steamer," supplied to the Norwich Union Fire Insurance Society for use at Worcester.

Messrs. Merryweather themselves. It burns common paraffin oil, which is converted into a fine spray by a jet of steam. In this machine, also, the fire-pump (which is driven by the same engine that at other times propels the "engine") is made use of to automatically maintain the water supply, for the water tanks are fitted with ball-cocks that have the effect of always keeping them full from the delivery pipe; water can even be forced direct

The Legislation Fund of the Joint Committee of the A.C.G.B.I. and the Motor Union.—We are glad to be able to announce that the Society of Motor Manufacturers and Traders have made a generous donation of £500 to this fund, the total amount of which now stands at upwards of £1,600.

Messrs. Jarrott and Letts also have forwarded to the Joint Committee a handsome subscription of 50 guineas, in informing us of which Mr. Charles Jarrott makes the following observations, which, as they sum up the situation in regard to the Joint Committee and the absolute necessity of its being amply provided with funds in the most terse and convincing manner, we herewith append in full:—

"My company has this week forwarded to the Legislative Defence Fund formed by the Automobile Club and Motor Union a donation to assist in carrying out the object which all of us have so much at heart at the present moment, namely, the placing before the Royal Commission of a strong case for the purpose of securing fair and just regulations for motor users in connection with the new Act.

"I do not know whether other firms in the industry quite appreciate the great importance of this, but, in any event, I think it is a matter which should be forced home on every possible occasion.

"The work which has to be done is an expensive work, and a large sum of money will be necessary. The only way in which the programme can be carried out is to provide those gentlemen who are devoting all their energies to the work with the necessary funds to enable a successful issue to be obtained.

"The matter, of course, concerns the industry even more than it concerns the private user, and although I have no doubt that the fund will receive very large support from private owners of cars, nevertheless I would, as one being largely financially interested in the industry myself, like to bring home to my colleagues the necessity for supporting the Club and Motor Union Joint Committee financially to enable them to carry out this very vital work."

The Law Costs Iniquity.—The refusal of magistrates to give costs against the police or other public authorities, even when the latter are utterly and completely, according to the magistrate's own admission, in the wrong, really amounts to a serious scandal. It is one of the points on which we have repeatedly insisted legislative reform is badly needed, and will, it is to be hoped, be forcibly brought before the Royal Commission. Costs ought to follow the event without any respect of persons, for this, after all, is the only effective method of putting a limit to unjustifiable prosecutions, amounting as they often do to real persecution. These observations are suggested by the case of Mr. Macdonald, to which Mr. S. F. Edge has drawn our attention. On the 21st of last month he received a summons charging him "That he did on the 27th day of June, 1905, use on the highway—to wit, Regent Street—a locomotive then in charge of one George Candy, which did not then consume, as far as practicable, its own smoke. Whereby you have made yourself liable to the penalty prescribed by the Statute in that case made and provided." The prosecution was undertaken by the London County Council, and the defence was absolutely successful, it being maintained that the

into the boiler from the fire-pump, if desired. Another important point about these Merryweather fire-engines is that careful study has been given to the distribution of the weight upon the frame and the wheels; thus, for instance, it will be seen that the boiler lies in front of the back-axle, instead of being allowed to overhang—as on ordinary "fire-engines"—behind.

Highways Act under which the summons was taken out did not apply at all, and that the summons, if any, ought to have been taken out under another Act. In addition, it was maintained that the car was so constructed as to consume its own smoke, and that its emission was due to an accidental cause; while last, but not least, *the defendant was away at Kiel when the offence was stated to have been committed*, and was not in any way responsible. After this defence the County Council, perforce, withdrew its summons, with the magistrate's permission, as he stated that he could not possibly convict in view of the legal contentions put forward. It can hardly be believed, however, that he refused to give costs to the successful defendant, on the ground that the County Council were only doing their duty. Needless to say, this is a great hardship to Mr. Macdonald, as he had to employ expensive legal assistance to defend him, and, in addition, had to return from Wales to London at further expense and inconvenience, because the London County Council solicitors had made a mistake. When magistrates thus exercise their discretion in regard to costs it is high time, as we have contended above, that that discretion should be withdrawn.

Damage to Roads.—The Lunesdale Rural Council—we are not quite sure where Lunesdale is, and probably most of our readers do not know either—has been memorialising the surveyors of roads in Lancashire and Yorkshire to ascertain their views as to whether motor cars injure roads or not. Whether the Lunesdale Rural Council (we make no comparison with the celebrated tailors of Tooley Street) explained to the surveyors that an adverse opinion would be preferred, or whether they only wrote to those surveyors whose adverse opinions were already known, the result is that without an exception all the replies, at any rate those published, are to the effect that motor cars do a considerable amount of damage. The opinions of well-known surveyors that we have given in this Journal from time to time in the past have been quite different, and it is interesting, therefore, also to be able to quote the views of Mr. B. S. Newcombe, surveyor of Warrington, who writes as follows:—

"I have gone very deeply into the motor car question from all points of view, and I am becoming strongly of the opinion every day that they do not do anything like the damage attributed to them. There is no doubt they do raise the chippings and blindings in dry weather, but in ordinary weather they do absolutely no damage, and cause no wear. I would suggest this:—Is not a car (probably owned by someone paying big rates and big income tax) entitled to an amount of wear equal to an iron-tired vehicle? I think so, and I think that, taking the year round, they do less damage than the average omnibus or conveyance carrying the same number of passengers."

In addition Mr. Newcombe declares that any injury that motor cars do is to the surface of the road merely. They do not have any prejudicial effect on the lower layers of road metal, and it is the underlying portion of the road material that, in his view, is most destroyed by iron-shod wheels and horse traffic.

THE 40-50-H.P. RICHARD-BRASIER CAR.—PART III.

Fig. 7.—The Richard-Brasier Carburettor. Views from each side, and separate view of some of the chief parts.

The Lubricator.

AN entirely automatic system ensures the proper lubrication of the engine at all times. The lubricator, which is fixed centrally on the dashboard (Fig. 4), contains five independent pumps, which make their suction strokes under the action of springs, and are operated, as regards their delivery strokes, by small eccentrics. Adjustments are provided for each pump, and the shaft carrying the five eccentrics is driven at a slow speed by means of worm-gearing; the necessary connection with the engine is made by neatly-enclosed bevel-gearing, as seen in Figs. 5 and 6. By this means, the feed of oil to the engine is proportional to the speed, and a positive delivery is ensured to each part. The oil is led to the crank-chamber, the pistons, and the cam shafts. There are also wick-feed oil-cups formed in the crank chamber-casting above the main bearings for the crank-shaft.

The Carburettor.

In Fig. 7, the carburettor is shown from both sides, and other views are also given of certain parts detached. It is formed by two main castings, which can readily be fixed together or detached by means of the two swing bolts, H'. The lower casting constitutes the float-feed-chamber, G, and that portion (H) of the mixing-chamber which contains the two spray-jets, while the upper casting, F, forms the water-jacketted mixing-chamber proper, as well as the throttle-valve.

The petrol-pipe is attached to the carburettor above the float-feed chamber, and the petrol is previously led through a special filter that is visible in Fig. 4, while the "agitator," G¹—for "flooding" the carburettor when starting—is so arranged in conjunction with the lever, G², and an operating rod (not shown), that it can be depressed from the front of the car. The object of employing two jets instead of one is that by this means the petrol is broken up into a spray immediately it leaves the

jets, owing to the action of the two streams impinging on one another. For this reason the two jets are fixed opposite to one another, and both are set at an angle.

The main air-supply enters the base of the mixing-chamber, being led from the neighbourhood of one of the exhaust-pipes by a pipe passing across beneath the engine, and the whole of this partly-warmed air flows up around the jets. Into the mixing-chamber proper—inside the casting, F—an auxiliary air supply is drawn by the engine when the suction produced by it is sufficient, this auxiliary air entering through a spring-controlled valve in the fitting, J. The amount of air so entering varies in accordance with the speed of the engine and the load, and an approximately constant richness is maintained in consequence. Instead of allowing the auxiliary air to enter through one large passage into the mixing-chamber, a large number of small radial tubes are fitted through the wall of that chamber, and so the air is thoroughly well mixed with the already richly-carburetted air, and a homogeneous explosive charge results. The automatic valve is prevented from "hunting" or chattering by a dash-pot device, consisting of a small piston, J¹, fixed to the valve stem, and a corresponding cylinder formed inside the cover, J²; a small hole in the top of the cover, J², prevents the air that forms a cushion above the piston, J¹, from entering or escaping too rapidly.

There is nothing unusual about the throttle-valve itself, for it is merely formed by a sleeve that has a semi-rotary movement and has large ports cut in its walls to allow the mixture to pass, at any desired rate, to the induction-pipes, F³. The whole of the casting, F, is, as will be seen, provided with a water-jacket—to prevent the petrol spray from condensing or freezing in cold weather—the pipes connecting it with the circulating system being coupled up to the union fittings, F² and F³.

Conclusion.

From the foregoing description, it will have been gathered that the new 40-50-h.p. Richard-Brasier chassis is an excellent example of first-class design and up-to-date construction. Our photographs moreover will have conveyed the impression that in spite of the high power that is available, there is nothing in its

Useful Tools for Motorists.—Nothing contributes so much to alleviate the aggravation of making an adjustment or repair *en route* as the possession of tools specially designed for their work, and it is but too often the case that a motorist's tool kit contains but the meanest selection of really handy instruments. Nowadays, all the best known tool makers stock innumerable small instruments which, although not specially designed for motorists, are in many instances just the very thing a motorist requires. Foremost among such firms is the old-established house of Melhuish and Sons, whose well-known premises in Fetter Lane rank among the oldest buildings in London. Although old-established, however, there is nothing conservative in their attitude towards innovations, and while keeping thoroughly up-to-date they ensure satisfaction to their customers by a thorough system of testing which enables them to sell such tools with a full knowledge of their strength and quality.

Our illustration shows a small collection of handy tools which we have received from Messrs. Melhuish, each of which has merits peculiar to itself, and none of which are usually found in a motorist's tool kit. Although all of them are not novel in the sense of being recent inventions, our readers will doubtless be glad to have their attention directed to such instruments if they have not hitherto known of their existence.

The peculiarity of the pliers, A, is the extreme thinness of the jaws, which enables them to be used in places where an ordinary blunt-nosed tool would be useless. The screw-driver, B, speaks for itself, it is a

general appearance to denote its speed capabilities—in other words, there is absolutely nothing of the racing “freak” about it, although it so closely follows the lines of Théry's celebrated Gordon-Bennett racer. It therefore only remains to be said that the workmanship and materials are apparently all that could be desired, and are well calculated to maintain the high reputation already won by the firm.

pocket instrument, and has four different sized blades. One drawback to many instruments of this type is the weakness of the fastening between the tool and the handle, but in that illustrated it will be noticed that the steel bolt, B¹, registers into the hole, B², and amply sufficient rigidity is also obtained from the length of the tubular shaft, B³. Altogether this little tool is particularly handy for the pocket, and it is very well made, the tips of the blades being hollow-ground, which is an important point in screw-drivers.

Another screw-driver, C, is shown on the right of the illustration, and this is a recent invention of Mr. Melhuish's. It often happens that a screw is in such an awkward position that it is almost impossible to keep the screw-driver from slipping. To prevent this occurring the blade of the screw-driver illustrated is made with flanges or shrouds, C¹, which not only keep it on the screw but considerably strengthen it as well. The shape of the handle is also worthy of notice, as it indicates the really correct method of holding the instrument.

The pliers, D, are peculiar in that their jaws always keep parallel—an advantage which anyone who has attempted to hold a piece of sheet metal with an ordinary pair of pliers will readily appreciate.

A VERY racy article is contributed to the *Badminton Magazine* by Major C. G. Matson. The article is an appeal to the inconsiderate motorist to recognise the dictates of common-sense as well as those of good nature and common courtesy to other users of the road, and it comes therefore at a very appropriate moment in the development of the motor car movement. The whole of Major Matson's article is entertaining, but as an example of its quality we confine ourselves to the two following passages, which are characteristic both of his attitude and his style:—

“The man who owns a vehicle capable of going as fast as a railway train will more than probably be tempted at times to drive it at its full speed, or if not his chauffeur will, to the general discomfort of the public. *Why go ‘scorching’ along the roads?* To say nothing of the danger, the blinding clouds of dust raised are in proportion to the speed attained, and a car running at forty miles an hour on a calm day will leave a trail of dust quite a mile long in its wake to ruin the clothes, property, and temper of everyone within reach. *Why be such a selfish wretch? Go slow.* Proceed at half the speed, except in absolutely deserted country. At fifteen miles an hour but little dust is raised, and in passing pedestrians, horse traffic, and cyclists, any decently-minded driver should slow down so as to inconvenience them as little as possible. It is difficult to get these notions into the head of the professional driver. His idea of horse-power is to use it at all hazards, to ‘show off’ generally as much as possible.”

“Another of the unwritten laws is that at elections one's motor car is to be at the disposal of one of the candidates as a matter of course. Well, all I can say is that no prospective legislator sees me burn any petrol on his behalf unless he is sound on the Motor Question, and with me ‘soundness’ means ‘the high road for everybody, and not only for Herr von Hoggeneimer and his congeners.’ I think it is a mistake to have any speed limit. Because it is lawful *sometimes* to drive at twenty miles, it has almost become an unwritten law to drive at that rate (or a little over it) whenever possible.”

THE TOURIST TROPHY RACE.

Photo by G. C. Cowen, Ramsey.

TOURIST TROPHY RACE IN THE ISLE OF MAN.—The course near Douglas. Taken from Kepple Gate.

The official headquarters are at the Peveril Hotel, Douglas.

Entered cars must be in the Isle of Man at 10 a.m. on Monday, September 11th, for examination and weighing up. After entering the official enclosure the cars will remain under the sole control of the club till the start of the race, and they will not be available for timing up, adjustment, or any other purpose until the morning of the race, and then only under supervision.

NOTES FOR THE PUBLIC.

Cars will start at 9 a.m., at intervals of two minutes, from Quarter Bridge, on Thursday, September 14th.

Four complete circuits of the course (52 miles 1 furlong) will be made, this being a total distance of 208 miles 4 furlongs.

There will be no controls.

All cars must carry the same "load" (including the body), irrespective of horsepower or size.

The car covering the full course in the shortest time is the winner.

Each car will be allowed a limited and identical supply of petrol, sufficient, in the opinion of the judges, to cover the full course at a reasonable speed. If the course were over the Oxford road, each would

have one gallon for every 25 miles. In the Isle of Man they will have what the A.C.G.B.I. officials consider to be an equivalent quantity, after taking into consideration the actual state of the roads at the time and the hilly nature of the course.

How this fuel limitation will affect the driving of the cars and call out the best and most skilful manipulation to win the race we explain elsewhere.

If all the cars not hitherto withdrawn actually start there will be 47 competitors, the last car would in that case leave Quarter Bridge on its first round at 10.34 a.m.

TOURIST TROPHY RACE.—The 14-h.p. Wolseley Car, which is of the same type as all those which have established for themselves a world-wide reputation.

50	1																								

Extremely wide is the range of cars entered, but every necessary factor for enabling spectators to make an intelligent comparison between the cars is included in our table, which is published elsewhere in this issue.

The most costly car is the Napier, the lowest-priced is the Cadillac; both are in the first rank of their respective types, and the mere fact that both are competing in the same event, with the same "load" and the same quantity of fuel, is sufficient proof of how wide is the circle of motorists to which the T.T. should appeal.

Many of the cars entered are ordinary standard models; some makers intend to adopt their T.T. car as a new standard type, and such cars will doubtless figure largely at the next exhibitions—which is another reason why motorists should interest themselves in the event.

EXPLANATION OF TABLE.

Engine.—Type: V = Vertical; H = Horizontal.

Cyls.: c = Compound; da = double acting.

Control: G = Automatic Governor; T = Independent hand throttle; L = Variable left inlet valves.

Ignition: B = Battery; M = Low-tension magneto; m = high-tension magneto.

Carburettor.—Control: A = Automatic regulation for richness of mixture; D = Richness regulated by driver; F = Fixed, i.e., no compensation for richness.

Feed: pr = Pressure; gr = Gravity.

Gauge: ga = Gauge; fl = Float.

Transmission.—Type: cc = Side-Chains; c = Single Chain; la = Live Axle.

Clutch: co = Cone; mc = Metal Cone; di = Disc.

"Direct" drive on which speed.

Tyres.—Make: Du = Dunlop, Mi = Michelin, Pa = Palmer, Ct = Continental.

* At normal engine speed.

‡ Vauxhall car 35½ m.p.h. at 1 speed. The values for piston per mile are 16c respectively.

† Suction strokes only are calculated in this column, so that on the basis established from the results of the Small Car Trials (AUTOMOTOR JOURNAL, September 17th, 1904, page 1106) the present *effective* piston displacement of 5,000 cubic inches per minute is approximately equivalent to 1-h.p.

Where spaces in the above table are unoccupied, it signifies that the information is not available. Where dashes are employed, it indicates that the question does not apply.

THE special article which we devoted to this subject in July last was more particularly intended to lay

TOURIST TROPHY RACE.—Side view of the 18-h.p. Napier chassis. Atmospheric inlet-valves of the Napier "multiple" type will be employed during the race instead of the mechanically-operated, annular valves fitted to the 4-cylinder engine of the standard chassis; the general design permits either to be used as desired.

before our readers the principles upon which this novel type of contest—the Tourist Trophy race—had been based, and to bring before their notice the difficulties that are necessarily experienced when attempting to institute any really satisfactory competitive event for *touring* cars. With this object in view, we analysed the general question in some detail, and not only tried to show how far it was possible, on the lines adopted by the A.C.G.B.I., to put a premium on all the most desirable characteristics of such vehicles, but we also considered various alternative methods that had been suggested, in the hope of attaining the same end. Our conclusions were (1) that the adoption of "fuel consumption per mile" for limiting engine power was the best basis; (2) that this method of classification had quite the desired effect—when taken in conjunction with a specified weight for the car—of restricting car speed; (3) that it—unlike any of the other alternatives—tended to ensure touring conditions being adhered to by the drivers; but (4) that certain modifications might to advantage be made in the present T.T. rules after the race had taken place this year.

TOURIST TROPHY RACE.—View from above of the Napier chassis, showing the three-point-suspension, 4-speed gear-box which "floats" on the differential countershaft. The conical steering-wheel is a distinctive external feature of the two Napier cars.

TOURIST TROPHY RACE.—Side view of the Thornycroft chassis. The engine is an entirely new model, having all the valves arranged on the top of the cylinders where they are extremely accessible, and the cam-shaft, which is on a level with the cylinder heads, is driven by bevel-gearing from a vertical shaft.

We gave our reasons for believing that a good working basis had been arrived at for holding a rational type of automobile contest, which would not only have all the attractive features of an ordinary race, but would cease to be the mere "speed-contest" between racing machines that all such competitions have necessarily resolved themselves into in the past. And we also showed that such a contest would further gain an immense advantage by possessing the true sporting interest resulting from the subservience of sheer mechanical power to the highest form of skilful driving and to all the best features of touring car design. As strong reasons for advocating the underlying principles of the Tourist Trophy race, we, in fact, urged the interesting nature of such events from

TOURIST TROPHY RACE.—Another side view of the Thornycroft chassis which, except for the new 4-cyl., 14-h.p. engine, follows the lines of their well-known standard 20-h.p. model.

a spectacular point of view, the real value they should have in guiding the buying public, and the benefits that would accrue to the industry at large by the tendency towards standardisation of types that would result.

Even at the time, however, we could not but realise that the chief difficulty in the way of convincing motorists of the merits of the new system lay in the absence of such practical data as was needed for showing by actual figures the extent to which the desired results would be obtained, and

it was also anticipated, as has since proved to be the case, that the very valuable communications which have since then appeared, week by week, in our columns, would be similarly restricted in their scope to a purely abstract consideration of this very important subject. We, therefore, commenced making a number of trials with some of the best known cars on the market, and have also obtained some very interesting figures from bench tests with typical petrol engines. It is with great pleasure that we now publish the

TOURIST TROPHY RACE.—View from above of the Wolseley chassis, showing the well-known, but unique, arrangement of engine and gear-box, which lie parallel to one another across the frame and are connected by a Renold's "silent" chain.

bring out prominently the great need that there is for certain modifications to be made, for future occasions, in the existing rules.

Our Practical Tests— Results.

The main object with which these private tests have been conducted was to ascertain, in a general kind of way, the extent to which the fuel consumption is affected by car-speed, by engine-speed, and by different methods of control on

TOURIST TROPHY RACE.—The Whitlock-Aster Car, which is of the live-axle type and has a gear-box giving three forward speeds and a reverse.

more important results. Although they have extended over a considerable period, and have naturally involved a great deal of careful study, we do not for a moment pretend that they more than touch upon the fringe of what is unquestionably a very vast and complex subject, but we, nevertheless, believe that they will at least show how much more importance is automatically attached to careful driving than to mere recklessness, how completely anything of the nature of a racing car is excluded from the con-

TOURIST TROPHY RACE.—Side view of the Whitlock-Aster chassis, which has a 12-h.p., four-cylinder Aster engine fitted with mechanically-operated inlet valves.

test, how great a premium is placed on efficiency of transmission, and how sound is the system of classification for a definite type of car. Our figures also

an ordinary touring car. Two things were, therefore, necessary in order to arrive at the required results, the one being a series of fuel-consumption tests with various cars on the road, and the other being bench tests with typical petrol engines in the shops. Obviously the road tests alone would extend over an extremely long period if any attempt were made to take into account all and every running condition, and even apart from the time taken in actually driving the cars and securing the records, it would be an enormous task to classify such a mass of figures and reduce them down into tabular form. To bring the work down within a practicable compass it was consequently decided to select two entirely different trial routes, and to drive each car over the same ground as many times, and

TOURIST TROPHY RACE.—The Maudslay Car, which is peculiar for having its cylinders constructed with a bore of greater diameter than the length of the stroke. It has side chains and four "speeds."

engines, but they also serve to explain the reason for many otherwise paradoxical results obtained in the road tests. The actual results of all our tests are given in a condensed form, in order to save our readers the arduous task of wading through an unmanageable mass of figures. Those referring to the road tests will be found in Table I, and those referring to the engine tests will be represented by curves in Figs. that will be numbered 1 to 8.

In connection with these tests our best thanks are due—amongst others—to Mr. J. D. Siddeley and the Wolseley Company, to Mr. S. F. Edge and the Napier firm, to Mr.

TOURIST TROPHY RACE.—One of the Swift Cars, which will be driven in the competition by Messrs. Harvey du Cros, jun. and E. de Wilton respectively. They are fitted with the well-known 4-cylinder White and Poppe engines, have four-speed gear-boxes and live axles.

at as many different speeds, as was found desirable. One of the routes was practically level and straight, the other was not only hilly, but was far from straight—having indeed numerous sharp corners, and both routes enabled the car to be brought to rest at precisely the same spot that it started, so that an accurate measurement could be made of the fuel consumed.

Our engine tests will not only be found of great value in themselves, as showing the main characteristics of modern high-speed and low-speed petrol

TOURIST TROPHY RACE.—Side view of the 20-h.p. Rolls-Royce chassis. This car, which is one of the most powerful of those entered, is virtually their standard model, but one of the two cars has a somewhat smaller engine than the other.

J. W. Stocks and the De Dion Company, to Mr. F. S. Bennett and the Cadillac firm, and to Mr. Mawdsley Brooke, of Lowestoft, for the very valuable assistance which they have afforded us. We are also indebted to Messrs. S. Smith and Sons, for their invaluable speed indicators, and to Messrs. Markt and Co. for their very effective "Veeder" tachometer.

The Road Trials.

The level course selected was slightly over ten miles in length, with a first-rate road surface, and was on most days dry. Consisting as it did of a run out and home again over the same ground, the effect

TOURIST TROPHY RACE.—View from above of the 20-h.p. Rolls-Royce chassis. A direct drive to the live-rear-axle is obtained on the third instead of the fourth gear, which latter affords a higher ratio than the corresponding top-speed of any other car in the race.

TOURIST TROPHY RACE.—One of the Minerva Cars, entered by Messrs. C. S. Rolls and Co. These vehicles are of the chain-driven type, and a direct drive to the differential countershaft is provided on the third gear although, in all, four changes of speed are provided.

of winds of varying strength on different occasions was to a great extent neutralised, but, incidentally, an excellent opportunity was afforded of seeing how greatly the speed capabilities of a car are affected by any strong head wind. The hilly course consisted of a more or less steady rise for a distance of four miles, a twisting and undulating road for another mile, a very steep descent of half a mile (during which the engine was allowed to

stand at rest), and a more or less level return to the starting point. The actual distance traversed with the engine running was eight miles, and the road surface was fair throughout. At no part was the up gradient very severe, and therefore most of the cars could traverse the entire course on the top gear, the chief advantage of the course therefore being that it enabled a nearly full load to be maintained on the engine for some time. On the level course used, full load was naturally only approached, even on the highest gear when travelling very fast, and, for the same reason, on the hilly course as well, no really useful tests could be made with any of the lowest gears.

The usual routine pursued with each car was to drive over both courses at different speeds, or, in some cases, at the same speed but using a different gear. As constant a speed as possible usually maintained, but on a few trips the speed was purposely allowed to fluctuate considerably. In this manner, we were able to obtain a widely significant range of results from which a far greater number of

TOURIST TROPHY RACE.—Side view of the Dixi chassis. The main frame is constructed of pressed steel and does not, in this respect, resemble the smaller models which are remarkable for their special tubular construction.

useful deductions can easily be made, than those which are permitted by the space at our disposal in this article. These are, therefore, available for those of our readers who have the time to study them more deeply, but we only propose in this article to draw attention to those points which are of more general interest in view of this year's race. In the table (Table I), the speed in miles per hour is given in the first column, the "gear"

TOURIST TROPHY RACE.—View from above of the Dixi chassis, showing the four-cylinder engine and the arrangement of the three-speed gear-box.

TABLE I.—(continued).

A. Speed fluctuated considerably (up to 30 m.p.h.—850 r.p.m.—at times).
 B. Speed kept down by operating clutch (governor cutting out at equivalent to 24 m.p.h.).
 C. Speed controlled by governor only (clutch not withdrawn).
 D. Speed controlled by hand throttle (compensating) only.
 E. Speed controlled by clutch and governor only.
 F. Speed controlled by exhaust-valve device.
 G. Third gear used for level portion of course.
 14-h.p. Wolseley (8.7, 15.3, 22.5 and 30.8 m.p.h. at 850 r.p.m. Bore 4½ in., stroke 5 in.). 2 cyl. (79.5 cu. in. each).
 6-h.p. Wolseley (7½, 13½, and 20½ m.p.h. at 800 r.p.m. Bore 4½ in., stroke 5 in.). 1 cyl. (79.5 cu. in.).
 15-h.p. Napier (18½, 17½, 25½, and 34½ m.p.h. at 1,200 r.p.m. Bore 3½ in., stroke 4 in.). 4 cyl. (38.48 cu. in. each).
 15-h.p. De Dion (10, 19½, and 29½ m.p.h. at 1,400 r.p.m. Bore 90, stroke 100 mm.). 4 cyl. (38.79 cu. in. each).
 6-h.p. De Dion (6, 15, and 23 m.p.h. at 1,600 r.p.m. Bore 90 mm., stroke 110 mm.). 1 cyl. (42.669 cu. in.).
 Cadillac I. (19½ and 6½ at 900 r.p.m. Bore 5 in., stroke 5 in.). 1 cyl. (98.2 cu. in.).
 Cadillac II. (23½, 15½, and 7½ at 900 r.p.m. Bore 5 in., stroke 5 in.). 1 cyl. (98.2 cu. in.).

in use is specified in the second column, the fuel consumption—actual, in miles per gallon, and in gallons per hour—follows in the next columns, and then figures are given concerning the engine revolutions, and the relationship of fuel consumption to the cylinder capacity. Practically, it may be said that the fifth and the last columns chiefly enable comparisons to be made between car and car, while the other columns contain comparative figures relating to the various performances of the individual car.

It should perhaps be pointed out most clearly, that the special types of car selected for these trials were chosen with a view of getting figures from those differing radically from one another in design, and that it is only a coincidence that two or three of them are more or less similar to cars taking part in this year's race. Another important matter to which it is but fair that attention should be drawn, is that the weights carried, and the kind of bodies fitted, varied very greatly, and that our figures must not therefore be in any way taken as a fair comparison of the relative merits of the respective types of car. As will be noticed single-cylinder, twin-cylinder, and four-cylinder engines are represented, some slow-speed, some high-speed, some of the vertical type and some having horizontal cylinders.

TOURIST TROPHY RACE.—Miss Dorothy Levitt on the Mors car which she will drive in the competition. The chassis is the standard 4-cyl., 12-h.p., 4-speed, 1903 type.

In order to enable our readers to apply the results of our tests to the Tourist Trophy Race this year, and to give a good general basis on which any such questions may be considered, we give in Table II an analysis of the contour of the course in the Isle of Man, showing the average gradients and the lengths of the various uphill, level and downhill stretches. From this table it will be seen that each circuit, run in the direction fixed for the event, comprises nearly eighteen miles of climbing, over eleven miles of level, and over twenty-three miles of downhill. Summarised in Table III is an abridged analysis of a similar nature, in which all the average gradients included in Table II that approximate to one another have been grouped, with the distances added together, and the figures thus

"Castle" Accessories in the Isle of Man.—United Motor Industries, Limited, inform us that during the Tourist Trials, Mr. White, motor agent, Prospect Hill, Douglas, will hold a large stock of "Castle" accessories, including the "Castle" accumulators, sparking plugs, induction coils, lamps, "D" lubricating oil, "Castle-Monogram" oil, &c., &c., which will doubtless be convenient to the competitors and visitors.

* * *

A New Road Material.—The long roll of enthusiasts who claim to have manufactured diamonds from cheap materials has received a new accession in an Ashford experimenter (a carpenter by trade), who maintains that he has successfully made diamonds as big as walnuts from ordinary sugar and a benzine blow-lamp. It sounds simple and attractive, and it is therefore satisfactory to learn that the new diamond manufacturer proposes to devote a portion of the enormous wealth which he anticipates

amassing (by the manufacture of diamonds) not only to uplifting the down-trodden, but also to building new and great roads leading out of London, which will mean work for thousands of the unemployed. More power to the Ashford diamond maker! Let us hope that his diamonds will be as big and plentiful as his aspirations, and then perhaps, we may see the roads leading out of London metalled with them instead of granite and flint, a variety of tarmac, in which diamonds replace blast furnace slag, being introduced.

TOURIST TROPHY RACE.—Mr. F. S. Bennett on the Cadillac Car, which is the least powerful of all those entered. It is also the only single-cylinder car competing and it is the only car having a "fool-proof" two-speed gear. No modification to the standard chassis has been made other than the necessary lengthening of the wheel base to comply with the regulations. For this purpose leaf springs have been employed, and an exceptionally smooth running car is the result.

obtained are arranged in order of steepness. The figures contained in Table III are also represented graphically in Fig. 9 by the dotted line, the full line in this figure giving an approximate contour of the course.

(To be continued.)

[Next week we shall publish full details, with comments, of each individual series of tests.]

DURING the Tourist Trophy week, the Michelin Tyre Company, Limited, have arranged to keep a stock of their tyres and accessories at the Athol Hotel, Douglas.

TOURIST TROPHY RACE.—View from above of the Ryknield chassis, showing the three-cylinder engine which has variable left inlet valves. Ball bearings are employed throughout the transmission, but in other respects the chassis is a standard type, with three "speeds" and live axle.

RACES, RECORDS, AND TRIALS.

The officials at the finishing point. Note the Coast-guard'sman (on the top of the bathing machine) who signalled to the starting point.

Mr. Cecil Edge coming down the course at top speed on his 90-h.p. Napier racer.

SKEGNESS SAND RACES.

Skegness Sand Races.—The race meeting arranged by the Notts A. C., was duly brought off at Skegness on Saturday afternoon in fine weather. It could not be said that the track was good, the heavy rain overnight having rendered the sands infirm, and cars which were left standing for a minute were often in difficulties. Drivers consequently preferred to race on the shingle. The course was a mile long, but the actual racing times were not given out. In the tourist events the races were run in heats of three, the winners competing in the subsequent rounds. There was a great crowd on the north parade at 11 o'clock, when the various cars entered for an appearance competition, filed up. There were ten entries and eight exhibits. The gold medal was awarded by Mr. S. C. Coetmore Jones (who judged this event) to Mr. B. W. Winter's 20-30-h.p. Renault, while the silver medal went to Dr. Thompson's 18-h.p. Dennis. The first event on the racing programme was a mile scratch race for motor cycles not exceeding 5-h.p. Four competitors went to the scratch, and the result was as follows:—

1. F. G. Smith, 5-h.p. Clyde (gold medal).
2. H. P. Mays, 3½-h.p. Vinco-Minerva (silver medal).
3. Leslie Pogson, 3½-h.p. Holland.
4. Noel Martin, 3½-h.p. Horn and Co.

The following was the result of the running in the car events:—

One Mile Handicap (limited to cars owned by members of the Notts, Leicestershire, and Derby and District Clubs)—

1. (Gold medal) H. Bircumshaw's 10-h.p. Argyll (rec. 70 secs.).
2. (Silver medal) A. F. Houfton's 16-20-h.p. Humber (rec. 30 secs.).

3. J. Martin's 13-h.p. Lambert (rec. 75 secs.).

Won by ¼ths of a sec. 25 entries.

A special prize (motor clock) was presented to the winner of the above event by Mr. W. T. Berry for the car using Pratt's spirit.

One Mile Scratch Race for cars listed at not more than £200, and to carry a driver only—

1. (Gold medal) Spencer Downing, 10-h.p. Alldays and Onions.
2. (Silver medal) W. E. Wadsley 4-h.p. Orient-Buckboard.
3. Dr. de Beauvais, 9-h.p. Oldsmobile.

Won by 28½ secs. 3 entries.

One Mile Scratch Race.—For cars not listed at more than £350 complete. Cars costing not more than £250 to carry a driver only, and cars costing more than £250 to carry a driver and one passenger:—

1. (Gold medal) J. W. Adams, 8-10-h.p. Humber.
2. (Silver medal) Spencer Downing, 10-h.p. Alldays and Onions.
3. A. R. Atkey, 14-h.p. Minerva.

Won by 16½ secs. 10 entries.

One Mile Scratch Race.—Chassis, price not more than £500, to carry driver and passenger:—

1. (Gold medal) J. Keele, 15-h.p. Darracq.
2. (Silver medal) F. C. Pullinger, 16-20-h.p. Humber.

Won by 5 secs. 12 entries.

One Mile Scratch Race—Chassis price not more than £700, to carry driver and passenger:—

1. (Gold medal) J. C. Wilson, 28-h.p. Daimler.

There were 8 entries, but Mr. Wilson had a walk over.

One Mile Scratch Race (open) for cars of any horse power:—

1. (Silver bowl presented by Mr. Kirkby). F. A. Bolton, 30-h.p. Daimler.
2. (Gold medal). J. C. Wilson, 25-h.p. Daimler. Won by 22 secs. Eleven entries.

To give the public an exhibition of speed afterwards, Mr. Cecil Edge drove over the course on his 90-h.p. Napier, and subsequently he was matched for a mile against Mr. F. A. Bolton's 30-h.p. Daimler (which received 20 secs. start), and Mr. J. C. Wilson's 28-h.p. Daimler (25 secs.). Something, however, went amiss with the Napier, and she failed to start with the others. The same thing happened at the second attempt. Of the other two Mr. Bolton's car won after an exceedingly close finish. Directly afterwards, when it was thought the racing was over, Mr. Edge's racing car came flying along the course at lightning speed. The meeting was held under the patronage of the Earl of Scarborough and Lord Willoughby de Eresby, M.P.; Lieut.-Col. R. L. Birkin, D.S.O., officiated as judge, Mr. E. W. Wells was starter, and Mr. Booth-Granger, an indefatigable hon. secretary. Minor details as to the management were left in the hands of an influential committee.

Henry Edmund's Hill-Climbing Race.—The contest for this challenge trophy, it is announced, is to take place on September 27th, at Blackdown Park, Fernhurst, Sussex, by the permission of Mr. F. S. Philipson-Stowe. Entries close on September 20th, and competing vehicles must be of the recognised tourist type fully equipped, and must carry four persons. The maximum value of the chassis must not exceed £1,000, including tyres. As in other club competitions, times will not be published. The trophy was won for the first time at Castlewellan, Ireland, in July, 1903, by Mr. Campbell Muir.

THE postponed Van Trials, it is stated, will probably be held in the spring, when the arrangements made for the September event will hold good for the later date.

Gordon-Bennett Cup Eliminating Trials.—Once upon a time, in the early part of the year of our Lord one thousand nine hundred and five, there were held certain speed and other trials in the Isle of Man, for the purpose of selecting cars and drivers to represent Great Britain in the Gordon-Bennett Cup Race on the Auvergne Circuit. The times for these tests have recently been discovered, and published in the Automobile Club official journal, and to make our record of the ancient and modern history of automobilism as complete as possible we reproduce these below:—

Car.	2½-Mile Stretch.	Half- Mile.	Mountain Climb.	Net Time of each Circuit.

Scottish A.C. Hill-Climb.—The Hill-Climb announced for Sept. 23rd will take place on Sept. 16th, on Kirkfield Hill, Lanark, instead of the Meet announced for that date at Lochearnhead.

OCTOBER 8th has been selected by the *Paris Journal de l'Automobile* for a speed meeting at Dourdan, over the kilometre and the mile. The programme will include classes for racing cars, tourist cars, and electric vehicles.

THE proposal of the A.C. de France to have a big reliability trial for tourist cars in 1906 is expanding. The latest proposition is, starting from Paris, for the competing cars to travel to Nice, through Italy, to Venice, and from thence to Vienna, Berlin, returning to Paris by way of Holland and Belgium.

Vanderbilt Cup.—It has now been officially decided that the cars will race round to the left, as foreshadowed by us in a recent number of the Journal. In the opinion of many who have carefully examined the new course, of which we gave the official map last week, it is reported to be shorter, has poorer road foundation, is more sinuous, has heavier grades and more turns than the circuit used for last year's race. The approximate distances are: Hyde Park to Jericho, 9½ miles; Jericho to East Norwich, 3½ miles; East Norwich to Greenvale, 5½ miles; Greenvale to Willett's Road, 3 miles; Willett's Road to Lakeville, 4½ miles; Lakeville to Hyde Park, 3 miles. The circuit will have to be covered 9 or 10 times. In regard to the French team, the Richard-Brasier cars have been withdrawn, mainly in consequence, it is stated by Mons. Brasier, of the details of the race not being made public until such a late date, and that the circuit is far too short for racing. In consequence, a second Darracq car, to be driven by Hemery, will take the fifth place as qualified under the rules issued by the French club for the selection of their team.

Electric Vehicle Runs.—Following M. Vedrine's run from Paris to Trouville and back again, recorded by us on August 26th, M. Krieger has provided an even more convincing demonstration of what the ordinary society electric carriage can accomplish, by running two of his vehicles—a coupé and a landaulette—from Paris to Deauville and back again. The running time from St. Germain to Deauville being 4h. 10m. 14s. for the coupé, and 4h. 22m. 30s. for the landau, the former giving an average speed of something over 45 kiloms. to the hour. On the way a speed trial was made on the flat with one of the cars, and 500 metres was covered in 29½s., giving a speed in excess of 61 kiloms. per hour. The return journey was made on the following day from Deauville, and the two cars ran through to Paris in slightly longer running time, without, however, being recharged on the road—the landau taking 4h. 55m. and the coupé 5h. 14m. 16s.

FULLER particulars of the special contest to be arranged by the A.C. de France, in Paris, during the December Automobile Salon, announced by us in our issue of August 26th, have now been issued. The contest is to be held on December 21st, and all competing vehicles must be exhibited at the Salon in a special section devoted to them. The distance in and about Paris will be 100 kiloms., and the vehicles will be divided into two classes, (a) petrol or steam vehicles, (b) electric vehicles. Each class will be sub-divided into four categories, according to their total value, ranging from 5,000 francs to over 12,000 francs. The awards will be made on (a) regularity of running, (b) comfort, (c) the quality and finish of the carriage work. The entrance fee is 400 francs per vehicle, of which 200 francs is reimbursed provided the entered vehicle takes part in the contest, the remaining 200 francs being also returned in the event of the vehicle satisfactorily covering the course and complying with the regulations.

INSPECTOR JARRETT, of Egham, who may claim to rank as a motoring celebrity, has fallen a victim to a nasty accident. While good-naturedly assisting a carter whose "hay-motors" had run away, he received a blow in the face from the shaft of the vehicle, and was rendered temporarily unconscious.

MOTOR BOATING.

BRITISH INTERNATIONAL CUP.—"Brooke I" as she appears after the alterations which have just been made to her hull. Particulars of these modifications in design appeared in our issue of August 26th, the bows have been raised 12 inches, and a new hood has been fitted, which gives the boat a most business-like appearance. In addition, the steering gear has been shifted to the after deck and a permanent glass screen provided in front of the steersman, while the engine now has new valves and a modified carburettor. The petrol tank has been moved right aft and the new propeller has been designed for a normal engine speed of 800 revs. per min.

British International Cup.—As already intimated by us neither the De Dietrich boat nor the Hotchkiss were likely to start next Monday at Arcachon in this race on behalf of France, thereby leaving the burden of defending the Cup on Palaisoto. This last hope of France has now also faded away, as unofficially we learn that this craft will not start either. As announced by us last week the American Club have retired from the contest, advising their decision by cable, thus England will be left with her three representatives, Napier II., Napier and Brooke I. to "walk-over" the course in order to bring back the Cup which, through a technical slip, was last year taken out of the hands of Mr. S. F. Edge. Possibly this "walk-over" may provide just as good sport between the three British craft for the honour of being first past the line over the course as if both France and America had joined in the contest.

British Motor Boat Club.—In consequence of there being a doubt as to whether the 40-ft. racing boats, representing Great Britain at the International Cup races at Arcachon, will be back in time for the racing on 20th and 21st September, the date has been altered to 28th and 29th September. The races postponed from the 10th August will be held on the 30th September, thus making a three days' meeting. A medal will probably be given for the Flying Mile Championship.

NAPIER MAJOR has once again started upon her travels, and has been renewing the display of seaworthiness which has always characterised the performances of this exceptionally reliable ocean-going motor boat. One of her latest journeys provided a test of a most exacting kind, being carried out on a dangerous coast and in weather amounting almost to a storm. On the 17th of August she started from Southampton and encountered such severe wind in

attempting to round the Needles, that she had to put into Totland Bay and await daylight before negotiating the Channel through these dangerous rocks. Starting from Totland Bay at eleven the following day she proceeded on her course, but the sea was so rough in the passage between the Needles where the ebb-tide met the wind that she had once more to put back, and this time ran into Yarmouth for shelter. So severe were the conditions that even two tramp steamers, which can stand most things, also put into Yarmouth for shelter. On the 21st the journey was recommenced, and a very good run made to Portland Bill, and thence to Torquay in the teeth of a constantly increasing wind, arriving at the latter place safe and sound at 4 p.m. on the same day—an excellent performance under the circumstances. Paignton and Teignmouth were visited on the following day, and Napier Major spent the night at anchor off the latter place. At dawn on the following day a run was made back to Southampton with a strong south-westerly gale blowing behind, Southampton being reached at six the same evening. From Southampton the run was continued to Dover with a view of assisting the Channel swimmers, but the weather was so rough that their attempts were postponed. It is satisfactory to learn that in spite of the very trying weather experienced, no trouble whatever was given either by the engine or the hull of Napier Major, which proved, as before, thoroughly seaworthy even in a regular gale.

ALL automobilists take so philanthropic an interest in the activities and performances of the police, that doubtless the tidings that a retired policeman has become a famous manufacturer of violins will excite much sympathetic satisfaction in automobile circles. In fact, one of the ex-policeman's violins has, it is said, been purchased by the young Polish fiddler Von Fiedler—a suggestive combination of names.

THE THORNYCROFT "FLEET" AT THE MOTOR YACHT CLUB'S RELIABILITY TRIALS, 1905.—On the extreme left is the heavy-oil boat, and on the right the gas boat, while between them lie the three smaller petrol boats. All the five craft made meritorious performances in the trials.

MOTOR CYCLING.

Auto-Cycle Club.—The Auto-Cycle Club had a fixture on the card for Saturday last, which is rarely without interest. This is the Members' Consumption Trial, and as the club was again favoured with fine weather a very enjoyable time was spent. The rendezvous was the "Angel Hotel," Thames Ditton, and the trial consisted of a non-stop run to the crest of Hindhead and back, a distance of 57 miles. No pedalling was allowed, and the engine had to be kept running during the whole of the journey. Two cars were in attendance to set a uniform speed, not exceeding 20 miles an hour, and the competitors had to keep between these; if they dropped behind the rear car or got out of observation they were disqualified. Owing to dirt getting on the contact maker, Mr. White had to stop to clean this, and Mr. Smith did not complete the whole distance. The following are the results:—

Entrant.	Machine.	Weight.		Total.	Fuel.
		Ma- chine.	Rider.		
	h.p.	lbs.	lbs.	lbs.	ozs.
H. J. Densham	2½ Excelsior ...	188	158	346	77
E. W. Goslett ...	3 N.S.U. ...	192	140	332	84
W. H. Hayes ...	3½ Rex ...	195	155	350	91
C. G. Thistleton	2½ Bat ...	180	152	332	88
R. S. Fox ...	3 Rover ...	180	150	330	90
A. B. White ...	3 Roc ...	170	152	322	99
S. E. Pemberton	3 Singer ...	175	150	325	122
C. A. Smith ...	Ariel Trike ...	Did not finish.			
F. W. Applebee	3½ Rex Trimo	323 { Driver 136 Passenger 118 }		577	167

Mr. Densham thus wins the silver medal offered for the best performance on a basis of weight and miles per gallon as well as the additional prize for the lowest consumption irrespective of weight. The combined weight of the machine and rider was almost the heaviest, and yet it had the lowest consumption, viz., 118 miles to the gallon.

Mr. Bentley kindly placed his 24-h.p. Clement Bayard car at the disposal of the judges, and Mr. A. B. White brought over a 24-h.p. tonneau car, and these were of the greatest assistance in regulating the speed of the competitors, while Mr. E. M. P. Boileau drove his 10-h.p. Lagonda tri-car to the top of the hill and turned the competitors. Messrs. J. Lyons Sampson and A. G. Reynolds officiated as judges, and Messrs. G. Buryer, H. P. E. Harding, B. A. Hunt, and L. Meyrick Jones rendered valuable aid as observers. The trial was very well organised and carried out, and reflects great credit upon the secretary, Mr. Straight.

Motor Cycle Club.—The contest for the "Albert Brown" Trophy is now announced to take place on October 7th, entries closing on October 3rd. The run will be open to members of the club only, at an entrance fee of 5s., and is therefore a "closed" competition. The rules which govern the trophy provide that the competing motor cycles must be *entirely* of British manufacture. The trial is one of reliability, not speed, and, in addition to the trophy, there are second and third money prizes and a special gold

medal for the best tri-car or passenger vehicle, certificates being given to all drivers qualifying for the final. The trial is a non-stop run of 100 miles, followed, after an interval of one hour for lunch, by a further non-stop run of 50 miles. Each 50 miles must be covered in not less than 2 hrs. 40 mins., a maximum time of three hours being allowed for the distance. No dismounting is allowed during the runs, and only adjustments that can be performed from the saddle while the machine is in motion. During luncheon no adjustments are permitted, but tanks may be filled with petrol and water-cooled engines with water. Additional lubricating oil will not be allowed. The start, which will be within 30 miles of London, takes place at 6.30 a.m., and, in the case of a tie between two or more competitors, special provision is made to decide the winner by extra tests.

Ulster Hill-Climb.—On Monday last the members of the Ulster section of the Irish Motor Cycle Union held the annual hill climb, postponed from the previous Saturday, owing to the inclement weather. Eighteen figured on the card, out of which ten took part in the contest. Ireton, from scratch, did best time, but did not get placed in the event. The conditions were far from favourable, rain coming down before the finish. The contest was held on Gilnahirk Hill, and the times were taken by Messrs. H. J. Shimmions and R. McCann. The results were as follows:—

Name.	Motor Cycle.	Handicap.	Time.
1. A. B. Hamilton	Ormonde	30 sec.	0'53
2. A. Bullock	R. and P.	45 "	0'59½
3. J. Rea	Minerva	25 "	1'2
4. P. Connell	Minerva	20 "	1'5½
5. W. R. Ireton	Riley	scratch	1'7
6. J. Kenneth	Minerva	18 sec.	1'8
7. H. B. Ferguson	Minerva	scratch	1'10½
8. J. Stewart	Triumph	12 sec.	1'12½
9. W. Corry	Minerva	14 "	1'17½
10. H. J. Wilson	Minerva	18 "	1'18½

200 Miles Reliability Run.—On Saturday the annual reliability run, confined to members of the Ulster centre of the Irish Motor Cycle Union, took place. The route was from Belfast to Londonderry and back, the outer journey by the coast and the return by the inland road from Coleraine, through Ballymoney, Ballymena, and Antrim. The prize, the St. Moore Cup, was already put up for competition on two occasions during the present season, but owing to the weather conditions a postponement was compulsory on both. Six competitors started on Saturday, the weather being anything but satisfactory, while the roads were fearfully cut up owing to the rain of the previous week. Before Limerick was reached on the outer journey, Messrs. Parker, Lavery, Whally, and P. S. Brady had retired. Messrs. Stewart and Bullock, riding on, reached Londonderry. After the usual stay the return journey was entered on, and after a gruelling ride Stewart reached the Gown and Shamrock Hotel, Belfast, and was followed soon after by Bullock. The result was a win for Stewart, as under:—

1. J. Stewart, Triumph, 7h. 7m.
2. A. Bullock, R. and P., 7h. 52m.

AERONAUTICS.

It hardly comes within our province to deal with the performance of ordinary undirigible balloons, but considering the long and intimate connection maintained by Mr. Frank Butler with the Automobile Club, a special interest will be felt by all its members, and by automobilists generally, in the adventurous manner in which Mr. Butler, in his balloon *Vera*, accompanied by Mr. Percival Spencer, decided on seeing the eclipse, which on last Wednesday proved unfortunately invisible to the greater majority of Londoners. In a high wind, estimated at about 33 miles an hour, the adventurers started from the Putney Gas Works, and rising above the clouds obtained a number of good views of the eclipse, of which they took photographs. Afterwards they passed through several snowstorms, crossed the Channel where its width is very considerable, and ultimately landed at Caen, in Normandy.

Mr. Butler's short but pithy description of his adventures is as follows:—

"London was in a fog of clouds, and rising up from Wandsworth and Putney Gasworks at 12.45 in 2½ minutes we were in the sun. Immediately we began snap-shooting at the sun, and took some splendid photographs of the eclipse, and owing to the sun being so brilliant three pairs of fumed glasses had to be used. In an hour and a half a siren was heard, and we knew we were near the sea, as we had not seen land from London. Here we saw the piers at Brighton and the breakers dashing and roaring against the beach.

"For five hours and thirty-five minutes from the shores of Albion we were at the mercy of the wind above the sea. Below were a few steamers and sailing-vessels going down the Channel. Rising to 10,200 feet deep silence prevailed, and snow began to fall. We had calculated to make France in three and a half hours at the rate of speed we had been travelling from London to Brighton, which was 33½ miles an hour. Descending again we saw nothing but a rough sea with white foam tops, but our compass shewed that we were still going south. We tied up our cameras in the hoop to prevent the films getting wet, in case we had no ballast and came down into the sea.

"At last we saw a harbinger of land, which was a seagull, and soon after some fishing boats, so we thought we could not be far from the French coast. Nine fishing boats appeared, and a black line with white waves marked the coast. At 7.45 a lighthouse and

the lights of a town began to appear, which Mr. Butler thought was Trouville. We soon arrived over the town, and heard the shouts of people in the Casino. We landed at 8 p.m. in some fields at La Délivrande (a suggestive name to land at), near Caen, in Normandy, after being dragged a mile across the fields before the grapnel would hold. Leaving the balloon to empty itself, we walked to the light of the village and found comfortable sleeping accommodation at the hotel 'Notre Dame.' Sending the balloon from Caen by steamer to Newhaven, we returned to London *via* Trouville and Havre, after making the record voyage of 200 miles in the widest part of the channel. The air recognises no frontier, Custom-house, octroi, or police for furious driving."

Mr. BALDWIN, the aeronaut whose navigable balloon gave such an excellent account of itself at the St. Louis Exhibition last year, has tragically become a victim to his own enterprise. In the presence of a large crowd of people at Greenville, Ohio, Baldwin went up in his balloon to demonstrate that dynamite could be successfully exploded (for military purposes) from a balloon. He demonstrated it to perfection, but the detonation occurring before it was intended, blew him and his balloon into tiny pieces, a frightful explosion being observed at a moment when it was assumed the aeronaut was liberating the dynamite to drop upon the ground below. The balloon was suddenly blotted out by a huge cloud of smoke, and this was followed by a rain upon some of the spectators of pieces of balloon and fragments of the adventurous aeronaut all mixed up together. It is believed that the explosion occurred when Baldwin was adjusting a fuse to one of the sticks of dynamite with which he was proceeding to experiment.

"HAY MOTOR CO., LTD." is the title of a new company which has just been registered. This is not, as might be supposed, a forlorn hope to rehabilitate the horse in popular favour by way of company exploitation of him, but refers by the irony of circumstances to a company for manufacturing motor cars, cycles, and other vehicles, of which Mr. W. G. Hay is the leading spirit.

CLUBS AND ASSOCIATIONS.

We referred last week to the splendid example set by the Leicestershire Automobile Club in giving the cripple children of Leicester an outing on motor cars. We are now enabled by the courtesy of Mr. A. M. McAlpin, the Hon. Secretary, to reproduce the above interesting photograph showing by the happy expression on the faces of the afflicted ones the appreciation which the kindly action created. Amongst those who lent cars for the occasion were:—Messrs. E. G. Mawbey (president), J. A. Corah (vice-president), H. A. Hamshaw, Capt. Byron, H. H. Wildt, E. H. Faulkner, G. H. Wait, C. Bennion, T. C. and S. W. Clarke, J. A. Bennett, W. G. W. Reynolds, Dr. Pemberton Peake, H. E. Barron, J. E. Johnson, J. A. Doran.

The Automobile and Cycle Engineers' Institute.—The opening meeting of the session 1905-6 will be held in Birmingham on Thursday, the 26th October. At this meeting the president for the year (Mr. A. E. Tucker, F.I.C.), will deliver his presidential address, which will probably take the form of a paper.

A.C. of West Australia.—On July 1st this now healthy club held their first opening meet at Perth, W.A. The cars started from Government House Grounds, when the official send-off was given by His Excellency Admiral Sir Frederick Denham Bedford, G.C.B., the members joining in a procession headed by the President Mr. A. E. Morgan's car, along Mounts Bay Road to the residence of the Vice-President, Mr. K. Strelitz, at Cottesloe. Upon the conclusion of the return journey the members were entertained by the President. Amongst cars which took part in the run were Daimlers, De Dions, Oldsmobiles, Rovers, &c. The one regret of the indefatigable secretary, Mr. Alfred W. B. Mather, appears to be that so far they have not seen a Napier car in the Colony. The West Australian Club is already making considerable progress and is helping to spread the cause materially in the Colony. Already there is a fine motor omnibus service in Perth successfully competing against the electric trams, which in so young a State is a big feather in the cap of the motor industry. In order to help matters along, the Committee of the club are prepared to allow makers' catalogues, designs, and drawings to lie upon the reading-room table for the use of members and their friends, and we hope that all the trade throughout Great Britain will speedily take the fullest advantage of this offer by sending out a batch of their latest literature.

Blackheath A.C.—The members of the club were "at home" on Saturday last in the grounds of the 2nd Volunteer Battalion, the Queen's Own (Royal West Kent Regiment) upon Blackheath, lent for the occasion by Col. E. J. Heward, V.D. The parade ground proved an ideal site for the very successful gymkhana which was the attraction of the day, 28 to 30 cars taking part; about 150 members and guests were present, including Col. H. C. L. Holden, R.A., F.R.S., who acted as judge, Messrs. Granville M. Kenyon (Secretary of Kent Automobile Club), R. S. Jackson, F. W. Warrington, Dr. Hooper, Dr. C. Firth, &c. Mr. Leonard Beadle, the captain of the club, acted as clerk of the course, and was assisted by Messrs. A. Jackson, H. A. Cunis, H. A. Boak, Stanley Norfolk and other members of the club.

In the gymkhana which took place the following events were carried out and created much amusement, and at times excitement to the onlookers.

Crawling Race.—1. Leonard Beadle; 2. E. H. Fraser.

Reversing Race.—1. Fred Thorne; 2. E. H. Fraser.

Starting and Stopping Race.—1. L. O. Eagleton; 2. Dr. C. Firth.

Motor House Race.—1. R. Kingsnorth; 2. Fred Thorne.

Speed Judging Competition.—The constables on duty at the gates and others in the vicinity were invited to join in this competition. 1. Fred Thorne; 2. A police constable.

The band of the regiment played a good selection of music under the conductorship of Bandmaster C. S. Birkhead, and afternoon tea was served in the drill hall adjoining the parade ground.

IN regard to the five Daimler cars which took part in the Herkomer Trophy event, and the report that they all suffered from tyre trouble, the Continental Tyre and Rubber Company write us as follows:—"We should like to point out that Mr. Philip Dawson, whose 35-h.p. Daimler car was the only one fitted with Continental tyres, informs us that he made the run from London to Bavaria and back, and also took part in all the trophy competitions without the very slightest trouble with tyres, and without having had a single delay due to punctures."

LAST week we gave an account of the marvellous adventures of a certain motor cyclist of the name of Frederick Payne in the neighbourhood of Maidstone, who according to his own account was set upon by a gang of hooligans, and only escaped with his life and motor bicycle by firing over their heads with a revolver, and ultimately right through the hand of one of them. The alleged hooligans are, it appears, harmless mariners of the most exemplary character. That, at any rate, is what they say themselves, according to the *Kent Messenger*. On the occasion referred to they were, they stated, walking along the road two and two, one of them with a young lady heading the procession, when the apparition of a motor bicycle suddenly hove in sight, and without word or warning commenced to discharge a revolver as if it were a Maxim gun. Such, therefore, being the very conflicting character of the occurrence, as given from opposite points of view, we await the result. The police court proceedings which have resulted with a considerable amount of interest.

An Adaptable Commutator.—A very simple form of commutator, which can be made suitable for fitting to any make of engine, has recently been brought out by Messrs. Conningham. The device, shown complete and dismantled in our illustration, consists of a brass casting, A, fitted with an ebonite insulating ring, A², which carries the "live" terminal, C, and the commutator, B,

Everybody was thoroughly delighted, particularly the outside passengers, who enjoyed a view not only of the Surrey and Sussex scenery but also of the eclipse, which was denied to most Londoners. Of course the pace was not tremendous, and a representative of one daily paper who, perhaps, had relied on a speed of 30 miles an hour to cool the fevered contents of his

skull, was quite annoyed at the steady progress made, and indulged, in a subsequent account, in a very tolerable effort at sarcasm at the 'bus's expense. At the same time, we think the promoters of the enterprise showed moderation and good sense in not attempting a high rate of speed. It is all very well for ordinary motor cars with a few passengers on board to run up to the legal limit, but 7 tons of 'bus and passengers hurtling along at that speed on an ordinary road would not be a pastime to encourage too much. Everybody but the gentleman to whom we have referred seemed to thoroughly enjoy the tour. The weather was, perhaps, not ideal for the Brighton Road, but the

A ¹ Timing lever fixed to A.	mutator.	C Terminal on A.
A ² Ebonite insulating ring.	B ¹ Brass segment on B.	C ¹ Spring contact in C.
A ³ Screws holding A ² to A.	B ² Brass bush on B.	D Oil hole.

which forms the revolving portion. The adaptable part of the apparatus consists of the brass casting, A, which can be made to any size. The ebonite ring, A², which is standard for all sizes, is fastened in place by three equidistant screws, A³, so that the casting, A, may be shifted round to bring the timing-lever, A¹, into any desired position relatively to the terminal, C. The terminal, C, is mounted on the ebonite ring, A², and is fitted with a spring-contact, C¹, which presses on to the revolving commutator, B. The commutator, B, is of ebonite, and is mounted on a brass bush, B², which forms one piece with the disc, B³, on the back of the commutator. In electrical connection with the disc, B³, is the commutator segment, B¹, which makes contact, once every revolution, with the spring terminal, C¹. An efficient "earth" is ensured by the contact between the disc, B³, on the back of the commutator and the casting, A, as well as by the usual connection between the brass bush, B², and the shaft on which it is mounted. The commutator is intended to run in oil, and the oil hole for this purpose is plugged with a screw, D. A brass cover plate is attached to the front of the ebonite ring, A², and is held in place by the same screws, A³, which fasten the ebonite ring, A², to the casting, A.

trip certainly provided an occasion for demonstrating to the insensate votaries of mere speed, what the pleasures really are of travelling along a country road at moderate pace, a pace which is, after all, in excess of the stage coaches which used to provide such a popular means of travelling from London to Brighton. None of the travellers should run away with the idea that the 'buses could not have gone faster, but the Local Government Board, in its wisdom or caution, has limited the speed of "heavy motor cars" to twelve miles an hour. In fact, that twelve miles is itself a concession which is only enjoyed by rubber-tyred vehicles. At the same time, though the limit is reasonable enough for motor 'buses in crowded towns, some relaxation might be permitted on open country roads.

London to Brighton by Motor 'Bus—The motor 'bus trip, organised by the London Motor Omnibus Company, to Brighton and back, on Wednesday last, by way of inaugurating a week's trial prior to establishing a regular service, was a decided success. Three good tons of passengers were transported from London to the sea, the 54 miles from the starting-point—the Metropole Hotel—to the finish at Brighton being covered in a little over four hours of running time. The return journey was only marred by the way being lost, thereby causing some delay.

LONDON TO BRIGHTON BY MOTOR OMNIBUS.—The start of the "Vanguard" Motor Omnibus from the Hotel Metropole for its inaugural run to Brighton and back on Wednesday, August 30th.

An example of a 15-h.p. Ryknield landaulette which has just been specially completed for Mrs. Lewis Waller for use during her summer tour with "The Admiral's Lady." The car is fitted with a Ryknield standard three-cylinder 15-b.h.p. engine and is British built throughout.

Overhanging Trees.—We have rarely heard anything more absurd than the accounts of certain legal proceedings which have just taken place in the Isle of Wight. Near Seaview, in the neighbourhood of Ryde (the place where recently motor boat events were held) there is a tree hanging over the public highway, and projecting from the property of Mr. W. A. Glynn, J.P. This magistrate has been summoned to show cause why he should not remove a large branch of his tree, and according to the reports published he has been "showing cause" by maintaining that the motor 'buses which run along the road are not carriages entitled to the protection of the Highways Act. This contention is ludicrous enough as the Motor Car Act of 1896 particularly states that a light locomotive is a carriage for the purposes of any previous Act of Parliament. Possibly Mr. Glynn thought that this only meant that a motor car is a carriage in this sense for the purposes of facilitating punishment. According to the Highways Act of 1835 :—

"If the surveyor shall think that any carriage-way or cart-way is prejudiced by the shade of any hedges or by any trees . . . it shall be lawful for any one justice of the peace on the application of a said surveyor to summon the owner of the land . . . to show cause why . . . such trees are not pruned or lopped in such manner that the carriage-way or cart-way shall not be prejudiced by the shade thereof . . . or why the obstruction should not be removed."

The surveyor of the old Act is now in general the District Council, but from the above quotation it is quite clear that whether a motor 'bus is or is not a "carriage" has nothing at all to do with the question. We are not surprised, therefore, that the case went against Mr. Glynn, though "a case" is to be stated.

"WITH Webb Jay horribly smashed, and even now not out of danger; with Earl Kiser in a hospital minus a leg; with Barney Oldfield swathed in bandages after miraculously escaping death, humanity calls for the immediate suppression of automobile track racing."

The foregoing paragraph in an American automobile contemporary sums up the feeling in the United States which appears *at last* to have taken hold strongly of the majority of those concerned, in regard to the unsuitability of tracks for automobile racing, a conclusion which was reached several years ago in this country. The agitation to stop this foolhardy track racing has been brought to a head by the shocking accident at Buffalo, of which we exclusively gave particulars in our issue of August 26th, to Webb Jay, one of America's most popular motor drivers, who has so long been associated with the White Steam Car Company. Webb Jay's machine, after crashing through the fence, rolled down the embankment into a sheet of muddy water, the crash through the fence having rendered Jay unconscious. He was himself found with his head imbedded in mud and water. The injuries which he sustained were a broken right arm, a compound fracture of the left leg, even

broken ribs, and concussion of the brain. In addition one of his lungs was lacerated by his splintered ribs, and he was otherwise internally hurt. It was hardly surprising, therefore, that at the time the news was cabled his life was despaired of, but in spite of all this complication there now appear to be hopes of Jay's ultimate recovery.

THERE has just been launched at Guernsey, locally built by F. Crespin, boat-builder, after designs by the owner, Mr. Louis R. Cohen, a 25 ft. semi-torpedo-launch. The engine is a 15-h.p. twin-cylinder petrol motor, from the workshops of the Truscott Boat Manufacturing Company, of St. Joseph, U.S.A.

TOURIST TROPHY RACE.—A disastrous trial run in Wiltshire resulted in the wrecking of the original Scout Car entered by Messrs. Dean and Burden. Another chassis is being built, and this may yet be ready for the Race. This is almost the only new make of car entered for the event. It has a live axle, four cylinders, and three speeds.

THIS week we draw attention editorially to the improved spirit which appears to be animating magistrates in various parts of the country in dealing with the automobilists arraigned before them. The Andover Bench, however, still maintains its notorious reputation. Last week we drew attention to the preposterous utterances of the chairman, Colonel Harman, as regards speeds for motor cars on a main straight open country road. This week Mr. Stephen Coleridge was one of the victims brought before this tribunal. In spite of the most lucid and convincing evidence tendered both by Mr. Coleridge and his chauffeur, and the fact that Mr. Coleridge himself was in possession of testimonials from two of His Majesty's judges bearing witness to his great carefulness as a driver, the Andover Bench fined him £5 and costs. We are glad to learn that notice of appeal was given. As we have pointed out, the proper method of dealing with an exceptionally reactionary bench of magistrates of this kind is for as large a number as possible of automobilists, unfairly convicted by them, to appeal if they can afford it. It is flagrant cases of this kind which more than justify our suggestion that under any revision of the Motor Act provision should be made for the recovery of costs to follow automatically in successful cases of appeal.

WE have often pointed out to what an extent some of the evening papers, which appeal, or attempt to appeal, to the masses, do their best to inflame irritation against the automobile movement by mis-stating and exaggerating wherever possible (or whenever they think of it) all cases of accident in which a motor vehicle is even remotely connected. On the 25th of May last, a case was recorded in the *Star* in the following words:—

"Joseph Bates, when cycling at Hendon, collided with a motor, and was killed instantaneously."

A coroner's inquest was held on the death of Bates on the 29th of the same month, and this is the verdict at which they arrived:

A 10-h.p. Clement delivery van, which in the recent French Delivery Van Trials was successful in winning five medals. But for the postponement of the Van Trials in this country, this would have been one of the types of vehicle which would have represented Mr. E. H. Lancaster in the competition; he controls this particular type of vehicle in England.

A NEW MODEL DURYEY CAR.—This identical carriage has just been delivered to Mr. Garrett Campbell, of Belfast, and is of 15-h.p. The wheel base has been reduced from the regular standard size to 7 ft. 6 in., in order to give greater latitude in narrow roads and turning. The extension hood with which the car is fitted folds back to form a dust screen in dry weather. The hole seen in the side of the battery box on the foot-board is where the starting handle is inserted. The car is fitted with Collier tyres and weighs just over 17 cwt.

"Joseph Bates died from shock and concussion of the brain and other injuries, which the deceased sustained when he fell from his bicycle in Colin Deep Lane, he having lost control of his machine, and from accidental causes."

As a matter of fact the motorist and his car arrived after the accident, and rendered valuable assistance. Comment is needless.

APROPOS of a motor car accident to the Marchioness of Headfort, which she sustained when motoring to Headfort Castle, near Kells, in Ireland, from which the Marchioness fortunately escaped (almost miraculously without injury), the same paper has the taste to head its account of the incident "Maisie's Motor Smash," but, alas, for the veracity of our enterprising contemporary, the Marchioness was not in the car at all!

A MOTORIST should be an awkward person to attack, as if he has pluck and presence of mind he generally has a handy weapon about on his car. Such was the case of Mr. Carter, a young American, who was recently attacked by two Paris hooligans—*Apaches*, we believe, is what they call themselves in Lutetia—who went at him with knives, desiring to obtain possession of his lunch basket, valise, or something of that kind, which was attached to the car. He was repairing the tyre at the time, and he felled one of the hooligans with the iron cover remover which he held in his hand, whereupon the other one took to flight, and two policemen appeared on the scene.

WHAT might have been a serious fire on Wednesday last, on the premises of Fiat Motors, Limited, 37, Long Acre, was speedily checked by the use of the New Era Extinguisher, which promptly subdued the petrol flames. As it was, only three cars were destroyed of the £30,000 worth of stock, and the promptness of the arrival of ten fire engines saved the premises from serious damage. Business has, therefore, in no way been interfered with.

THE Car and General Insurance Corporation, Limited, under the able management of Mr. Frederick Thoresby, advise us that they have just opened a new department for the insurance of live stock, plate-glass, &c. Mr. G. W. Hinde, the late assistant secretary of the National Live Stock Insurance Corporation, will have the management of this department, thereby ensuring that the Corporation will not be venturing into a new field without providing the necessary experience for its successful carrying on.

THE Heaton Moor Motor and Cycle Works, of Stockport, advise us that they have removed their garage from Birch Avenue to larger premises at Portland Grove, Heaton Moor Road. At the new address they have accommodation for about thirty cars, and have a range of machine tools, dynamo for recharging, vulcaniser for tyre repairs, and a specially constructed inspection pit, which is provided with an airshaft with a revolving cowl to draw off all petrol vapour. Accessories of all descriptions and petrol are stocked, and to provide against the chance of fire the whole floor of the works and garage has been concreted.

Fiat Motors, Limited.—The directors of Fiat Motors, Limited, have declared a dividend of 5 per cent. per annum on the preference shares, and an interim dividend of 5 per cent. on the ordinary shares, for the six months ending June 30th.

WE are informed that the A.C.G.B.I. have expressed a wish that the 10-guinea cup offered by the Continental Tyre Company for the fastest circuit on Continental tyres in the Tourist Trophy contest should be withdrawn, as it would tend to interfere with the rules of the competition.

MR. THOS. VICKERY has, under the name of the Ealing Park Motor and Cycle Engineering Company, started a repair depot at 11, Twynham Terrace, Ealing Road, W. The works are situated between Ealing and Brentford, connecting the Oxford and Bath roads. They include a range of the necessary machinery for effecting all kinds of repairs, a complete vulcanising plant, facilities for charging accumulators, &c. Petrol, oil, grease, and all the usual requisites are stocked. Mr. Vickery is also prepared to keep cars in order for a fixed sum per annum.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

27361. 15th December, 1904. Improvements in and relating to Carburettors for Internal Combustion Engines. Frederic de Mare, 122, Boulevard Leopold II, Brussels. The principle of this carburettor consists in causing a current of air to pass through a thin sheet of carburetted liquid. This thin sheet is obtained by a kind of endless belt of metallic gauze plunging into the liquid and revolving with a continuous or intermittent movement in front of the air-feed pipe. There are twenty figures. Fig. 5 is a section of the carburettor. On each of the spindles, 9 and 10, there is respectively keyed a metal drum, 11, 12, provided with toothed cheeks, 13, 13, intended to carry along the metallic belt, 14, having more or less fine meshes, and the edges of which are perforated to enable them to engage with

27. It may be necessary to modify the original mixture and to add a fresh quantity of air thereto; this is the duty of the movable cone, 28, which is tightened up or loosened according to whether it is desired to restrict or increase the air-feed. By operating the diaphragm, 21, and the cone, 28, it will be seen that it is easy to obtain mixtures varying greatly in their composition.—August 17th, 1905.

17543. 18th August, 1901. An Improved Coil Friction Clutch. William H. Lindsay, Benview, Overton Road, Johnstone, N.B., and Haden K. Couper, Kirkfield, Johnstone, N.B. This invention consists in a coil friction clutch in which the coil friction is created by the expansion or opening out of a split or divided wheel which is surrounded by the coil. The clutch is specially designed for use in driving at high speeds as in automobiles. There are six figures. Fig. 1 is an elevation of the clutch. Fig. 3 is a transverse section on the line, x x, of Fig. 1. Keyed on the driving shaft, *a*, is a driving

coil, *c*, and driving plate, *b*. To put the clutch into action the sliding collar, *i*, is moved along the driven shaft, *e*, into contact with the set pin, *h*. Under the pressure exerted on the set pin, *h*, by the collar, *i*, the lever, *g*, turns about its pivot, *f*, and the wheel, *d*, is opened out or expanded at *d'*, and binds against the inner face of the coil, *c*. The driving shaft, *a*, is thus made to rotate with the driven shaft, *e*. The binding action of the coil, *c*, is first set up by the outer turns of the coil, that is to say, by the turns on which the heads, *c'*, are formed. The remaining turns of the coil are tightened after the outer turns, and thus the binding action between the wheel, *d*, and the coil is set up gradually.—August 17th, 1905.

the teeth on the cheek, 13. The movement is communicated to the belt by one of the moving parts of the motor connected to the toothed wheel. The carburetted liquid is fed through the pipe, 16, connected to 17 by a nut, 18. The carburettor can be emptied by the outlet, 19. By its movement the belt plunges into the liquid, and by surface tension (capillarity) carries along in its meshes a fine sheet of liquid which passes before the bent pipe, 20, the inlet orifices of which may be closed more or less by a diaphragm, 21, actuated by a lever provided with an index finger showing the size of the aperture. In front of this diaphragm there is a piece of wire gauze, 24, for filtering the air sucked in. In its passage through the moving band of gauze the air has mechanically carried along the liquid contained in its meshes, and has become thoroughly mixed therewith. On leaving the gauze the mixture is conducted by the cone, 25, into the conical chamber, 26, and thence to the cylinder by means of the tube,

One of the picturesque spots opened up by the London and North-Western Railway Company by means of their motor omnibus services. The view given in our photograph is in Northorp Village, one of the points passed through during the service between Connah's Quay and Mold, which connects up the main line to Holyhead with the cross-country line from Mold to Denbigh. The cars start from Connah's Quay, and run alongside the estuary of the Dee as far as Flint. From thence the road leads south over Flint Mountain, from which a very extensive view of the whole estuary of the Dee is obtained, and then on through the picturesque village of Northop to Mold, a distance of 10½ miles. Northop has hitherto been much isolated, the nearest railway station being 3 miles away. The same route is taken on the return journey.

PASSING EVENTS.

The Pre-eminence of the British Motor Boat.

SOME reflections are suggested by the fact that in the race for the International Cup, which was held in Arcachon Bay on Monday, of the four starters three proved to be English motor boats, while only two, the Napier boats, successfully ran over the course. At the last minute, when it appeared that there would be none but English competitors, the French succeeded in putting M. Thubron's Mab forward to sustain the fight on the part of France, so that the event should not be merely a "walk over" for the English boats. Everybody must admit that this was a sportsmanlike thing to do. But the small number of entries, and the total absence of interest in the competition displayed by so "motoriously" progressive a country as France, seems to show that belief in the value of the racing motor boat is on the wane. We do not believe that this is altogether due to the fact that the British industry has, as in the present, proved itself so generally superior. Rather are we

inclined to conclude that our neighbours recognise that more pecuniary return is to be obtained from developing the commercial motor boat.

And this may perhaps be the reason why they have made no great efforts to enter the lists in the mere racing boat contests, for, after all, almost a bigger gap separates the racing motor boat from the commercial harbour barge than exists between the racing motor vehicle and its commercial counterpart. There is an enormous future before the motor harbour boat, or barge, as is very clearly shown by the investigations carried out by Sir Christopher Furness and the Members of Parliament whom he has personally conducted to a number of foreign ports where motor boats are successfully employed for the trans-shipment of cargoes. In Dutch and Belgian ports alone there are some 3,000 to 4,000 of these boats in use for this purpose, while a huge number are also employed at Hamburg, Bremen and other foreign ports. The motor barge has as yet hardly found its way into the port of London, and it is not surprising, therefore, that Sir Christopher Furness described the English method of dealing with cargoes as suitable to the days of Queen Elizabeth, but wholly antiquated now. In spite, therefore, of the seductions of international races, in which English motor boats have shown up so triumphantly, we would recommend, for the benefit of the country and the motor boat industry, that motor boat builders should devote a certain proportion of their energies to the equipment of suitable harbour motor barges. When it is generally known that harbour motor boats can be obtained, the appearance of the motor barge in our principal ports, with all the attendant benefits that will result, both for its manufacturers and for those who use it, will not be long delayed.

♦ ♦ ♦ "The Coming of the Motor 'Bus.'"

THIS heading forms the title of a leaderette in the *Pall Mall Gazette*, based on statistics provided by the *Daily Telegraph*, and designed to show that our seaside resorts at any rate have proved the efficiency of the motor 'bus as a competitor with the tramway. Many of our seaside towns have shown themselves particularly enterprising in the adoption of the motor 'bus, and it is satisfactory to learn that the 'bus services in most of them are doing well, while the service running in Torquay has special claims on the attention of promoters of motor 'bus undertakings, as in this case the annual report shows that after putting aside an adequate sum for the renewal of tyres, the company, which is running in competition with a local tramway company, is still able to pay $7\frac{1}{2}$ per cent. dividend on the capital involved in running its eight 'buses. With results such as these obtainable in seaside places where the traffic is a fluctuating one, and where for, at any rate, months in the year the return is problematical, the prospects of the motor 'bus in the Metropolis should appear decidedly rosy, as in fact they are proving themselves to be.

♦ ♦ ♦ Motor Car Accidents—Facts v. Fiction.

THE police of the Metropolis have furnished returns of the number of fatal accidents due to different varieties of conveyances existing in the Metropolis for the last eight years, ending 1903, and the data furnished are certainly instructive as regards the relative danger to the public of motor cars and horse-drawn vehicles. We take the year 1903, the latest of those for which a return is

furnished—a return for 1904 being beyond the capabilities of officialdom up to the present—as a fair sample, that being the year of the report in which motor cars came into most general use. In this year, fatal accidents due to motor cars in the Metropolis amounted to 4, those due to traction engines being only 1. Accidents produced by horse-drawn vehicles provide the serious total of 130, while tramcars are responsible for no less than 8, exactly double the number of fatal accidents due to the automobile. Comment on these figures would merely detract from their eloquence, and they certainly ought to have a reassuring effect on the mind of the public of the Metropolis and most other places.

♦ ♦ ♦ A Drastic Countermove.

As a practical protest against a recent decision of the Buxton magistrates, the committee of the Nottinghamshire A.C. have determined upon a course of action which may have consequences of a far-reaching character. At the petty sessional court on Saturday, in the face of a decided conflict of testimony, the justices imposed a fine of £5 and costs upon the chauffeur employed by Mr. John Hall, J.P., of Manor House, Ashby-de-la-Zouch, for driving a motor car to the danger of the public. Defendant swore he did not exceed eight miles, and Mr. Hall's belief was that they did not exceed seven. He offered to give the car to anyone who could drive it at eighteen miles an hour up the thoroughfare in which it was seen by the police witnesses. Notice of appeal was given—the licence not to be endorsed pending the result. Meanwhile the Notts Club has marked its sense of the matter in no unmistakable way. Under the auspices of the organisation of which Mr. Booth Granger is honorary secretary, it had been arranged to hold an inter-club meet on Saturday next at the Palace Hotel, Buxton, the latest addition to this health resort's many large establishments. The Leicestershire, Derby, Manchester, Lincolnshire, Sheffield, and Yorkshire Clubs had accepted invitations to join, and experience of a previous meeting warranted the anticipation that there would be an assembly of at least 150 cars, with probably an attendance of between 200 and 300 at the dinner, which it had been arranged to hold in the evening at the hotel. Now the decision has been arrived at to abandon the whole programme as far as Buxton is concerned, to mark the sense of the indignation felt in relation to the case referred to. The step taken by the Notts Club is calculated to serve as a useful object lesson of the possible loss which may be entailed upon a town by ill-considered decisions. Ashby-de-la-Zouch is to derive the benefits which should have been Buxton's, the venue of the inter-club meet on Saturday having now been changed to the former town.

♦ ♦ ♦ Main Road Traffic and Side Roads.

THERE is always a certain amount of danger involved where traffic debouches on main roads from by-roads, particularly when the latter meet the main road at a right angle. With a view to minimising these dangers, the following resolution has been adopted by the Irish Automobile Club, with Sir Horace Plunkett in the Chair:—

"This committee desire to emphasise in the very strongest manner, for the information of members, the fact that the driver of a car on the main road has a right of way prior to any car approaching on a by-road; that all main-road traffic has a prior right to

by-road traffic, and that the greatest necessity exists for members, when driving in a by-road and approaching a main road, to slow down, and use the utmost caution, and to give way, as far as possible, to the traffic on the main road."

We conclude that this resolution is to be understood in the light of a counsel, more or less of perfection, for unfortunately there is nothing in the Highway or other laws which can be legally interpreted to mean that main road traffic has any prior rights as compared with traffic running on by-roads. At the same time, it is to be hoped that all automobilists and all other users of the road will make a rule of, as far as possible, acting according to the spirit of this resolution. In fact the Automobile Club and the Considerate Drivers' League have been most industrious in impressing upon all drivers the necessity of caution at cross roads.

"(H)andover" Justice (?)—The proceedings of the Andover Bench and the monstrous prejudice that they evince in all automobile cases has elicited a strongly worded protest from a borough magistrate, who writes as follows:—

"As a magistrate, allow me to raise my protest against the most unjust method of prostituting the law in some courts with regard to motorists. When gentlemen are elevated to the Bench, they are expected to act with a spirit of fairness and impartiality towards all those who are brought before them, and not to treat anyone as a criminal until the evidence is such that there is no element of doubt in the case. After the strong expressions which have been reported from various magistrates anent motors and motorists, it appears that these people are not entitled to receive justice, and are far greater criminals than thieves, for these latter are allowed to defend themselves. In the case of motorists, neither the one summoned nor even counsel for his defence are given any fair hearing. It would be well if the Lord Chancellor would direct his attention to the case of these unjust dealers-out of the law, and bring them to realise that their methods require altering. In criminal cases, where the offence is proved to be the first, the prisoner is dealt with in such a manner that he feels that the Court is wishful to give him a chance of doing better. Not so in the case of motorists; they are all dealt with as hardened criminals, and nearly the maximum fine inflicted for a first offence. On the subject of fines, one wonders whether in those courts where this heavy system of fines has been adopted there has been a shortage of money from other criminal offences, and this deficiency has to be made good to fill their coffers by this legalised system of robbery, for it can be called by no other name."

THE police had quite a bad time of it at Mr. Hopkins's court one day last week. There were three several summonses against three several motorists, and all of them were dismissed, the defendant in one case only being called upon to pay the costs. They were all more or less frivolous cases. Mr. W. A. Barrington, of Walworth, was summoned for riding a motor cycle after dark without having the rear plate properly illuminated. He proved, however, that he had a light shining on it, and the magistrate said he saw a great many of these machines, but never saw one in which the plate was not properly lighted up. Mr. R. Coleby was summoned for not having informed the London County Council of a change of address. Mr. Hopkins remarked that he would not like to say that every motor car owner was obliged to send his change of address to the Council. If the police wanted to contend for that proposition they would have to do so, and he accordingly adjourned the summons *sine die*. In the other case, Mr. Charles Nicholls, of Worthing, was brought up at Lambeth Police Court, on the charge that he "did unlawfully allow the registration plate to become so obscured as not to be distinguishable." The charge was that the driver was wearing a macintosh, which reached down behind and obscured the plate. The defendant said he

was convinced that his coat did not cover the plate. Mr. Hopkins said the summons was a mere waste of time, *but* he told the defendant to pay the costs, amounting to 4s.

ANOTHER of the park cases was brought up recently before Mr. Marsham at Bow Street, in which Mr. Leopold de Rothschild was summoned for exceeding the 10-mile limit in one of the parks. The case was adjourned for the production of Mr. Rothschild's licence—in our opinion a wholly illegal proceeding. There is absolutely no reason why a motorist should produce his licence in a police court before conviction. The magistrate should decide the case on its merits, and only after conviction can he call upon the motorist to produce his licence for the purpose of endorsement. Even then he is not bound to produce it instantaneously, but merely *within a reasonable time*. Of course, the object of the police is to ascertain before conviction whether there have been any previous convictions endorsed on the licence. But that is wholly opposed to the principles of British jurisprudence, and it is a principle of common law that a man's previous convictions must not be adduced against him till his guilt is established, and then *only* for the purpose of deciding the measure of his punishment. Motorists ought to make a determined stand on this point, as it is altogether illegal. In this case, Mr. Marsham insisted upon endorsing the defendant's licence, in which, we fear, he was legally quite correct, though a number of magistrates have taken a more lenient view, and have refused to endorse mere offences against the "parks speed limit."

IN a case recently brought before magistrates at Morpeth, an automobilist was convicted for refusing to produce his licence to a police constable not in uniform. It was alleged in his defence that the law only intended that a motorist should be compelled to produce his licence to a police officer in uniform, and that as the police officer in this case was not in uniform no offence was committed. As a matter of fact this is a proper decision. If ordered to produce his licence by a person not in a police uniform, but who alleges that he is a policeman, a motorist should challenge the alleged police officer to produce his police identification card. If the officer produces this card then the automobilist is bound to show his licence, but if the disguised police officer fails to do this we submit that the motorist is not obliged to produce his licence.

The Licensing of Motor Omnibuses.—No mechanism seems to have been provided by the Act of 1903 for appeal from the decisions of local authorities who may, justifiably or otherwise, have refused to license heavy motor vehicles, under which heading of course the motor 'bus at present comes. The Society of Motor Omnibus Engineers has made a recommendation to the Motor Union that evidence on this important question should be laid before the Royal Commission on the Motor Car Acts. It is very doubtful wisdom to allow local bodies of the calibre of which we know them to be at present, to be not merely the first but also absolutely the last deciding authority on so important a question as that of vehicle registration or licensing. Some provision for appeal from the decisions of the local authorities ought certainly to be provided, and it is to be hoped that the Motor Union will press this point of view upon the Royal Commission.

OUR CANALS AND MOTOR BOATING.

(Continued.)

OUR CANALS.—An old bridge over the Basingstoke Canal near Aldershot.

THERE are other considerations. One of the features of the upper Thames which makes it such an agreeable waterway for pleasure purposes is the provision of hotels and restaurants at convenient points. Of conveniences of this kind the Basingstoke Canal is practically destitute, though there are hotels at several points near to it, whose presence no one travelling along it would suspect. Extensions of these establishments on the edge of the canal might possibly be arranged for, and others should certainly be organised. Without places at which tourists can conveniently and comfortably stop for a longer or shorter period and obtain what they want, pleasure-boat traffic will never be a success, but with such arrangements it may almost be guaranteed. It may be taken for granted that the owner of the canal will not be able to satisfactorily rely upon either project alone. Both a regular service of motor boats and the income to be derived from the use of the canal by pleasure-boats must be looked to to recoup expenditure. As regards the

latter the present large number of locks, for passing each of which a charge of 1s. is made, is a very serious bar.

Reducing the number of locks, as we suggest, will probably do something to remove this obstacle, but probably it will be found necessary to reduce the charges. If this is done and profit relied upon rather by the custom which motor-boating tourists will bring to canal-side hotels and restaurants, the scheme might, in all probability, be made thoroughly satisfactory. It is to be hoped that success will crown Mr. Carter's efforts. That this picturesque and beautiful waterway, running through some seventy miles of exquisite country, mostly wooded, should not be opened to a greater extent than it has been to public enjoyment is a misfortune. That it should be found necessary to abandon it altogether would be a disaster, but with a moderate expenditure of capital on the proper lines we trust that any such disaster may be effectively avoided.

We are glad to see that the prospect of goods transport by automobile, which has proved so successful in the near neighbourhood of London, is spreading to more distant counties, and that the Agricultural Organisation Society is considering the feasibility of arranging motor services which will link up remote districts in Lincolnshire, Gloucestershire, Devonshire, and other counties with the railways.

We regret greatly to hear that Mr. Alfred Bird, the prospective Unionist candidate for Wednesbury, and who is so prominently connected with the Automobile Club, met with a rather serious cycle accident on Saturday last. Following the collision with a cyclist, Mr. Bird was thrown on to his head, and badly disfigured his face. We are glad to learn, however, that Mr. Bird is now progressing satisfactorily.

THE TOURIST TROPHY RACE.

Photo by G. B. Cowen, Ramsey.

TOURIST TROPHY RACE.—Port Erin, one of the most popular seaside spots in Manxland.

By the time this issue is in the hands of our readers the Tourist Trophy Race will have been run and won, and people will be forming particular opinions on the event itself and its merits as the possible "blue riband" contest of the future.

No one imagined that the race this year would be likely to prove an ideal event from every point of view; the difficulties of carrying any motoring event to a successful issue are great, but those which stand in the way of instituting an entirely new type of race meeting are infinitely greater. This fact should be borne in mind when criticising the race from the point of view of a

popular event, and also possibly when considering the results which have been obtained from it.

It was only a few days before the event that the club made public their decision that the actual starting line would not be actually at Quarter Bridge but in Alexander Drive, opposite the Woodlands. At the same time it was announced that the winning post would be placed just past the corner of Selborne Road and Quarter Bridge Road. Both starting and finishing points were well chosen. Alexander Drive abuts on the course, and the actual starting point for the cars was, therefore, in such a position that the congestion which always occurs

Douglas Head and Lighthouse.

TOURIST TROPHY RACE.—Two well-known spots on the Island.

TOURIST TROPHY RACE.—Mr. S. Girling on the 18-h.p. Siddeley Car. This is the same vehicle which took part in the famous "Siddeley-Meyan" Tour, and it has already covered about 43,000 miles.

in its vicinity did not in any way interfere with the competitors once they were under way. With nearly fifty cars to send off this is an important consideration, if the circuit is so short that the first car might easily be round again almost before the last has been despatched. The merits of the position chosen for the winning post lay in the fact that it was on an up-gradient, and cars had, therefore, to finish under their own power, a fact which neutralised any advantage being taken of the final run down the mountain road, since any cars which arrived at the bottom empty would be unable to finish the race.

TOURIST TROPHY RACE.—View from above of the 18-h.p. Siddeley Chassis. A feature of the engines on these well-known cars is the variable-lift device fitted to the inlet-valves.

In other respects, too, the arrangements were very thoroughly conceived.

Practice runs were made by many of the competitors prior to the event, but the weather on the whole was not calculated to enable the drivers to really know the course thoroughly or the capabilities of their car for running on a fine dry day. Mr. E. H. Arnott, on his Minerva, had established a reputation for making a series of very fast runs on a reasonably low petrol consumption, while the Rolls-Royce, Arrol-Johnston, and Rover cars were also to the front in this respect.

It was not altogether surprising that one or two accidents happened during these practice spins, for even these comparatively small cars are capable of considerable speed. The most serious smash-up was that of a non-competing Simms car when rounding a curve near Kappel Gate. In a similar way, Mr. De Wilton's Swift was brought to the ground

at another point on the course, but by the enterprise and energy of Mr. Harvey du Cros, it was thoroughly repaired in two days, although very badly damaged in the smash. Another piece of quick work was the building of a new Scout car by Messrs. Dean and Burden, whose original T. T. vehicle met with an accident in Wiltshire, as we recorded last week.

Sunday was the last day on which cars could be taken over the course. A certain religious portion of the population held a meeting of protest that same evening, at which they denounced *reckless Sunday* motoring.

The emphasis was apparently on the *reckless*, but we rather think that the adverse criticism was called forth by *Sunday* motoring as an offence against principles. Otherwise we hardly appreciate the subtle distinction which the Sabbath is made to confer on *reckless* driving, which on holy days or otherwise, is to be sternly condemned.

TOURIST TROPHY RACE.—The Simms-Welbeck Car, before the event, starting from Quarter Bridge for a trial spin.

TOURIST TROPHY RACE.—The two Argyll Cars, which are of the live-axle type, and have four-cylinder engines. Three changes of speed are provided, the change-speed-gear and its three-way "quadrant" being one of the special features of these well-known vehicles.

The Results of Our Road Trials.

(Continued from page 1118.)

IN our last issue we published, in tabular form, the fuel consumption figures showing, amongst other things, the effect of speed on the quantity of petrol consumed by some of the best known types of petrol car. We now propose to turn our attention to the individual records obtained from each vehicle, mentioning such special characteristics as should be borne in mind when considering the figures, and referring specifically to the precise conditions that prevailed at the time.

The exact nature of these tests, which were carried out by our own technical staff, has already been stated, in the first portion of this article, last week.

TOURIST TROPHY RACE.—The 16-h.p. Arrol-Johnston car. This vehicle is a most striking departure from the standard "dog-carts," which have for so many years been associated with this firm. The balanced, horizontal engine, however, is of similar design, although differently arranged in the frame, and a propeller-shaft drive to the live rear-axle has been adopted.

The 14-h.p. Wolseley.

On this twin-cylinder car, the horizontal engine was controlled by a hand throttle-valve, by which the richness of the mixture is automatically maintained more or less constant to suit the load. The carburettor and throttle-valve, which are in this case of the latest Wolseley pattern, must necessarily on any car be largely responsible for the nature of the fuel consumption figures; on their adjustment, moreover, depends to a great extent the fuel efficiency at different speeds and different loads. On the level course, even when the fourth gear was in use, the

TOURIST TROPHY RACE.—The Arrol-Johnston chassis, which is principally remarkable for its peculiar horizontal engine. Each of the two cylinders—which lie transversely in the frame—have a pair of independent pistons which operate the longitudinal crank-shaft, lying immediately below the cylinders, by means of rock-levers. Hitherto these engines have been associated with the well-known Arrol-Johnston "dog-cart," of which a description appeared in our issue of April 4th, 1903.

TOURIST TROPHY RACE.—The two 14-h.p. Dennis Cars. Although identical in power, one of these vehicles has a two and the other a four-cylinder engine. Both cars are peculiar for their worm-driven live-axle—the special feature of all Dennis vehicles.

TOURIST TROPHY RACE.—The Dennis change-speed-gear, the special feature of which is the automatic disengagement of the lay-shaft at the same time that the "direct" through-drive is introduced. The direct-drive is obtained by sliding the member, C, on the driving-shaft, A, so that the jaws, C¹, engage with the corresponding jaws, B¹, on the driven member, B. Normally, however, the jaws, B¹, are engaged with corresponding jaws on the wheel, D, which is driven through the wheel, E¹, by the lay shaft, E, and it is only by sliding back the wheel, D, that the jaws, B, are free to engage with those on the sliding member, C, in order to give the top gear. This sliding of the wheel, D, is accomplished by the contact between the two smooth faces, D¹ and C², on the respective sliding members, and the re-engagement of the wheel, D, with the driven member, B (when the gear is changed down again), is provided for by the spring, D².

hand-controlled throttle-valve was more or less closed during each run, and therefore the full efficiency of the engine could not be made use of during either run. Nevertheless, it will be seen that on the fourth gear the fuel consumption was lowest at the lowest speed (14.6 m.p.h.), and that only 23.3 miles per gallon, as against 32.6 miles per gallon, were made when the speed was increased to 22.7 m.p.h. As might be expected, even more petrol per mile was consumed on the third, and still more on the second gear, while the consumption rate per *hour* followed more or less closely the engine speed. A very interesting result is that an improvement, amounting to nearly two miles per gallon, was effected in the final "level" test, although a slightly higher average speed was made, and the engine was working above its "best"

speed. This was due to opening up the throttle-valve wide for short periods of time, and then almost closing it to allow the speed to decrease. This "jerky" method of driving obviously improved the average efficiency, which may be accounted for by the fact that when the engine was working at all it was taking in full charges of mixture, and was not running continuously with a partly closed valve, as before.

On the hilly course, the first two tests, curiously enough, showed up in favour of running on the second, as against the third, speed, although the engine made nearly 50 per cent. more revolutions during approximately the same time. One sees, therefore, that, at such a low engine speed as was maintained when the higher

TOURIST TROPHY RACE.—View of the 14-h.p. Vinot-Deguingand Car, which has a four-cylinder engine, and is driven by side chains. A peculiar feature on this car is the change-speed lever, the trigger on which is used for locking the lever to either one of the two rock-shafts which operate the sliding members in the gear-box.

TOURIST TROPHY RACE.—The 16-h.p. Humber car, fitted with a well-designed side entrance body.

gear was used, the loss of efficiency from this cause more than cancelled the gain due to increased load. In the next two tests—in which the relative merits of running at about 20 m.p.h. on the third, and on the fourth gears, respectively, is shown—not only is a further anomaly at first apparent, since, even then, the fuel consumption is higher than in the second run, but the fourth gear fulfils expectations by being much more economical than the third gear. The third gear would seem, in this case, to be uneconomical because the speed is unduly high in view of the partly closed throttle-valve, for apparently—as will be shown by our engine tests presently—not only is the efficiency of an engine always impaired by throttling, but if the throttle-valve is partly closed, the effi-

TOURIST TROPHY RACE.—View from above of the 16-h.p. Humber chassis, which is of the live-axle type and has a four-cylinder engine. The peculiar one-armed steering-wheel, prominent in this illustration, is a feature of all Humber vehicles.

fact is that the revs. per min. are deceptive, because the actual speed was varied over a very wide range, and at times a high, and therefore very wasteful, rate of travel was attained to compensate for the frequent slackening around corners, and the comparatively slow speed up the steepest gradients.

The 6-h.p. Wolseley.

With the smaller Wolseley car, which has a single cylinder of the same size as those on the 14-h.p. vehicle, trial runs on the level course were only made on the top gear (the third speed), and the results obtained will show how important it is, from a fuel consumption point of view, not to attempt to travel too fast. The normal speed is 800 revs. per min., and, with this car, a greater proportional load was naturally imposed on the engine. At 930 and 950 revs. per min. the drop in mileage per gallon was, it will be seen, no less than 8 miles, or, in other words, twenty per cent. less. Probably the reason why the consumption per mile is the same at 15 m.p.h. as at 19½ m.p.h. is that the reduction of wind-resistance about compensated for the

TOURIST TROPHY RACE.—Mr. Guy Lewin on the 10-h.p. Peugeot, which is one of the least powerful of the competitors. It has a twin-cylinder engine and is driven by side chains; four changes of speed are provided. "Shock-dampers" are fitted.

less economical (below normal) engine-speed.

On the hilly course, the results confirm the same conclusions that are deducible from the 14-h.p. car tests, and it only need be pointed out therefore that the third gear at $15\frac{1}{2}$ m.p.h. is more economical than the second gear at $16\frac{1}{4}$ m.p.h., because the total number of revolutions are greatly less. In neither case, however, is the efficiency as high as it would be at normal engine-speed. In spite of the greater wind-resistance at 20 m.p.h., the result obtained in the final run is distinctly better, the average engine-speed having been 820 revs. per min., as against 625 and 980 respectively.

The 15-h.p. Napier.

On this car, two methods were available for regulating the power and speed of the engine. Usually the

TOURIST TROPHY RACE.—Mr. E. W. Lewis on the 16-h.p. Rover car. In general design, this vehicle—first introduced to the public at the Brighton Meeting—follows the lines of the small two-seater, which has already become so well known.

The mileage per gallon fell from 27.2 to 21.8. No intermediate speeds between 23.75 and 29.75 were tested, but these two results show how rapidly the economy per mile is adversely affected by fast travelling.

The first two tests on the hilly course indicate the difference in fuel consumption resulting from maintaining a steady speed of 17 m.p.h. by the hand throttle, and of 20 m.p.h. by the clutch and governor; in the first case about 10 per cent. less petrol was required per mile. Finally, in the series of three, it was shown that an equivalent further gain resulted from employing the

TOURIST TROPHY RACE.—The 16-h.p. Rover chassis, which has a four-cylinder engine and a live-axle. The 3-speed gear-box and the crank-chamber are combined, and are fixed at three points to the frame. The steering mechanism is one of the most peculiar features on the chassis, wire cords wound over a drum being employed instead of the usual gear.

governor was allowed to come into play for the purpose, and it is set so that it gives what may almost be termed a "hit-and-miss" action on its throttle-valve as soon as a speed of 800 revs. per min. has been reached. The governor could, however, be completely cut out by depressing a pedal, and a hand throttle-valve, which—unlike the other throttle—tends to maintain a constant richness of mixture, formed the second means of control. The normal speed of this engine was 1,200 revs. per min., and the maximum useful speed may be taken as 1,600 revs. per min.

On the level course, the first two tests were made in order to ascertain how much extra fuel would be consumed by driving the car "on the clutch," as against letting the governor "cut in" and "cut out" as it pleased—i.e., leaving the clutch in continuously.

TOURIST TROPHY RACE.—One of the Minerva cars, which have four cylinders and are chain-driven. A feature of these vehicles is that although four speeds are provided, the direct drive to the differential countershaft is on the third speed.

TOURIST TROPHY RACE.—Elevation and plan of the new 14-h.p. Thornycroft Engine, fixed in place on the chassis. All the valves are arranged above the cylinders, and the cam-shaft lies in the casing, C, alongside the cylinder-heads, being driven by a bevel-wheel from the vertical shaft, B, which carries the automatic governor, B'. The commutator, D, is driven from the cam-shaft by means of the bevel-wheels contained in the case, D'. The carburetor, A, and the low-tension magneto, E, are also shown in the drawing, although the very neat tappet mechanism, which enables either valve to be removed easily, and is operated from the cam-shaft, is not visible.

fourth gear instead; the speed of the car was then slightly greater, but the advantage of imposing a heavier load on the engine more than compensated for this.

The 15-h.p. De Dion.

On this car, the high-speed engine was controlled in most tests by the exhaust-gas-retaining device employed on all De Dion vehicles, but during one run the hand-operated throttle-valve was used instead. The two performances on the level course show the advantages that are obtained by working at full load and at normal engine speed, for it will be observed that although the car

was travelling fast during the second run—and the wind-resistance was therefore considerable—the amount of fuel consumed was reduced by over twenty per cent.

The first three tests on the hilly course were made at practically the same speed, and they therefore serve to indicate two main things. Firstly, it is seen that no material difference was made by using the hand-throttle in lieu of the foot control on the exhaust, so that apparently the automatic maintenance of an approximate constant richness (in the former method) compensated for the decreased compression in the cylinders. Secondly, the gain resulting from the reduced total number of revolutions, and from working at a more moderate speed, is very marked when the third speed was brought into use instead of the second. The fourth run emphasises the merits of full-load working, since the same quantity of petrol served to cover the distance at an appreciably higher rate of travel.

The 6-h.p. De Dion.

The characteristics of a car fitted with a single cylinder engine that has a very high normal speed are brought out very strongly in that portion of our table which refers to this car. On the level course, the economy was equally good at 14 m.p.h. and at 25 m.p.h., but was not nearly so high at the two intermediate speeds. The explanation probably is that the full load in the last run more than compensated for the more moderate engine speeds in the second and third runs, while, during the first trip, the comparatively low engine speed and the exceptionally light load had an equivalent effect. A good deal more light is thrown on this series of trials by the tests made by us with a similar kind of engine on the bench; these go to prove that the rate of fuel consumption per *hour* is very much lower both at low and at very high speeds than it is at intermediate speeds.

On the hilly course, the two runs were made at about the same speed, but in the one case the second gear was used, and in the other case the third gear. The employment of the latter proves to be, as anticipated, a considerably more economical method of driving.

The Cadillac Cars.

Two separate cars, differently "geared," were employed. The inlet-valve of the Cadillac engine is "set" in an unique manner.

TOURIST TROPHY RACE.

The power and speed are controlled by varying its "lift"—opening it earlier and later, and at the same time closing it later or earlier—but the usual feature is that, at full load, the valve does not close until the piston has proceeded some little way on its "compression" stroke. The effects are most interesting, but it is only the practical results, as shown by the performance of the car, that we can enter into here.

TOURIST TROPHY RACE.—Mr. A. Rawlinson on one of the 10-h.p. Darracq cars, which have twin-cylinder engines and live-axles.

With the lower-gear car on the level course, it is seen that the same efficiency per mile is maintained on the high gear so long as the normal engine speed is not exceeded, but that at higher speeds more fuel is consumed.

The same thing is also borne out by the tests made with the other car, though the all-round efficiency is even then better, and although the mean engine speed

TOURIST TROPHY RACE.

on this second occasion never exceeded 973 revs. per min., as against 1,220 revs. per min. before. Only one test on the hilly course is recorded in the table, this

giving a direct idea of the effect produced by the altered nature of the route, since it is otherwise comparable with the second run on the level.

(To be continued.)

SCIENTIFIC GOGGLES.

IN the last Gordon-Bennett Race the dust was almost phenomenal, in fact it was so bad that Earp especially, among the English team, could hardly see at all during the latter part of the race on account of the quantity which had found its way into his eyes. In striking contrast was the immunity of the French and Italian drivers, who were observed to be wearing small close-fitting glasses of an unknown type, which apparently made an hermetic joint around the eyes, and yet never clouded with mist because of the specially arranged little pipes which conducted the air to and from the interior of each monocule without admitting dust at the same time.

carefully shaped, so that their curvature conforms to the average anatomy of the face in the region of the eye; differences in detail being compensated for by the soft rubber edging which is sewn to the frame to prevent its direct contact with the face. Detachable ground-glass lenses are fixed in front, and either clear or tinted glasses may be inserted as required. The bridge, B, joining the two frames is made adjustable and, being mounted on ball and socket joints, B', perfect freedom is ensured for the two virtually independent halves.

Ventilation is provided by the two rearwardly projecting pipes, A and A', the former passing through the frame and along towards the centre, where it delivers its supply of fresh cool air, the latter stopping short just inside the frame for the purpose of drawing off all the warm air from the interior. We have recently taken an opportunity of testing these goggles during dusty weather, and the protection which they afford against the annoying and painful ingress of solid particles is undoubted. They are very easily adjusted, but it is necessary that they be adjusted exactly, for otherwise there is a risk that they may be neither dust-tight nor really comfortable. Many motorists who wear glasses for defective vision find a difficulty in obtaining suitable goggles to wear with them, and it is interesting to note that the Mirovitch goggles can be fitted with special lenses, which the manufacturers undertake to produce as an exact equivalent of those usually worn in *pince-nez* or spectacles.

MIROVITCH GOGGLES.—Views of the new goggles from the front and from behind, showing the ventilating pipes, A and A', by which the air is kept in circulation without admitting the dust.

These new goggles are the invention of Dr. Mirovitch, and the sole agent for them in this country is Captain W. H. Bennett, of Dixi Motors, Limited. Our photographs show two views of the goggles—from the front and behind respectively. The frames are of aluminium,

ONCE upon a time it would have been regarded as a proof of much enlightenment for a Chinaman to desire to marry a European. Such a marriage at the present day has to be conducted "en automobile" to attract attention, and this was the case with the wedding of Mr. Sci Ton Fa, of the Middle Empire—he has married a French lady—and he drove to church in Paris in a motor car to have the fatal—we mean festal—ceremony performed. When Mr. Sci Ton Fa was "spliced" the music should have been provided by a Tonic Sol Fa choir, but we do not know whether this was so or not!

THE ALBION LUBRICATOR.

So much public attention is being drawn at the present time to the "smoke nuisance," caused by improper lubrication of motor car engines, that inventions relating to lubricators, designed to relieve the driver of anxiety as to the condition of his exhaust, now assume additional importance to the motorist. In this respect lubricators in which the oil-feed is dependent upon the action of a pump are receiving increasing favour, and several of the best known cars are now fitted with lubricating devices of this type, among them being the Albion, the mechanical lubricator on which car has been designed by Mr. T. Blackwood Murray.

In a very ingenious manner Mr. Murray has made a multiple-feed lubricator of this type, which occupies a very small space and is operated by remarkably simple mechanism. To ensure satisfaction in a device of this kind it is desirable that the oil supply to each pipe should be delivered positively and independently, so that the pressure may be rendered as effective as possible in causing proper circulation even in the event of slight obstructions, and that the amount of oil which

circle so that they may be supplied with oil from a single pump, which is constructed to travel over a corresponding circular path and deliver its charge as it comes over the end of each pipe; a fresh supply of oil—the quantity of which may be regulated at will—being automatically drawn out of the reservoir, as the pump passes across the intervening space between any two adjacent pipes. The motion of the pump in its circular path is controlled by a ratchet device operated from the engine, but a handle is also fitted by which the driver can operate the pump at such times as he may consider that an extra supply of oil is temporarily necessary.

Passing through the centre of the reservoir is a spindle, D—on the upper part of which is the handle, D¹, for temporarily working the pump by hand—which forms an axis about which the plate, F, carrying pump, E, revolves. The pump cylinder is solid with the plate, F, which is keyed to the spindle, D, and the plate is provided with ratchet teeth on its periphery to enable it to be rotated by a pawl, G¹, which is operated by means of suitable mechanism, G, from the engine. Fixed to the bottom of the re-

Fig. 1.—The Albion Lubricator. View of the apparatus complete.

Fig. 2.—The Albion Lubricator. Views of the pump mechanism and the interior of the reservoir.

Fig. 3.—The Albion Lubricator. Views of some principal component parts of the mechanism.

is so delivered should be readily controllable without interfering with the supply to each other pipe in the system. These are features of the new Albion lubricator of which we give several illustrations. In Fig. 1 the lubricator is shown complete, in Fig. 2 the cover with part of the mechanism has been removed intact from the reservoir which is seen beneath it, and Fig. 3 gives views of the more important details in the construction. Fig. 4 is a sectional elevation, showing the relative arrangement of the parts, and Fig. 5 indicates diagrammatically the action of the pump during the suction and delivery strokes.

In the lubricator from which our illustrations were taken there are six separate oil pipes, B, leading from the reservoir, A, and they are arranged in the form of a

reservoir, A, is a plate, B¹, into which all the oil-pipes, B, are screwed from beneath, and it is so constructed that between each two adjacent holes, B³—which communicate with the oil-pipes—there is another hole, B², communicating with the reservoir, all the holes being drilled on the same "pitch circle." Against the upper face of this plate, B¹, the lower face of the plate, F, is held, by means of the spring, F¹, so that they form an oil-tight joint. The pump-cylinder, E, is not fitted with any valves, and oil can only enter it when its lower end, which is quite open, comes opposite one of the holes, B², communicating with the reservoir, after which the supply is automatically cut off by the movement of the plate, F. The pump thus

carries its charge until the cylinder comes over the next hole in the plate, B', through which the oil is delivered to one of the pipes, B.

The reciprocating motion of the pump plunger, E', is accomplished in an ingenious and yet very simple manner. Attached to the inner face of the reservoir cover, A', are a series of conical cams, C, and flat stops,

Fig. 4.—The Albion Lubricator. Sectional elevation showing the arrangement of the pump inside the reservoir.

Fig. 5.—The Albion Lubricator. Diagram illustrating the manner in which the plunger receives its reciprocating motion from the cams, C, as the pump is carried bodily forward.

THE BURTON RADIATOR.

The Burton Radiator, showing its general appearance, and the auxiliary air-pipes which honeycomb the lower water chamber.

ALTHOUGH of the water-tube type, the Burton radiator differs considerably from others of this class. It has, it will be noticed from our illustrations, no radiating gills on the tubes, and the tubes themselves are angular in section. The object of making the tubes in this way is to reduce the water space relatively to the cooling surface as much as possible, and the makers have considered it advisable to adopt an angular section instead of the more usual flattened tube. Only the front of the tubes are thus in direct contact with the moving air, but an additional draught is directed upon the rear faces of the tubes by honeycombing the lower water-chamber with small pipes, C (Fig. 3), each of which leads the air, collected by a "scoop" below the radiator, to the angular space behind each water-tube. The arrangement of these short pipes is well shown in one of our illustrations, and it will be noticed that they have the additional advantage of converting the lower water-chamber itself into a small honeycomb radiator.

Elevation, sectional plan, and details of the Burton Radiator. A, delivery pipe; B, overflow pipe; C, auxiliary air-pipe; D, water tubes.

THE MANOGRAPH—ITS UTILITY AND CONSTRUCTION.—PART I.

It is little short of a miracle that the modern petrol engine works at all, for it is surely almost inconceivable that each of the four strokes constituting the complete cycle of operations can be performed in less than one-fortieth part of a second—acting perfectly thirty-six thousand times hour after hour—particularly when one considers that a flame fills the cylinder during the exhaust-strokes, and that its place is taken by an unignited explosive mixture *immediately* afterwards. That this fact is far from being appreciated by the average owner of a petrol car, and probably by not a few manufacturers as well, may indeed be, and in fact is, an eloquent testimonial to the extraordinary success of such engines in practice, but, further than this, it suggests an ample explanation as to why some engines work very much better at one time than at another, and why some engines give very much better results than others of the same size. When one attempts to consider what is actually taking place in an engine, when running at about this speed (1,200 r.p.m.), one cannot but realise that it requires something more than a minute inspection of the mechanical

Fig. 1.—View of the Manograph mounted on its tripod, with the ground-glass screen, A, partly withdrawn. The pipe, B, communicates with the combustion-chamber of the engine, the flexible-shaft, C, transmits the motion of the crank-shaft to the instrument, and the rubber pipe, E, leads the acetylene gas to the lamp.

parts—coupled with the exercise of a vigorous imagination—in order to ascertain how to secure the best results from it. There are such a large number of complicated calculations involved in attempting to determine, by theory, the correct dimensions, and “set,” of each and every part, that, even if all the necessary data were to hand—and they are not—it would be far from easy to avoid making some serious mistakes. Everything occurs in such an extremely short period of time, temperatures and pressures vary over such an extremely wide range, and many of the functions are of such a very complex character, that, even if the engine were intended always to run at one constant speed, the correct “setting” of the valves, and adjustment of the carburettor—to say nothing of the other hundred and one minor matters—would be but little more than guesswork, unless some direct means were available for ascertaining what was actually taking place inside the cylinder. To a certain extent, it is possible—on the principle of “trial and error”—to gradually obtain such data by experiment, and fortunately there is usually no lack of visible or audible

symptoms which are fairly easy to diagnose. Unless, however, some accurate records are available from which can be seen, separately, what has happened during each part of the cycle of operations, it would be impossible to know whether a further improvement might reasonably be expected or not, and one could not expect to take full advantage of such comparative data as would otherwise be available from other engines. It is, at any rate, obvious that the surest means of obtaining the best results from any petrol engine, or of ascertaining the cause of any faulty action that may have arisen, is to obtain some mechanical record that will show precisely what has been occurring inside the cylinder when the engine is running, or, in other words, to obtain a set of indicator diagrams from it. Unfortunately, until comparatively recently, there has been no satisfactory instrument for enabling accurate diagrams to be obtained from engines running at such high speeds, for not unnaturally it has been found extremely difficult to construct an indicator which will give reliable diagrams from a modern petrol engine. Indicators in the past, however, delicately they may have been made,

have had certain moving parts which have been too heavy to act properly at such speeds, both because their inertia has prevented them from getting under way sufficiently quickly, and because their momentum has caused them to travel unduly far. The result has been that all attempts to use these instruments have resulted merely in obtaining distorted and misleading diagrams.

The Carpentier-Hospitalier manograph is an apparatus of an entirely different kind, although it gives precisely the same type of diagram. In it, the previous difficulties have been almost entirely overcome, not only by making the moving parts extremely light but also by reducing their range of travel considerably. There is no pencil of any kind for drawing the diagram, and there is no paper which has to be moved beneath the pencil, while a still further difference between it and ordinary indicators is that a diaphragm replaces the customary piston and its small cylinder. Instead of the pencil, a beam of light is made use of; instead of the paper, there is a ground

glass screen, or a photographic plate; the beam of light is obtained from a stationary lamp, that forms a part of the apparatus; and the screen on which the diagram is projected does not move. All these obvious advantages are obtained by the simple expedient of using a small circular, convex mirror, which is little more than half-an-inch in diameter, and merely serves the duty of reflecting the beam of light on to the screen. The mirror, or reflector, is pivoted in such a way that it can be tipped sideways by one portion of the mechanism, and can be tipped in an upward and downward direction by another portion, the mirror normally lying in a vertical position in the instrument, and its centre remaining practically a fixed point. The mechanism that tips it sideways is driven from the crank-shaft of the engine by a flexible shaft, and is so arranged that the horizontal line which it causes the beam of light to traverse, across the screen, corresponds with the forward and backward movements of the piston in the engine-cylinder; the beam of light thus keeps time with the piston in just the same way that the paper does beneath the pencil in an ordinary indicator.

The other mechanism, which rocks the mirror about its centre in a direction at right angles to this, is operated by the pressure in the combustion-chamber, and is for this purpose connected with the engine by a pipe; it causes the mirror to move the beam of light over a vertical path up and down the screen, and, therefore, the vertical position of the beam on the screen corresponds with the pressure in the cylinder, in just the same way that the vertical position of the pencil does in other indicators. It will, of course, be understood that the mirror can be tipped in both directions simultaneously, and that the beam of light can, therefore, "draw" a diagram of the usual type upon the screen.

When the engine is running sufficiently fast, the complete diagram is "drawn" so quickly that the whole of

it is rendered visible to the eye on the ground-glass screen, and the retina receives a complete image—the diagram standing out as though formed by lines of light. It is then possible to watch all changes that may be taking place, actually at the time, inside the cylinder, though obviously, in this case, there is no permanent record produced, and it is necessary to rely on memory for results. Permanent records can, however, be obtained by substituting a photographic plate for the ground-glass, this plate being, of course, subsequently developed as an ordinary negative. The same photographic process is also employed when the speed of the engine is insufficiently great to permit of the other method being adopted. Before passing on to describe the construction of this very beautiful instrument (for which Messrs. Van Raden and Co., of Coventry, are the English agents), it might be as well to draw attention to the fact that the diagrams produced by it are primarily intended for enabling the internal action of an engine to be seen, and that they are not so well suited for calculating the horse-power that is being developed. We mention this because it may not, at first, be evident to those taking

an interest in this subject that the very nature of the mechanism almost renders absolute accuracy impossible, so far as "scale" is concerned. It would, for instance, be necessary to alter the construction slightly for engines that have connecting-rods of greater or less length. The great point, however, is that the diagrams obtained are accurate so far as "phase" is concerned, *i.e.*, that they show what the precise nature of the changes of pressure are inside the engine, and what the precise moments are at which such changes take place. But this, after all, is really the important function of any indicator for such work, and it therefore matters not that additional labour would be required from those wishing to calculate "indicated horse-power" from the diagrams.

(To be continued.)

Fig. 2.—Four views of that portion of the Manograph which contains the moving parts, dismantled to show the interior mechanism. To the left at the top, it is seen from the front, with the diaphragm, B², and the adjustment screw, C¹², lying alongside; to the right, it is shown from the back, with the mirror, D, in full view, and with the union plug, B¹, beneath; in the lower left-hand corner, a view is obtained from above, with the cover plate taken off; and in the right-hand corner, an underneath view is given.

In the centre, at the bottom, is the prism, E².

REVIEWS OF BOOKS.

"Ellan Vannin. Ballads and Verses of the Isle of Man."

By HARROLD JOHNSON.

(London: Watts and Co. Douglas: Broadbent and Co. 1s. net.)

THE Isle of Man is to some extent becoming the Mecca of motorists, so, as these poems are largely vignettes of Manx life and scenery, the automobile movement may be expected to benefit their sale. There are those at any rate who will be glad to supplement their photographs or views of the island by vignettes in words of its scenery, life, and people, and it is these that Mr. Harrold Johnson has set out to supply—often very successfully. He has the true poet's insight and feeling, and as we read his verses we are irresistibly reminded here and there, at times of Tennyson's "Miller's Daughter" and at times of Burns. As yet he has not that full command of rhyme and rhythm without which the deepest poetical feeling and insight are, after all, but like the "Harp on Tara's Walls." The last poem but one in the book, however, "Ellan Vannin," has the true lyric "lilt" and swing, and leads one to hope for good things from the author in the future. Beethoven at the end of his life said to Moscheles, "I have not studied enough." The poet needs to study as much as the musician if his inspiration is to become really articulate. *Verb. sap. sat*

My Friend the Chauffeur.

By C. N. and A. M. WILLIAMSON.

(London: Methuen and Co. 6s.)

IF we alter Byron's epigram—"God provides the widows and fatherless with fools"—into "God provides impecunious British aristocrats with American heiresses," it would form a suitable motto for this book. Lord Terence Barrymore, heir to a marquise in the peerage of Ireland, and incidentally owner of a 12-h.p. Panhard, has run through all his money, and his friend, Sir Ralph Moray, determines to help him out of his difficulties by inducing him to take a party of American ladies touring through Europe, at a very comfortable remuneration to himself. This position forms the plot of "My Friend the Chauffeur," and its development can be imagined. The mechanism and movement of the story is somewhat interfered with by its sub-divisions into five parts, told respectively by the three American ladies on the tour, by Sir Ralph Moray who arranges it, and by Lord Terence Barrymore, who takes the part of the chauffeur. One cannot help feeling that the effect would have been improved if this particular sub-division had been abandoned for a general progressive novel in either the first or third person. But when we have said this, we have said all that can really be alleged against the book. Other attempts at motor car novels have previously appeared. This is far and away the best of them that we have seen. There is real character-interest and real adventure, and, above all, what ought to be present to make the new method of travelling provide the pleasure it ought to do to its votaries, an appreciation of the scenery and historic associations through which the tourists are conducted. That portion of the book is altogether admirable. The characters of the story are a wealthy American widow (doing young), her daughter, who is doing younger to keep up the illusion, a beautiful American heiress, very cultivated and refined, though painfully pious, the two gentlemen we have referred to

above, and a wicked Austrian count—the villain of the piece—who finally attempts to kidnap the heiress and is pursued and discomfited by "my friend the chauffeur"—to wit, Lord Terence Barrymore. It would not be fair to say anything further about the plot, but the work, as already hinted, combines, in a pre-eminent degree, a certain chatty character of interest with a very profound appreciation of the natural beauty and associations of the countries visited, particularly the north of Italy. Some of the descriptions possess a really remarkable power, and that of the approach to Venice by road and gondola from Padua is a piece of descriptive writing which no one can ever read and forget. Here, as elsewhere throughout the book, the special charm of automobile travel, that it enables the traveller to see the country and all it presents yard by yard and almost inch by inch, emerges triumphantly, and, after all, an automobile story cannot do better than that.

English-French and French-English Dictionary of the Motor Car, Cycle, and Boat.

By FREDERICK LUCAS.

(London: E. & F. N. Spon. 5s. net.)

THE prominent position held by France in automobile manufactures renders a good, reliable, and practical French and English dictionary of automobile terms an important desideratum, and we accordingly welcome the present very conscientious attempt to tackle what is a singularly difficult problem—the adequate corollation of the technical terms of the two languages. Dictionary-making, from the time of Dr. Johnson to the present day, has always been recognised as a most thankless undertaking. Where the dictionary-maker is right he gets little thanks, and where he is discovered to be wrong every man's hand is against him. The best commendation that can be bestowed on the present work is that we have been able to detect but few errors. One of the most common terms in connection with a change-speed-gear has been rendered in English by the French term. We allude to "train balladeur," which is rendered by "balladeur train," which conveys no more information to anybody. When the next edition of the work comes out, we hope to see this rendering altered into "sliding-gear-train," which is what it really is. The dictionary comprises the usual two parts—English-French and French-English.

"North Wales Cyclists' and Tourists' Guide."

(Bradford: "T. Thrupp. Price 6d.)

THIS little guide, which is published at 6d., possesses an excellent map, and the information given in the various itineraries, which cover nearly the whole of the country dealt with, is concise and to the point. The arrangement, however, leaves a good deal to be desired. For instance, the description of Llangollen itself is not to be found under the heading of the "Vale of Llangollen," where it naturally belongs, but comes in one of the itineraries, and the illustration given is wholly unworthy of the place, being taken altogether from the wrong side of the valley. The illustration of Conway Castle, too, makes that grand, gloomy, and majestic old pile look almost ridiculous. Nor should a guide to North Wales dismiss Chirk Castle with the mere notice, "Chirk Castle is situated on Offa's Dyke, near Ceiriog Glen."

CORRESPONDENCE.

AUTO-CYCLE CLUB AND MOTOR CYCLING CLUB.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—During the past three weeks a number of paragraphs have appeared in the Press, and many circulars have been issued by the A.-C.C. relating to the affairs of the Motor Cycling Club. My committee hope that motorists and readers of your paper who may not be acquainted with the whole of the facts will suspend their judgment until such time as they have heard the arguments from both sides. Naturally my committee takes great exception to the threats thrown out broadcast by the A.-C.C., although it regards them as quite ineffective and purposeless. As far as this current year is concerned, the A.-C.C. has succeeded by means of what my committee believes to be doubtful expedients in spoiling the team competition for the "Motor Cycle" Challenge Cup, and this is a matter for which the donors of the cup have to thank them. We in the Motor Cycling Club are only the trustees of the cup, the annual competition for which we regulate and administer under a trust deed, which provides amongst other things that the competition must be held annually. In this deed drawn up by the Hon. Solicitors, J. B. Mackey and F. Purchase, the conditions under which the teams of various clubs are to compete are definitely set out. The Auto-Cycle Club as a governing body is not mentioned in the deed, and all that the Motor Cycling Club has done in the past is to attempt to carry out these conditions faithfully.

As trustees of the cup, this club does not regard itself as the winners of it this year; we are good sportsmen. The Motor Cycling Club will hold the cup until next year, when it will be again put up for competition. As regards the Brown Cup, the A.-C.C., in their haste to snatch an advantage, has made a false step. My committee has made this event a club event, and reduced the entrance fee to 5s. It is hoped the success of last year will be repeated. I may add that in the Brown Cup competition last year every competitor except one was a member of the club, and that one non-member has since joined. If any manufacturers of an all-British machine find a difficulty in providing a driver who is eligible, my committee will give facilities for the election of any suitable person nominated by them. As regards the future, the Motor Cycling Club will never acknowledge the A.-C.C. as other than a competing social club, until it ceases to be so and occupies itself with the functions of a governing body only. This is but reasonable. Clubs in the provinces may not feel the injustice so keenly as our own members do, but we are quite resolute in the determination not to support, financially or in any other way, a competing social organisation in our own city.

Thanking you on behalf of my committee for the courtesy of the use of your columns, I am, yours faithfully,

ARTHUR CANDLER,
Hon. Sec. Motor Cycling Club.

September 2nd.

TOURIST TROPHY RACE.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—It is interesting to note that a great many of the cars entered for the above race are now being withdrawn on some pretext or other, and it would be more interesting still to hear the extent of the special designs of carburettors and gears, &c., that have had perforce to be adopted on those cars which will eventually compete.

One reads of specially geared-up "top speed" for economising petrol consumption, and of other important and radical changes from the usual standard models of the entrants, so much so, that the private purchaser on the result of the race will have to make careful note to ensure receiving an identical car, and even then it is difficult to realise that they will be practical for hard work and the usual trying conditions in a private user's hands.

Most of the best firms have now perfected their productions to such an extent that it is almost always possible to run approximate miles to the gallon, or, at any rate, near enough to satisfy the most exacting users.

We refrained from entering a "National" car in the race for the reason that the general conditions and regulations do not seem to us to be fairly drawn up, not only from the manufacturer's point of view, but for the general public, as it leaves so many loopholes for making "freak" cars or faking.

On a consumption test, we have no hesitation in asserting that the "National" would be a very close runner to the best of any

other make of a similar cylinder capacity, and whenever consumption trials are held for guaranteed standard models, we shall be one of the first to support any such trial.

We shall scan your pages carefully for news and information regarding the special alterations that have necessarily been made in the chassis and body designs to bring the cars into competing form.

We are, Sir, yours truly,

September 5th.

LAMB BROS. AND GARNETT.

To the Editor of THE AUTOMOTOR JOURNAL.

Sir,—Being convinced that motor racing with high-powered cars is impossible in this country, and that something on the lines of the Tourist Trophy Competition is the only useful form of race possible, I have entered a Standard car. I cannot, however, be blind to the fact that the race puts a premium on excessive speed down hill. It also seems somewhat absurd to limit the weight, as if the race is to help in the development of the perfect car, by encouraging efficiency, surely the constructor who can, on his limited petrol allowance, propel a larger weight should be allowed to do so, especially as the increased weight of modern touring cars is largely due to longer and heavier springs and tyres, the advantages of which must be sacrificed by the constructor who has to reduce his chassis weight to come within the weight limit. Doubtless this year's race will be an experiment, but I think all who realise the requirements of the motor tourist will admit that the conditions are not such as to encourage average speed and comfort, the tourist's two chief requirements. The latter cannot be taken into account in a race, but the weight limit, for the above reasons, regarding tyres and springs, is undesirable.

As to average speed, the required car for general touring purposes does not want extremely high gears for downhill work, nor does it require these to be operated by a separate lever. It appears that in the Tourist Trophy event, a car may make an average speed which may appear very good, and attain it by excessive speed down hill. My idea of a useful competition would be to time the cars at various points on a mountainous road, and only race on uphill stretches, the downhill portions of the course to be controls in which a minimum speed should be fixed. Cars would have to keep up touring speeds downhill, say, 20 miles an hour, and the petrol consumption basis might still hold good. Possibly, however, the chance of accidents downhill under present conditions will prove too attractive for any less exciting form of race to be adopted.

Yours faithfully,

August 30th.

R. W. MAUDSLAY,
THE STANDARD MOTOR COMPANY, LIMITED.

40-h.p. Crossley Car.—Among next season's cars will be an important addition to the well known Crossley vehicles, with which Messrs. Jarrott and Letts have done so much business since they introduced them to the motoring public at the Crystal Palace Exhibition in 1904. The new car will have a 40-h.p. engine, four speeds and a reverse will be provided by a gear-box of the Mercedes type, and the rear wheels will be chain driven as in the smaller model which we described in our issues of January and February, 1904. Very long springs will support the frame at either end, those at the back being 4 ft. in length. Ball bearings will be fitted throughout the transmission, the foot-break on the differential countershaft will be water-cooled, and the clutch will be of the same internal expanding pattern as that now in use. In designing the chassis full account has been taken of the most up-to-date automobile practice, and this, coupled with recognised excellence of both workmanship and materials, as evidenced by the performance of the Crossley cars already in use, should ensure an immediate popularity for the new vehicle, which, by the way, is mainly being put on the market "by request" of several satisfied users of the smaller Crossley cars.

THE fares on the motor omnibuses running from London to Brighton and back daily have been reduced, for the inside seats, to less than the ordinary third class railway fare. Up to the present the daily runs have proved very successful.

LONDON TO SALISBURY ON THE "DIRECT" DRIVE.

ALTHOUGH less than a year has elapsed since the Rolls-Royce cars were introduced to the public, first at the Paris Salon and then at Olympia, yet these British-built vehicles have already achieved wide and enviable reputation. Few manufacturers have attempted to build a six-cylinder model during the first year of their connection with the industry, and the successful issue of Messrs. Royce's enterprise in this direction offers as convincing a proof as could be desired of the expert and thorough manner in which they have attacked the problems of automobile construction, and at the same time it affords an opportunity for congratulating Messrs. C. S. Rolls on their astuteness in securing for themselves the sole agency of these desirable vehicles.

Quite recently we have had an opportunity of observing the practical behaviour of their latest six-cylinder model on the road, and we have, in consequence, no hesitation in saying that it ranks in the very highest class of automobiles on account of its general excellence. With four up we journeyed from London to Salisbury, *via* Winchester, entirely on the top speed, and on more than one occasion there were hills so steep that they caused the car speed to be reduced to ten miles per hour, and yet it was found unnecessary to change off the top gear, for the engine finding itself, even at that slow speed, capable of the work it had to do, continued to pull steadily and with perfect evenness to the top of the hill. To drive at ten miles an hour on the level is considered as evidence of sufficient flexibility on most fast cars, but there are very few in which the engines are capable of running evenly at this slow speed while heavily loaded. To attempt the task in many cases results in the immediate production of symptoms of distress which are sufficiently

pronounced to be a source of annoyance to the passengers, but on this car the up-hill work was by far the most delightful part of an extremely pleasant run over roads which in the days of old would have caused such a journey to be characterised by a series of down-hill rushes and up-hill grinds.

It is very generally recognised at the present day that although 4-cylinder engines give the average motorist all he can reasonably desire the *automobile de luxe par excellence* has an engine, the cylinders of which number six, and there is no doubt that the extra pair of cylinders were largely responsible for the sustained pull necessary to enable the car to surmount such steep hills on so high a gear—for the engine was of quite normal size—but we have observed in our recent tests that noticeable efficiency under such conditions is a marked characteristic of high-class productions.

Mr. Claude Johnson on the six-cylinder Rolls-Royce Car, which he recently drove from London to Salisbury, *via* Winchester, entirely on the top gear. During four consecutive days the car covered in all nearly seven hundred miles without receiving the least attention to its mechanism, and after this trip it was taken over to the Isle of Man, where it figured as one of the "official" cars during the Tourist Trophy Race.

THE current number of *Pearson's Magazine*, which is entitled the "Sports Number," contains a collection of short articles on all our most prominent and popular sports. Needless to say, that amongst these there is one on motor boat racing, from the indefatigable pen of Mr. S. F. Edge, who, amongst his multifarious employments, always seems able to find time to write something on the motor car question. From Mr. Edge's remarks, which are a good example of his trenchant style, we would quote the following:—

One reason is that motor car racing calls not only for athletic ability, but also for highly technical knowledge. Thus it gives one two difficulties to triumph over.

First, it is necessary to become physically fit, so that one may be able to stand the strain of driving for eight or ten hours, with the senses during the whole time tuned to the highest pitch of concentration, in order that one may take every curve at the maximum speed, with the most perfect accuracy, and with the minimum strain on tyres and car.

Then a high technical knowledge is essential, since every mile of the road must be taken in a different way. Mere speed never

won a race. You must remember that the instrument beneath you is more sensitive than the finest racehorse. It will respond to the accelerator so nobly that it will absolutely tear itself to pieces in its efforts to do all its driver urges it to do.

The preparations for a race are full of fascination. The road must be learnt absolutely by heart. One must know exactly the utmost speed at which one may go on every straight bit, while every curve must be judged so that the best speed may be compassed with the minimum application of the brakes.

Another article in the same magazine is devoted to the comparison of English and Americans in various sports, from which we also cull the following suggestive observations:—

Motoring in the United States is, if anything, more popular and widely indulged in than it is in England. Here, as in other matters, the American always wants to go very fast, and even in his parks he is as often as not (as becomes a self-respecting motorist) to be found exceeding the speed limit to a very grave extent. For quite a long time it was a recognised form of amusement to get caught and haled before the Bench for this offence. The mounted park-policemen made quite a good thing, it is said, out of the tips received by them for arresting the fair motorists who were defying the law.

RACES, RECORDS, AND TRIALS.

Tourist Trophy Race.—The petrol allowance for each car for the full course was $9\frac{1}{4}$ gallons, equal to $22\frac{1}{2}$ miles per gallon.

Graphic Challenge Trophy.—Altogether for this Trophy, competed for on Friday of this week in the Isle of Man, and particulars of which we gave last week, there were 12 entries. These were, in their official order for starting, as follows:—

No.	Entrant and Car.	Driver.
1	Humber, Ltd., 16-20-h.p. Humber ...	T. C. Pullinger
2	Chas. Sangster, 30-h.p. Ariel Simplex...	J. D. Spencer
3	Chas. Sangster, 40-h.p. Ariel Simplex...	Chas. Sangster
4	E. W. Lewis, 16-20-h.p. Rover ...	E. W. Lewis
5	Capt. Deasy, 30-40-h.p. Martini ...	Max de Martini
6	Capt. Deasy, 30-40-h.p. Martini ...	Capt. Deasy
7	Capt. Bennett, 14-17-h.p. Dixi... ..	Capt. W. H. Bennett
8	A. D. Grigg, 28-36-h.p. Daimler ...	A. D. Grigg
9	F. R. Simms, 20-24-h.p. Simms-Welbeck	R. Lascelles
10	A. Farnell, 30-40-h.p. Daimler... ..	A. Farnell
11	Capt. Bennett, 14-17-h.p. Dixi... ..	J. Beirreis
12	Guy V. Baxendale, 24-h.p. Thornycroft	Guy V. Baxendale

A 100 Miles Speed Judging Contest.—In regard to the report of this meeting of the Hull A.C. in our issue of September 2nd, the results published were, it appears, not issued officially. The actual winner, we learn, was Mr. G. H. Strong, on a 12-h.p. Brush car, he being, with 6h. 4m., closest to the scheduled time of 6h. 3m. 32s. (17 miles per hour). Mr. Arthur Atkinson, on a 15-h.p. Rose car, was second in 6h. 4m. 51s.—two remarkable performances. In Class 2 for Motor Cycles, the first 3 were (1) Mr. T. T. Philipson; (2) Mr. G. Parker; (3) Mr. H. Whiteley.

An impromptu hill climb for cars will take place subsequent to the motor cycle hill climb of the Sheffield A.C. to-day (Saturday). This climb will be confined entirely to non-trade members of the club.

Brescia Automobile Week.—This meeting started on September 2nd with an exhibition of cars, and finished on September 10th, when the real attraction of the whole week—the Brescia Circuit Race, and the contest for the Florio Trophy—took place. Mild excitement was furnished on the 3rd instant by the finish at Brescia of the motor bicycle race which had been run over a distance of 1,000 kiloms., starting from Milan, and in which the following makes were winners: (1) Stucchi, (2) Neckarsulm, (3) Adler. The Industrial Vehicle contest was run off on the 4th, 5th, and 6th, the next two days being devoted to motor boat racing on the Lake Garda. Main interest was concentrated in the Brescia Circuit Race on the final day, and when it was known an Italian car with an Italian driver was the winner, enthusiasm of a very demonstrative character naturally ensued. The length of the circuit is 167.1 kiloms., which was covered three times, making a total distance of 501.3 kiloms. Although originally it was intended to run the race without any neutralisation or slowing down from start to finish, it was later deemed necessary to specify three points where competing cars were re-separated by a time limit, in similar manner to the cars in the Gordon-Bennett Race on the Auvergne Circuit. These were at Brescia, Cremona, and Grazier. The course was

thoroughly well kept by 2,500 soldiers, whilst about 400 police and carabinieri, 600 cyclists, and 120 trumpeters were also employed in helping to regulate the traffic and deal with the general conduct of the course. 21 cars actually started, the first, Hémery, on a Darracq, being sent off at 6.30, the final one to start being Terry, on a Mercedes, at 7.52. Of these 11 ultimately officially finished, Raggio, on an Itala car, being declared the winner in 4h. 46m. 47 $\frac{1}{2}$ s.; Duray, on a De Dietrich, being about 10 mins. after him; Lancia, on a Fiat, following about an equal time behind Duray. The result should be a matter for considerable congratulation to the Italian manufacturers, who have thus followed up their fine running on the Auvergne Circuit by demonstrating their splendid staying and speed powers in this instance. Through unfortunate mishaps some promising cars were eliminated in the earlier rounds, the respective disappearances being as follows:—

First Round.—Le Blon (Isotta Fraschini), Cagno (Fiat), Gasteaux (Mercedes), Cortese (Mercedes).

Second.—Weilschott (Fiat), Gandini (Fiat).

Third.—Ceirano (Itala), Marieaux (Mercedes), A. Clement (Bayard-Clement), and Carles (Bayard-Clement).

The official results with times were as follows, the respective neutralised periods under the "time re-spacing" arrangements at the three points already mentioned, being also given:—

		h.	m.	s.	Neutral'd.	m.	s.
1.	Raggio (Itala) ...	4	46	47 $\frac{1}{2}$...	35	0
2.	Duray (De Dietrich) ...	4	56	20 $\frac{1}{2}$...	16	0
3.	Lancia (Fiat) ...	4	57	4 $\frac{1}{2}$...	9	44
4.	Hémery (Darracq) ...	4	58	12	...	6	0
5.	Rougier (De Dietrich) ...	5	12	50 $\frac{1}{2}$...	5	0
6.	Nazzaro (Fiat) ...	5	12	52	...	36	0
7.	Fabry (Itala) ...	5	18	10 $\frac{1}{2}$...	32	0
8.	Wagner (Darracq) ...	5	19	2 $\frac{1}{2}$...	25	0
9.	Florio (Mercedes) ...	5	29	11 $\frac{1}{2}$...	11	0
10.	Gabriel (De Dietrich) ...	5	33	44 $\frac{1}{2}$...	16	0
11.	Terry (Mercedes) ...	6	21	45	...	—	—

Raggio thus secures the Florio Cup, Ceirano, also with an Itala car, who was running splendidly until the last lap, obtaining the cup offered for the best time over the first 300 kiloms., the Itala house likewise securing the Salemi Cup for the best team of three cars in the race. The Michelin Tyre Company have also reason for congratulation in the fact that the first ten cars were all shod with their product. Last year, when Lancia on a Fiat car secured the Florio Trophy over a circuit of 370 kiloms. in 3h. 12m. 56s., Raggio was driving a light Itala car, he finishing second in his class in 4h. 17m. 6 $\frac{1}{2}$ s.

Royan Meeting.—A pleasant week resulted from the Royan automobile fixture, which commenced on September 2nd with a Fuel Consumption Trial from Bordeaux to Royan, in which eleven of the competitors were officially timed. The results of this were:—

Car and Passengers.	Time.	Fuel.	Points.
	h. m.	litres.	
1 10-h.p. De Dion (5) ...	3 9	9	136
2 24-h.p. Mors (7) ...	2 40	21	172.8
3 10-h.p. Renault (4) ...	3 21	12	241.2
4 60-h.p. Berliet (4) ...	2 30	24	360
5 12-h.p. Corre (4)... ..	3 33	19	404.7
6 24-h.p. Berliet (4) ...	2 30	24	404.8
7 24-h.p. Berliet (4) ...	3 0	25	405
8 10-h.p. Gard.-Serp. (5)...	3 39	42	459

On Monday and Tuesday, on the front at Royan, speed

tests were held over 1,609 metres with a standing start. The results were:—

Motor Bicycles.—1, Cissac, 12-h.p. Peugeot, 57s.

Cat. 2. Cars 600 kilogs.—1, 12-h.p. Delahaye, 1m. 19s.

Cat. 3. Cars under 12-h.p.—1, 10-h.p. Aster, 1m. 33s.

Cat. 4. 15 to 30-h.p.—1, 24-28-h.p. Mercedes, 1m. 54s.

Cat. 5. Closed vehicles from 15 to 30-h.p., was gained by a 34-h.p. Mors.

Cat. 6. Racing Cars under 1,000 kilogs. and over 30-h.p.—1, 60-70-h.p. Panhard, 1m. 20½s.

The last day of the meeting was devoted to a motor car and balloon chase, and the distribution of the prizes.

MOTOR CYCLING.

Irish Motor Cycle Union.—The annual contest between teams representing the Dublin and Belfast Centres of the Irish Motor Cycle Union of Ireland took place on Saturday last, starting from Balmoral, Belfast, and finished at Tolka Bridge, Drumcondra, Dublin. The contest was for the cup presented to the Ulster Centre of the Union by the president of that body, the Hon. Leopold Canning, D.L. Belfast won the event in 1903, Dublin the following year, while in the early portion of the present season, the event held in June was, after consideration by the committee, declared void, owing to an error in the route card, and the arrival of several competitors at the finish before the scheduled time. The event was re-run on Saturday, when the following teams started from Balmoral, Belfast, at 1.30 p.m.:—

Ulster Centre.—A. W. Hamilton, F. Hulbert, J. Stewart, J. Newhall, J. Holden, J. McAllen, C. Montgomery, T. Ireland, H. G. Ferguson, P. S. Brady.

Dublin Centre.—C. B. Franklin, T. W. Murphy, G. Magus, H. Mooney, W. H. Meredith, S. Black, R. W. Howison, J. A. Armstrong, J. Mooney, R. E. Price, W. Jacques, J. G. Link, C. G. H. Lewis, J. D. Redmond, G. "James." The roads, owing to the recent inclement weather, were bad in the early stage of the journey, side-slips and punctures reduced the number of competitors before Dundalk was reached, and of those remaining in to the finish fifteen arrived at the timing line, Tolka Bridge, Drumcondra, Dublin, between the hours of 6.19 and 7.55 p.m. Result:—

DUBLIN.

J. A. Armstrong (3½-h.p. Swallow) ...	100 marks.
H. Mooney (2½-h.p. F.N.) ...	100 "
J. Mooney (2½-h.p. F.N.) ...	100 "
R. W. Howison (2½-h.p. F.N.) ...	100 "
Total	400 "

BELFAST.

J. Stewart (2½-h.p. Triumph) ...	100 marks.
F. Hulbert (3-h.p. Triumph) ...	100 "
J. Holden (3-h.p. Rover) ...	100 "
P. S. Brady (3½-h.p. Bat) ...	90 "
Total	390 "

A MOTOR cycle hill-climbing competition is being held to-day (Saturday) under the auspices of the Sheffield A.C., when the following members are qualified to compete:—Messrs. F. Donovan (2½-h.p. De Dion), G. D. Fletcher (3½-h.p. White and Poppe), W. L. Gilder (2½-h.p. Royal Enfield), F. W. Oates (2½-h.p. De Dion), J. Walker (5-h.p. Devonshire).

AN open hill-climbing competition for motor cycles will be held on Maple Hill, near Boxwood, by the Hertfordshire A.C. on the 23rd instant. The competition will be conducted under Auto-Cycle Club rules, and will be a handicap based on a formula provided by the A.C.C. There will be four classes, viz.:—1. For machines having a cylinder capacity equivalent to 76 × 76mm.; 2. Cylinder capacity up to 85 × 85mm.; 3. Unlimited cylinder capacity; 4. Passenger vehicles. The entrance fee for non-members will be 7s. 6d. Entries will close on Tuesday, the 19th inst., and should be addressed to the hon. sec. at 7, Whippendell Road, Watford.

MOTOR cycles in France continue to increase in popularity. According to statistics just published by *Les Sports*, the number of motor bicycles on January 1st of the present year was 27,435, against 19,816 on the 1st January, 1904.

The Hallé Spring Wheel.—The long distance trial of these wheels, on the Wolseley car, is, we learn, proceeding satisfactorily, 2,850 miles having been completed up to the 9th inst. without any wheel trouble.

THE Automobile Association of Bengal have arranged to hold reliability trials in India from January 26th to 30th next. The vehicles will be divided into three classes, according to price. There will be five runs over a total distance of 583 miles, as follows: January 26th, Calcutta-Asansole, 133 miles; 27th, to Ranchi, 134 miles; 28th, to Hazaribagh, 45 miles; 29th, to Asansole, 138 miles; 30th, back to Calcutta, 133 miles. On the third day a hill-climbing test will be included.

French Trials for Tricars.—Under the auspices of our French contemporary, *L'Auto*, who organised the event, twenty-one tricars set out on Sunday last to cover a distance of 100 kiloms. over the road between Saint-Germain and Mantes, which places lie 33 kiloms. apart. Three journeys were consequently made, the start being from Saint-Germain and the finish at Mantes. During the return run from Mantes, a timed climb took place over a kilom. up Flins Hill, at the bottom of which each tricar made a standing start. On the last outward run to Mantes the machines were timed over a flying kilom. a few miles from the finish. Of the twenty-one starters eighteen finished the entire journey within the limit time of five hours, no competitor being allowed to drive at a greater speed than 30 kiloms. per hour, except while being timed over the two kilom. stretches.

The winning machine was Bozier III. (Michelin tyres), driven by Schweitzer, and a tricar of similar make came in second. The third and fifth places were secured by Contal tricars—a make of machine which has, since the Auto-Cycle Club's Reliability Trials, become known in this country. The Moto-tri Contal machines are primarily constructed for commercial use as light delivery vans, and in this direction they are deserving of close attention from those to whom such a compact form of machine would be suitable. M. Contal, who states boldly that 100 kiloms. is useless for testing the machines, has offered to run against any of the competitors over 1,200 kiloms. without a stop. The following are the times over the kilom. for the six fastest competitors:—

Place.	Machine and Driver.	Weight.		Time for 1 kilom. on		
		Empty.	Loaded.	Hill.	Level.	Total.
		Kilogs.		m. s.	m. s.	m. s.
1	Bozier III. (Schweitzer)	170	320	2 23	1 22½	3 45½
2	Bozier I. (Giraud)	170	310	2 43	1 21½	4 4½
3	Contal II. (Rivière)	170	320	2 38½	1 28½	4 6½
4	Austral III. (Cheilus)	170	310	2 46½	1 21½	4 8½
5	Contal III. (Pillas)	180	330	2 59½	1 28	4 27½
6	Bruneau I. (Foulon)	90	240	3 6½	1 27½	4 34½

New Records.—New motor bicycle records were established for machines with one-third litre cylinder capacity, on Sunday last, by Cissac on a Peugeot machine at the Paris Parc des Princes Track, his time for the 100 kilometres being 1h. 10m. 35½s., beating Collomb's previous record time for the same distance by nearly 2 min., and further beating Collomb's distance in the hour by over 2 kilometres, with 84.7 kilometres. A remarkable feature of the run was the evenness of Cissac's last laps. For the 10 kilometres, from 70 to 80 and 80 to 90, the times were identical, and the last 10 kilometres of the 100 were timed for 6m. 59½s., the best 10 kilometres being done in 6m. 52½s. Cissac commenced to make his records from the 20th kilometre. The chief new records put up were:—

	Old.	Cissac's.		Old.	Cissac's.
	m. s.	m. s.		m. s.	m. s.
30 kil.	21 10	20 56½	70 kil. ...	50 26½	49 41½
40 kil.	28 32½	27 57	80 kil. ...	57 58½	56 38½
50 kil.	36 2½	35 5½	90 kil. ...	1 5 27½	1 3 35½
60 kil.	43 19	42 41½	100 kil. ...	1 12 20½	1 10 35½

MOTOR BOATING.

British International Cup.—When we stated last week that the British boats would be left to "walk over" the course in order to bring back Sir Alfred Harmsworth's Cup to Great Britain, as even Palaisoto had retired from the contest on behalf of France, the information was strictly correct. But the sporting instinct inherent in the committee of the French Club, which has charge of this section of automobilism, induced them to prevent the race from losing its international character, and they arranged, with the consent of the British competitors, to give the visitors to Arcachon a run for their money by nominating Loodit III, engined by Theverin and Seguin with an 118-h.p. motor, and M. Thubron's Mab, a well-known British-owned motor craft in Continental waters, fitted with an 80-h.p. Richard-Brasier motor, to take up the running. Although only Mab ultimately started on behalf of France, the semblance of a contest against the British greyhounds of the sea was created, and an attractive event rewarded those who had come to see what fast motor boating really was.

The start for the race was made at 2.30. the two Napier boats getting away in splendid style, and gaining, from the first, rapidly on the other competitors. A strong wind was blowing, and provided a beautiful sight by the clouds of spray which at times quite enveloped the racers. Towards the finish of the first lap, Napier II. broke a terminal, and was running for about half a mile with one engine only firing, Lord Howard de Walden's Napier, steered by Mr. Seaton Edge, during this ease off, getting ahead. Not for long, however, for the mishap once put right, Napier II. rapidly overhauled her, and steadily distanced the other boats right up till the finish. Brooke unfortunately got into difficulties during the first round, although her start was good, and was ultimately towed home. Mab managed to keep going without trouble until the third round, when for a time she broke down, eventually, however, crossing the finishing line. The time for Napier II., which secured the Cup for Great Britain, was 1h. 32m. 26s. for the full course of 30 marine miles. This splendid racer is the joint property of Mr. Lionel de Rothschild and the Hon. John Scott Montagu, the latter, upon this occasion, steering the boat to victory. Napier's time was 1h 33m. 33s. The times for the respective laps of the Napier craft were as follows:—

		Napier II.			Napier.	
		m.	s.		m.	s.
First round	23	55	...	23	5
Second round	21	21	...	22	48
Third round...	...	22	14	...	23	17
Fourth round	...	24	56	...	24	23

Sir Alfred Harmsworth, who witnessed the race, was so impressed with the advantages of the Arcachon Bay for racing purposes that he has offered to give a special Cup for a competition in these waters.

The Deutsch Cup.—On Tuesday, Napier II. followed up her success and secured this trophy, offered by M. Deutsch de la Meurthe. The course was the same as for the Harmsworth Cup. Results:—

Cat. 1.—Boats over 8 metres: (1) Napier II., 1h. 27m. 36s.; (2) Napier, 1h. 52m. 34s. Napier in the last lap lost 20 minutes through a stop. Brooke I. abandoned the race early after the start, and is now returning to England.

Cat. 2.—Boats under 8 metres: (1) Herald, 2h. 40m. 5s.; (2) Lanturlu, 3h. 23m. 45s.

For the "Prix d'Honneur," Napier II. had a "walkover" the two laps, equal to 15 miles. Her time was 41 m. 3 s., this giving a better speed than any accomplished during the whole two days racing.

Coupe Récopè.—On Saturday last, in Arcachon Bay, the competition for the Récopè Cup took place. This, it will be remembered, is given for craft using alcohol as fuel, and although three boats were entered for the contest, viz., Cazemoto, Mab, and Herald, only Cazemoto actually started. The distance was 75 miles. This Cazemoto accomplished with remarkable regularity, especially in the earlier laps, the full distance being covered in 8h. 25m. 25s. The course was 7½ miles, and therefore had to be covered ten times, the best lap time being the fifth, in 47m. 55s., each of the first four laps having been accomplished in about 48m. 50s. The 7th, 8th, 9th, and 10th rounds occupied respectively 49m. 16s., 52m. 46s., 59m. 23s., and 53m. 1s. Last year the Cup was secured by Monsieur J. Cazes with his boat, Marthe, over the Calais to Dover course.

Lake Garda Motor Boat Races.—The two days' motor boat racing on Lake Garda, which took place during the Brescia Automobile Week, resulted in some good sport. On the first day, September 7th, in the morning the cruisers were sent off over a course measuring 65 kiloms., and during the afternoon the racers took their turn over 105 kiloms. Good weather prevailed, and the chief results on this day were:—

CRUISERS. *Series 1: Under 6½ metres.*—1, Mendelssohn (Mutel motor), 2h. 38m. 29s.; 2, Delahaye V., 2h. 47m. 27s.

Series 2: 6½ to 8 metres.—1, Excelsior VII. (Picker-Moccand motor), 2h. 34m. 51s.; 2, C.P.N. (Thornycroft motor), 2h. 54m. 8s.

Series 3: 8 to 12 metres.—1, Delahaye VI., 1h. 58m. 55s.; 2, Fiat X., 2h. 2m. 50s.

RACERS.—1, Antionette III. (Levasseur motor), 2h. 36m. 46s.; 2, New Tréfle (Richard-Brasier motor), 2h. 41m. 47s.

On the second day, September 8th, the whole of the craft, including racers, cruisers, and "extra reglementaire" boats, were despatched over a course of 152 kiloms. On this day Antoinette III. upheld her fine reputation by covering the distance at a speed of nearly 50 kiloms. per hour, her time being for the distance 3h. 2m. 42s.—a world's record. In the cruisers the results were: (1) Delahaye VI., 4h. 25m. 50s.; (2) Fiat X., 4h. 42m. 59s.; (3) Excelsior VII., 5h. 41m. 59s.; (4) Mendelssohn, 6h. 11m. 49s.

THAMES CONSERVANCY REGULATIONS FOR MOTOR BOATS ON THE THAMES.

THE Thames Conservators, who, as our readers are aware, have for some time past been tentatively dealing with the question of regulating motor boat traffic on the Thames, have now issued the following regulations, by which the traffic in future will be controlled. These have still to receive the confirmation of the Local Government Board, but this no doubt will be purely a formal matter.

Carburettors so fitted as in the event of an overflow to drain into a gauze-covered receptacle capable of being emptied from time to time as may be necessary, and of a form to be approved by the Conservators.

Fuel tanks constructed of copper or an alloy of copper riveted, or of steel efficiently galvanized after making up, and their freedom from leakage or liability to leakage ascertained by testing.

A closed locker provided for the stowage of cans containing petrol carried in excess of that contained in the fuel tanks.

Fuel tanks installed in such a position that ready access can be had to all connections.

All fuel pipes of seamless drawn copper or other tubing approved by the Conservators.

Fuel pipes fitted with ground cone union joints or other approved form of joint, and not with flange or socket joints. The main fuel pipe provided with two "concertina" bends or coils, one close to the fuel tank and the other close to the carburettor.

Fuel pipes carried where they are least liable to become damaged, and in all cases so fitted that ready access can be had to them, and all connections throughout their entire length.

One cock fitted to the fuel feed-pipe where it leaves the tank and another where it joins the carburettor.

The exhaust-pipe water-cooled unless taken into a funnel. Where the exhaust-pipe is taken into a funnel provision made to prevent liability of ignition of inflammable vapour in any part of the boat.

The silencer effective as regards suppression of noise of exhaust to the satisfaction of the Conservators and constructed of sufficient strength to prevent it being injured by the occurrence of an explosion therein.

A spirit-tight tray or receptacle, the sides of which are carried up as high as the propeller-shaft will permit of, fitted beneath the engine so as to prevent leakage of spirit and lubricating oil escaping into any other part of the boat.

The ignition circuit throughout carefully insulated. High tension leads from coil to sparking-plugs carried through a water-tight tube or so installed as to prevent leakage of current or risk of breakage or damage by water. Electric leads rigidly fixed.

If a spark gap be employed, it must be so enclosed as not to be capable of igniting inflammable vapour.

Some form of sparking-plug employed in which external sparking is as far as possible guarded against.

If trembler coils are employed, the same must be placed in a position where an accumulation of inflammable vapour is not likely to occur.

No form of hot tube ignition employed.

The master of every petrol motor launch, whilst waiting to enter or when in any lock on the Thames, shall give to any officer of the Conservators such facilities as he may demand to inspect such petrol motor launch with a view to ascertaining whether the aforesaid requirements are complied with.

Whilst waiting to enter, or when in any lock on the Thames, the master of any petrol motor launch, and the person or persons on board the same, shall comply with the following regulations:—

Having entered a lock the cock on the fuel feed pipe shall immediately be closed, and shall not be re-opened until the lock gates are opened for the egress of the vessel or vessels then in the lock.

In any lock the engine shall be stopped before the lock gates are closed, and shall not be restarted until the gates are opened for the egress of the vessel or vessels then in the lock.

No fuel tank or petrol can shall be opened or manipulated on any petrol motor launch.

Any petrol carried in excess of that contained in the fuel tanks shall be carried only in two-gallon cans, of a pattern approved by the Railway Clearing House for conveyance of petrol by the railway companies. Such cans, whether full or empty, shall be stowed in a closed locker, which must not be used for any other purpose while any petrol can is therein.

No person shall strike a match whilst on any petrol motor launch.

With a view to prevention of fire a proportionate quantity of sand equal to one-half a cubic foot for every complete 12 ft. in length of the hull of the petrol motor launch, together with a shovel or scoop, shall be carried in some readily accessible place.

Any person acting in contravention of any of these bye-laws shall for every such act be liable to a penalty not exceeding £10, and in the case of a continuing offence to a further daily penalty not exceeding the like amount, which said penalties shall be recoverable, enforced, and applied according to the provisions of the Thames Conservancy Act, 1894.

✱ ✱ ✱ ✱ AERONAUTICS.

MR. BALDWIN, whose death whilst ballooning in America we recorded last week, must not be confused with "Professor" Baldwin, who has been so long known as a parachutist in Great Britain.

THE navigable balloon, Toledo No. 2, with which Mr. Knabenshue has been entertaining the people of New York, is a departure from the design of the vessel, Baldwin's "California Arrow," which he so successfully navigated at the World's Fair. Toledo No. 2 is in general shape and size exceedingly like M. Santos Dumont's little No. 9, with which he used to gallivant

about the Paris streets and parks, excepting that it has the propeller (which is consequently really a tractor), arranged at the front of the framework instead of the rear. The total amount of gas required for inflating Toledo No. 2, is 7,000 cubic feet. Mr. Knabenshue is of opinion that this shape presents advantages in two respects. It diminishes the tendency of the gases to shift and accumulate at one end (though, perhaps, some difference of opinion may prevail on this point), and it also diminishes the resistance to movement through the atmosphere.

¹ London, 12.35. ² Brighton, 2.10 p.m. ———— Sea ———— ³ France, 8 p.m.
During his cross-channel trip to view the eclipse, which we chronicled last week, Mr. Frank H. Butler took barometric readings with a recording barometer during the whole of the trip, and the chart of these we have, by his courtesy, been able to reproduce above. The wavy line shows the barometer readings, while the alternate columns of figures give the height in metres and the barometric pressure in millimetres of mercury. It will be seen that the variations in height during the trip were very considerable, the highest altitude having been, as may be observed, just above 3,000 metres, or approximately 10,000 feet.

AN account of an airship race *pour rire* is reported from Los Angeles between Mr. Wordin Twombly's airship, "The Bullet," and a contraption of Mr. Elver Renold, entitled "The Man Angel No. 2." The race was to take place over 30 miles, after accomplishing which, the airships were to come back again to the starting point. None of them, however, succeeded in returning, but we are informed that the "Man Angel," which is propelled by oars and rose to a height of 3,000 feet, *would have won had she returned*. "When the sky falls," as the old proverb says, "we shall catch larks."

THE "BETTORUS" NON-SKID.

There are now an almost innumerable number of non-skid devices on the market, but that type

which seems to have received the greatest support from the motoring public is undoubtedly the leather tread variety, of which there are now quite a number of first-class manufacturers. In many cases, these bands embody some special feature which has been devised as an improvement by the respective makers, and in the "Bettorus" non-skid band—which is the most recent to come before our notice—the peculiarity lies in the construction of the rivets used for studding the tread. These, instead of being formed in one piece, are made in two parts, the object of this being that it enables the separate washer forming the head to be case-hardened to resist wear, while the bifurcated rivet itself is left soft so that it may be better suited for riveting. In other respects, the band, which is constructed of pliable chrome leather, is similar to those which we have already described; the sides of the band are carried right over the beaded edges of the tyre.

Royal Commission on Motor Cars.

The first sitting has been provisionally arranged to be held on Monday, October 16th. The offices of the Commission are at 68, Victoria Street, S.W.

"Legalimit" Car.—A new car is shortly to be placed on the market by Messrs. C. S. Rolls and Co., which will be distinguished by the title, "Legalimit" Car, it having been "specially designed to maintain a constant speed of twenty miles an hour everywhere—uphill, downhill, and on the level—without changing gear." An order for one of these cars has, we learn, already been placed by Sir Alfred Harmsworth, Bart., who has given instructions to have the chassis fitted with a special form of body designed to his own specification. This completed car will be a feature of Messrs. C. S. Rolls and Co.'s stand at the next Olympia Show.

CLUBS AND ASSOCIATIONS.

Aero Club.—The programme for the Autumn season includes September 23rd and 30th meet at the Crystal Palace, October 7th at Reading, 14th at Salisbury, 28th at Oxford. The balloon ascents at the first two meetings will be at 2.30 p.m., and at the October meetings at 12.30 p.m.

Ashby de la Zouch Inter-Club Meet.—An inter-club meet is taking place to-day, Saturday, at Ashby de la Zouch, in which the Nottinghamshire, Derbyshire, Lincolnshire, Leicestershire, Manchester, Wolverhampton, and Sheffield Automobile Clubs are taking part.

Scottish A.C.—At a meeting of general council held in Glasgow last week, it was agreed that the club should take steps to look after the interests of manufacturers and users of commercial and heavy vehicles, and that a special committee or section should be formed for this purpose. A committee was appointed to consider the best means to carry this into effect.

Lengthy consideration was given to the subject of the Royal Commission, and to the arrangements necessary for obtaining information and data for submission to the same, and a representative committee was appointed to deal with the matter, and to act in conjunction with the Joint Committee of the Automobile Club and the Motor Union.

The Society of Motor Manufacturers and Traders.—In addition to the munificent sum of £500 contributed by the society to the legislative fund of the Joint Committee of the Automobile Club and the Motor Union, appointed to prepare evidence for the purposes of the Royal Commission on the Motor Car Acts, the society is bearing without outside assistance the whole of the very considerable expense in obtaining trade statistics which will be used in evidence to be given by the society itself before the Commission. Already returns have been made by some of the leading manufacturers, who have at the same time applied to the society for forms for all their agents, showing the importance they attach to the matter. The names of all the firms making returns will be published from time to time.

ON Thursday, August 31st, at the Hotel Cecil, the second ballot for space at the Olympia Show took place, and practically all the space in all the sections was dealt with.

Designs for interchangeable bodies are daily becoming more ingenious. In the above photograph a recent instance of this character is seen in the 22-28-h.p. Crossley Car which has just been built for Mr. Walpole Greenwell, of Woldingham, Surrey. The whole of the top, it will be noticed, is detachable in one piece, and in order to make a satisfactory job in this form, a fresh fitting is supplied to the car to form the back of the front seats in place of those which are removed with the super-structure. This carriage work has been executed by Mr. Mulliner, of Northampton.

Tramillogical.—The motor 'bus has produced its effect on literature of a kind if it has done nothing else, for since its appearance on our streets there has been a perfect cataract of articles more or less convincing, designed to demonstrate the many superior advantages of the electric tram. A lengthy communication of this kind appeared in a recent number of the *Engineering Review* (which, by the way, is illustrated by one of our own blocks), over the signature of Mr. H. M. Sayers. It will prove most satisfactory reading to everyone interested in the motor 'bus movement, for it is to all intents and purposes an appeal in *misericordiam*. It attempts to show that the natural spheres of the electric tram and the motor 'bus are so totally different that both of them may live like the two brothers, so pathetically described by Mrs. Hemans, who "grew in beauty side by side." For the tram, Mr. Sayers arrogates to towns, and wishes to persuade the motor 'bus (with the true pastoral spirit of Virgil in his Georgics) to relegate

in constructing it, whether with underground conduits or overhead trolley wires, with all the complicated system of feeders and connections required in a tram system? After this, that he should take no notice of the tendency of trams to congest traffic, and practically ignores the superior movability of the motor 'bus, is only what one would expect. If ever an institution were destined to win its way mainly by the short-sighted and illogical attitude of its opponents, it would surely be the motor 'bus movement.

Opening up the Turkish Empire.—The detestation entertained by the Turkish authorities, as indeed by nearly all Mohammedans, against the public employment of photography, is generally known, but people may not be so generally aware that the automobile is equally banned in the dominions of the Sultan. So that much praise must be accorded to the initiative and enterprise of Mr. R. L. Jefferson, F.R.G.S., who has arranged to travel *en automobile* to the Turkish capital. The authorities at first refused to grant the necessary permit,

We reported last week the fire which occurred at the premises of the Fiat Company, in Long Acre, when, as we pointed out, a more serious conflagration was avoided by the prompt use of the New Era Fire Extinguisher, which subdued the petrol flames most effectively. Our photographs above show (1) the Fiat premises shortly after the outbreak, and (2) the scene in Long Acre after the work of the Fire Brigade was finished.

itself to the country. In fact, Mr. Sayers desires to "rusticate" the motor 'bus. We fancy, however, the motor 'bus will refuse to be rusticated. Certainly if it is to be rusticated on the strength of the arguments brought forward by Mr. Sayers, a great injustice will be done to it. For the grounds on which he attempts to show that it cannot successfully compete with the tramcar will not hold water for a minute. Concerning the cost of fuel, Mr. Sayers, of course, makes it out to be in favour of the electric tram, but, even with the one-sided figures which he gives, he does not prove his case. The main cost of motor 'bus running he rightly attributes to tyre consumption, and he makes out a terrible indictment *re* expense of the motor 'bus from this point of view. Will it be believed, therefore, that while he compares iron tramwheels with rubber shod 'bus wheels, he makes absolutely no allowance for depreciation of the permanent way of tramcars, and no allowance for the enormous amount of capital sunk

but by the intercession of the British Ambassador to the Porte, Sir Nicholas O'Connor, an *irade* has been issued authorising Mr. Jefferson to pass the Turkish frontier, and instructing the officials *en route* to afford him every protection. Mr. Jefferson, who will be accompanied by a mechanic, starts next Wednesday from Coventry, and will cross Europe by way of Holland, North Germany, Austria-Hungary, Servia, and Bulgaria, and will reach Constantinople by way of Adrianople. The route will involve the "passage of the Balkans," where some difficulty will probably be experienced. The car selected by this adventurous traveller is a special two-seated 8-h.p. Rover. He has selected a one-cylinder car as being easiest to repair in case of breakdowns in the rough country which must necessarily be traversed. The body is so designed that the seats can be removed and the floor of the car used as a bed. We hope to be able to publish from time to time telegrams from Mr. Jefferson indicating the progress of his tour.

In our issues of April last, full details were given of the Wolseley petrol omnibuses, and amongst the illustrations then given were views of the chassis fitted with these makers' twin-cylinder engine. The above illustration shows a 4-cylinder chassis.

Digest of United States Patents.—All automobile engineers, patent agents, and people interested in the automobile movement will be glad to learn that Mr. J. T. Allen is about to issue a "Digest of United States Patents from 1789 to July, 1905," dealing with the subjects of *air, caloric, gas and oil engines*. The work will be uniform with the "Digest of U.S. Automobile Patents" already published by Mr. Allen, which has proved to be of so much value and usefulness to automobile and consulting engineers. The work, like its predecessor, will be divided into two portions, giving the drawings in the first half and corresponding abstracts of the specifications with claims in the second, and will be provided with copious indexes.

To Prevent Breaking the Law by Automobilists.—Part of the cyclist corps of the Automobile Association is being mobilised for active service on the Portsmouth Road between Kingston and Godalming. It is hoped to complete the arrangements by to-day, Saturday, after which day it is devoutly to be wished that the list of members of the Association will be augmented as surely and quickly as the number of "regrettable incidents" will decrease.

THE Directors of the Newbury Race Course, where the opening meeting will be held on the 26th and 27th instant, have made very unusual and complete provision for accommodating motor cars. A spacious garage has been erected and set apart entirely for automobiles. This will be under the charge of Messrs. Stradling and Plenty, Limited, of Newbury, who will be in a position to look after the cars during the racing, and will have an efficient staff of mechanics who will be equal to anything that may require attending to on the spot.

THE Isle of Wight Central Railway Company is suffering, according to the statements of Mr. T. D. Bolton, M.P., who presided at the half-yearly meeting, from motor car competition. Everything possible, he said, would, however, be done to combat the competition, and ended (as usual with chairmen under such circumstances) by stating that nothing need be feared. Perhaps the best method of combating the competition would be for the railway company to do practically the same thing, and itself run services of motor coaches over their existing line.

View, from above, of the Wolseley chassis for a 36-seated, double-deck omnibus. The 4-cylinder horizontal engine is clearly visible in this illustration.

Mr. Andrew Carnegie has selected for his use a 24-h.p. Wolseley Car, which has recently been delivered to him by the Wolseley Company, a photograph of which we now reproduce above. The body is of the Limousine type, the wheel base is 9 feet, and the tyres selected are Michelin with Shaw bands on rear wheels.

THE Chertsey Rural District Council recently commenced a campaign against the dust fiend to which we have so frequently referred. The expense is being equally divided between the Council and Mr. F. C. Stoop, of Byfleet, and the picturesque stretch of road, beautifully wooded on either side, stretching between Byfleet Corner and the western branch of the River Wey, has been selected for the experiments. A copious dressing with tar has been applied to the surface of the road, which was previously brushed smooth, and the tar applied in the hot condition by hand dippers from a portable heating apparatus similar to those employed for heating asphalt. The tar was then well brushed into the road surface, and the road scrapings, which had previously been brushed off, were strewed upon the top of the tarred surface. Since the operations were concluded the rain has removed this added layer of dirt, and the road now presents the appearance of a well asphalted surface, except that previous to the application it was somewhat out of repair and that there are in consequence a good many hollows, ruts and depressions which will certainly have the effect of preventing the tar treatment from wearing as long as it would do if applied to a newly made-up road. Time alone can show the value of the treatment, though it must be admitted that at present the condition of affairs looks promising, and the local ratepayers are quite sanguine that the treatment may ultimately prove not only pleasant but economical. The stretch of road in question, upwards of half a mile in length, has a nice easy slope eastwards, and is in consequence a stretch on which motor cars get up a good rate of speed, accompanied hitherto by very large clouds of dust. The present dustlessness, due to the tarring, is most satisfactory. The thanks of automobilists and all interested in the dust question are certainly due to both Mr. Stoop and the Council for their public-spirited initiative.

THERE was a rather funny case at Marylebone one day last week, in which Mr. A. F. Marston, a driver in the employment of the Grande Maison d'Automobiles (The Motor House) of Euston Road, was summoned for using a motor car on the public highway, the car not being registered in accordance with the Act. As a matter of fact, Mr. Marston was towing a finished chassis behind a finished motor car, the object being to see how the chassis ran before working it under its own power, and dealer's identification marks were affixed to the front of the towing car, and to the back of the towed chassis. Mr. Staplee Firth, who defended the case, stoutly maintained that the whole paraphernalia formed one vehicle, that the towed portion certainly was not a separate motor car, as it was not running under its own power, and that the towing was part of the process of testing the chassis after completion. Mr. Denman, the magistrate adjudicating in the case, appeared to be impressed by the arguments placed

before him, and finally dismissed the summons. An amusing feature of the case and illustrative of police methods, was provided by the fact that not only was Mr. Marston summoned, but also his employer, for that "he did unlawfully aid and abet, counsel and procure one Arthur Frederick Marston to commit an offence." Needless to say this absurd summons was also dismissed. When our police have time to get up such frivolous cases as these it is hardly to be wondered at that undetected crime is rampant in the Metropolis.

HIS MAJESTY THE KING is known to be a keen motorist, and the British-built Daimler car is his favourite. He has just ordered another car of this make, of 35-50-h.p., the same that achieved such great success at the Blackpool speed contest. This is the seventh car which the Daimler Company have constructed for the King. The body will be similar to the 28-36-h.p. which His Majesty at present uses, and it is hoped to have the car completed for the forthcoming Olympia Exhibition in November next.

The Right Hon. the Marquis of Salisbury, C.B., has just taken delivery of the 17-h.p. Hotchkiss Landaulette shown in our photograph, the carriage portion of this striking car being by Hooper.

THE Guildford magistrates netted the nice little sum of 100 guineas for the local rates by the fines imposed on motorists arraigned before them last Saturday in the Surrey county town.

CERTAINLY "General" Booth knows how to make full use of the automobile for bold advertisement. He has just concluded an evangelistic tour of 34,400 miles, and on his return to London, where he was welcomed at a great meeting at the Albert Hall, instead of making the usual prosaic entrance to the platform, he appeared thereon in the car in which he had made this record tour. Of this great effort, 2,250 miles were covered in England and Scotland in a period of five weeks and four days.

THE calibre of some of our magistrates is amusingly illustrated by a case which recently came before the Yarmouth Police Court, in which Mr. de Caux, a J.P., and apparently a member of the Yarmouth Bench, caused

Mr. Sidney Adams to be summoned for furiously driving a motor car. It was so dark at the time that Mr. de Caux could not locate the part of St. Peter's Road at which the alleged offence took place, but in spite of the darkness he was certain that the defendant was coming along at a most dangerous pace. Mr. de Caux is evidently one of those people who can always see a motor car going too fast, even when they cannot see much beyond their own noses. The case was dismissed.

WE referred recently to the case of a policeman who had become celebrated as a maker of violins. It appears from a daily paper that Croydon boasts a constable who is the inventor of a non-fouling ignition appliance for motor cycles. It is to be hoped that the irony of circumstances never compels this inventive "limb of the law" to lie in wait for motor cyclists in the Surrey hedges. Presumably motor cyclists will ascertain the style and title of his invention, and if falling victims to police traps in the neighbourhood of Croydon, may be relied upon to state that their bicycles are fitted with the same. If after that, they are compelled to appear in police courts, it will certainly be evidence that *esprit de corps* is sadly lacking in the force.

AN example of what the modern automobile can accomplish when put to it, was provided by a sensational incident which is reported from Paris. Two ladies (Mrs. J. R. M. Dillon and her mother) missed the boat train to Cherbourg at the St. Lazare Station. Someone suggested that they should apply to M. Charley, of the Mercedes depot, to provide them with a machine to take them by road, and after some hesitation M. Charley consented. The 350 kiloms. (217 miles) to Cherbourg was covered by the 40-h.p. Mercedes in just over 5½ hours, the time accomplished by the Cherbourg express being 8 hours, and the ladies were in time to board the Atlantic liner which was still in the roadstead.

MOTOR HARVESTING BY NIGHT.—A remarkable scene was witnessed near the Great North Road recently, when a demonstration with the Ivel Agricultural Motor was given on Mrs. Kendall's farm near Biggleswade. The object was to demonstrate that an agricultural motor can be used by night as well as by day. The motor and mowing machine were fitted with "Castle" acetylene lamps, and it was clearly shown that by this means harvesting could be continued throughout the night as easily and satisfactorily as during the day. Our photograph shows the operation in progress, when the Ivel motor hauled two 6-foot mowing machines, and in 3 hrs. 35 mins. cut 15 acres.

WE hope the police evidence in the prosecution which recently came up for hearing at the Haywards Heath Police Court against the London and Brighton Motor Omnibus Company was mistaken in the speed. It was alleged that the motor 'bus executed a sprint (of course through a police trap) of 32 miles an hour. The vehicles are not geared for any such speed as this, and if such a speed was really established by more reliable methods than the police usually adopt, the vehicle must have been running down a long incline. In any case, however, it must be admitted that such high speeds for vehicles of the weight of a motor 'bus are to be thoroughly deprecated.

IN the article in the *Badminton Magazine*, to which we referred last week, Major C. G. Matson wrote: "All I can say is that no prospective legislator sees me burn any petrol on his behalf unless he is sound on the motor car question." We hope that every automobilist will adopt this as his motto in regard to the general election which, whether it come this year or next, cannot now be very long delayed. The subject is engaging the attention of the daily papers, and a well-considered article in the *Daily Telegraph* points out that the concentration of motor cars which has distinguished by-elections, and has very often decided their results, will not be possible, at any rate to the same extent, when the general election is taking place. Still the use of motor cars at election times has had a very decided effect upon the electors, particularly on those classes who have never had, or who are not likely to have for some time, other opportunities of indulging in the new locomotion. The recognition of the value of the motor car for election purposes by the daily press, prompts us once more to impress upon our readers the great importance of putting to the motor car question above all others when considering to which of two rival candidates they will lend their car at election time.

EXAMINATION for Driving and Mechanical Proficiency Certificates will take place on the 28th instant at the Automobile Club, 119, Piccadilly, commencing at 10 a.m. Those who desire to avail themselves of this date should apply to the Secretary forthwith for particulars.

HIS MAJESTY KING EDWARD is reported to have had a narrow escape from a collision in driving from Buckingham Palace recently to King's Cross Station. A private omnibus came rapidly round a corner in front of the royal car, and it was only the great expedition of the King's driver in clapping on the brakes and pulling up with remarkable suddenness that averted a catastrophe. The sudden stop threw some of the arrangements of the car out of order, but they were quickly adjusted, and the King resumed his journey with apparent unconcern.

It appears that Mr. Stephen Coleridge has been again compelled to write to the daily papers, as, owing to some misunderstanding, his letter, which we quoted, stated that the police "lied upon the wayside," when he really intended to say that they "hid by the wayside." Mr. Coleridge has explained the mistake, but he has omitted to take advantage of the neat rejoinder he might have made, that after all he was only mistaken in regard to the *place* where they "lied."

BRITISH EXPORTS AND IMPORTS OF MOTOR CARS, &c., FOR 1905.

NOTE.—For 1904 comparative figures see full table for the year in our issue for January 21st, page 91.

Imports.

1905.	No. of Cars and Value.	Parts Value.	No. of Motor Cycles and Value.	Parts Value.
January ...	362	£ 149,578	57	£ 1,842
February ...	431	£ 195,978	102	£ 3,748
March ...	560	£ 239,091	152	£ 5,369
April ...	544	£ 225,012	192	£ 6,477
May ...	728	£ 327,008	280	£ 8,274
June ...	557	£ 259,359	211	£ 6,581
July ...	675	£ 277,738	212	£ 6,931
August ...	505	£ 230,568	116	£ 3,912
Total ...	4,362	£ 1,904,332	1,322	£ 43,134

1905.	Exports, British and Irish make.				Foreign and Colonial Re-exportation.			
	No. of Cars and Value.	Parts Value.	No. of Motor Cycles and Value.	Parts Value.	No. of Cars and Value.	Parts Value.	No. of Cycles and Value.	Parts Value.
January ...	77	£ 25,590	58	£ 2,026	50	£ 19,006	8	£ 214
February ...	62	£ 20,209	63	£ 2,389	79	£ 39,772	2	£ 54

TOURIST TROPHY RACE.—The Vauxhall Car, which has a three-cylinder engine and a gear-box giving six forward and two reverse speeds. The gear-box primarily gives three speeds, but by providing an alternative drive to the lay-shaft through a different gear-ratio each "speed" is thus duplicated.

COMMERCIAL POINTS.

Motor 'Bus Tyres.—The life of tyres on motor 'buses is an all important question, and information respecting the actual performance of tyres in use on public service vehicles is accordingly of considerable interest. In this connection the Sirdar Rubber Company send us a reproduction of an official order received by them from the London General Omnibus Company, on which it is stated that a set of tyres on the front wheels of one of the company's motor 'buses have lasted 11,000 miles, a clear gain to the Sirdar Company, as we understand from them that the guarantee is for 10,000 miles.

We learn from Price's Patent Candle Company, Limited, that their special motor car oils are being used by quite a number of the vehicles entered for the Tourist Trophy Race, and that their motor oils are specially stocked in the Isle of Man by Messrs. Brooke and Co., Ramsey, Mr. J. R. Corlett, Douglas, and Mr. M. Hampton, Douglas. This information arrived too late for publication last week, but no doubt it should be of use to automobilists who are in the island for any lengthened period.

"Continental" Tyre Development.—The additional works being erected at Hanover will be completed by the end of the year, and will provide employment for about 800 new hands, mostly devoted to the manufacture of motor tyres. The company, we understand, also intend taking larger premises in London in order to cope with their increased business over here.

SOME splendid specimens of high-powered racing and touring cars may at the present moment be seen at the show-rooms of Messrs. J. E. Hutton, Limited, 81-83, Shaftesbury Avenue. The cars specially on view are: 90-h.p., 70-h.p., 60-h.p., 40-45-h.p., 28-32-h.p. Mercedes, and 50-h.p. Panhard. As these represent the most recent types turned out by the works and embody the latest improvements, motorists who are looking out for chassis capable of taking heavy touring bodies comfortably, should pay Messrs. Hutton an early visit.

NEW COMPANIES REGISTERED.

[Taking powers to manufacture or deal in motors, motor cars, or accessories, either as their principal or part of their objects.]

Barry Motor (Limited), 9, Gracechurch Street, E.C.—Capital, £20,000 in £1 shares. Object, to manufacture and deal in the Barry motor. First directors, W. A. Richards, A. Richards, and R. H. Richards.

Carnarvon Motors (Limited).—Capital, £1,000 in £1 shares.

Chenard-Walcker Motors (Limited), 38, Long Acre, W.C.—Capital, £10,000 in £1 shares (5,000 preference). First directors, D'Arcy R. Baker, V. H. Miller, and G. Oakey.

J. C. Coates, (Limited), 65, Manchester Road, Burnley.—Capital, £1,000 in £1 shares. Object, to acquire the motor and bicycle business of J. C. Coates, 65, Manchester Road, Burnley.

Flewitt (Limited).—Capital, £5,000 in £1 shares. Object, to acquire the business carried on by J. A. Flewitt, of makers of carriages and motor and vehicle bodies, &c.

Hartenfeld, Son, and Company (Limited), 259A, Oxford Street, Manchester.—Capital, £1,000 in £1 shares. Object, to carry on the business of manufacturers and repairers of self-propelled or other vehicles, and accessories, &c.

Hay Motor Company (Limited).—Capital, £5,000 in 4,500 ordinary shares of £1 each and 10,000 deferred shares of 1s. each. Object, to adopt an agreement between W. G. Hay and E. Hart, and to carry on the business of manufacturers of motor cars, cycles, &c.

Horn, Littlewood and Company (Limited), 30, North Street, Gainsborough.—Capital, £10,000 in £1 shares. Object, to acquire the business of mechanical engineers, manufacturers of

motors, motor cars, &c., carried on at Gainsborough, Lincolnshire, as Horn and Co., and to carry on the business. First directors, A. A. Horn and R. W. S. Littlewood (works manager).

Motor Vehicles (Limited), 22, Broad Street, Bury.—Capital, £50,000 in £10 shares (2,500 five per cent. preferred). Chief Objects, to carry on the business of purchasers and letters to hire of motor lorries and vehicles, &c., with power to manufacture motors, rolling stock, and conveyances of all kinds. First directors (all directors of the Lancashire Wagon Company (Limited), A. Smethurst, J. H. Peacock, J. Battersby, J. P., E. Burgoyne, and T. F. Bradbury.

Norman Gears, (Limited).—Capital, £5,000 in £1 shares. Chief object, to adopt an agreement with E. J. de Normanville, H. J. Lee, W. P. McCarthy, and R. Hill, and to carry on the business of makers, repairers, and hirers of motors, motor cars, &c.

Samuelson and Company (Limited).—Capital, £100,000 in £5 shares. Object, to acquire the business of ironfounders, engineers, motor car and locomotive builders, carried on by Samuelson and Co., Limited (incorporated in 1888, and now in liquidation), at the Britannia Works, Banbury, Oxon.

Transvaal A.C. Reliability Trials.—The 12-14-h.p. 4-cylinder 1905 type Gladiator, which secured the cup and gold medal of the club in this event, travelled the whole distance of 210 miles, we learn, without a stop of any description. The course extended from Johannesburg to Schoeman's Drift, *via* Potchefstroom, and thence back to Johannesburg. A win in a trial of this sort is particularly gratifying, considering the many rough stretches, called roads in South Africa, which have to be taken during the run, and which have a nasty knack of locating any weak spots which may inadvertently exist.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

8914. 27th April, 1905. Improvements in Valve-Gear for Explosion Engines. James Melles, 21, Bahnhofstrasse, Brieg, near Breslau, Germany. In the known combined lift and rotary valve-gear in which the rotary valve acts as the controlling element, and the lift valve protects the rotary valve during the period of pressure in the cylinder, the rotary valve opens the exhaust port only when the lift valve is raised so that a throttling of the gases previously exhausted takes place. In this valve-gear the lift valve serves as the controller, and the rotary valve as the cut-off for the inlet and exhaust ports. There are six figures. Fig. 1, is a section of the improved valve-gear. The bevel pinion, 1, transmits movement in the ratio of 1:2 to the bevel wheel, 3, rigidly mounted on the hollow rotary valve spindle, 2, so that the rotary valve, 4, is uniformly rotated. By means of the tappets, 5, on the wheel, 3, the socket, 6, which is displaceable on and surrounds the lower part of the valve-rod, 7, is rotated, and moves over the roller, 9, mounted on the arm, 8. The valve-rod, 7, passes through the

cut through it which register with the inlet, 16, and the exhaust outlet. During the expansion of the ignited gases in the cylinder the rotary valve, 4, opens the exhaust port, 15, and shortly before the termination of this stroke, the lift valve, 10, is opened, and the burnt gases can freely flow out through the exhaust port. At the end of the following exhaust stroke the port, 15, is closed by the rotary valve, 4, whereupon at the dead point for the next suction stroke the inlet port, 16, is opened.—August 24th, 1905.

20861. 28th September, 1904. Improvements in Epi-Cyclic Change Speed and Reverse Gearing. E. J. de Normanville, 6, Clarendon Crescent, Leamington, H. J. Lee, Roselands, Ellys Road, Coventry, and A. Freen, Duryea Works, Widdington Road, Coventry. This invention has for its object to provide an epicyclic gear capable of being cheaply constructed, and adapted to give two or three speeds in a forward direction and a constant speed in a reverse direction. There are three figures. Fig. 1, is a longitudinal section of a three-speed and reverse.

Apertures are formed in the disc, a^2 , for the admission of a series of three broad intermediate planetary pinions, f . In conjunction with the annulus, i , a lateral extension, i^1 , is formed for engagement by a suitable clutch as k . Between the pinions, c , and upon supporting pins, d^1 , are the intermediate pinions, f , which are adapted to gear with the pinions, c , and also with the loose wheel, g , and an annulus, i , mounted upon the carrier discs, c and c^1 . When the high speed forward is required, all the brakes, m , n , and o , are released, and the annulus, i , is locked to the shaft, h , by the engagement of the clutch, k , with the extension, i^1 ; the independent rotation of the pinions, c and f , upon their pinions, d and d^1 , being prevented, the mechanism revolves as one. For obtaining the second or intermediate speed the clutch, k , is withdrawn from engagement with the portion, i^1 , of the annulus, i , and the wheel, g , is held by the brake, o , the annuli, i and i^1 , being free. The pinions, c and f , now rotate upon their pins, d and d^1 , and also around the axis of the shafts, b and h . The shaft, h , rotates at a slower rate than that of the driving shaft, b . For obtaining the slow speed, the wheel, g , and annulus, i , are freed, and the annulus, i^1 , held by the brake, m . The pinions, c and f , rotate round the shaft at a slower rate than in the second speed, and a reduction is effected in the speed of the shaft, h . By releasing the wheel, g , and annulus, i , and holding the annulus, i^1 , a reverse rotation of the shaft, h , is obtained.—August 24th, 1905.

spindle, 2. By the rotation of the socket, 6, the valve, 10, is raised when a projection, 11, on the cap slides on to or over the roller, 9. The projection, 11, extends for a distance of more than 180° around the circumference of the socket, and owing to this and to the fact that the gear is operated in the ratio of 1:2, the lift valve, 10, is caused to remain open during a whole rotation of the crank-shaft, that is to say, during the exhaust of the burnt gases and the suction of a fresh charge. As soon as the projection, 11, on the socket leaves the roller, 9, the lift valve, 10, is closed by a spring, 12. The cylinder or valve chamber is provided with water channels as at 13 for cooling purposes, and the sparking plug is inserted in the aperture, 14. The valve, 4, has ports

ing gear. A central driving sun wheel, a , is mounted upon or formed with the driving shaft, b . The sun wheel, a , is arranged to engage one-half of a series of three broad planetary pinions, c , rotatable on pins, d , having their extremities secured within carrier discs, c and c^1 , respectively. The carrier disc, c , is loosely mounted upon a sleeve, f , with which is secured a central sun pinion, g , whilst the carrier disc, c^1 , is secured to the driven shaft, h . Around the planetary pinions, d , and preferably in the same plane as the central wheel, a , is disposed, an internally toothed wheel or annulus, i , with which the pinions, c , engage. The annulus, i , is supported upon the carrier disc, c^1 , and a supplementary disc, c^2 , mounted upon the pins, d , of the pinions, c .

TOURIST TROPHY RACE.—The results of the Race at a glance. These four scoring boards, which were at the finishing point, are shown in our photographs as they appeared after the Race, and indicate very clearly the times and place in each round of every competitor. The arrangement was admirably carried out, and the figures were exceptionally and delightfully clear at a considerable distance. The identification of the cars by the official numbers is easy from the table given elsewhere in this issue of the Journal.

THE AUTOMOTOR JOURNAL.

Telegraphic address: Truditur, London. Telephone: 1828 Gerrard.

SUBSCRIPTION RATES.

THE AUTOMOTOR JOURNAL will be forwarded, post free, to any part of the world at the following rates:—

PASSING EVENTS.

The Tourist Trophy Race.

THE Tourist Trophy has been run and won, and there will be few found to deny that it has proved a splendid success, and when we say that we say a great deal, for the event was an innovation in automobile competitions, and it is a splendid testimonial to the management, organising powers, keen judgment, foresight, and, we might add, enthusiasm of the responsible committees, that the event of which the rules and leading features presented so many points of novelty should have been carried out without a hitch.

It will be a considerable time before it is possible to sum up and adequately realise all that the race has taught us, but some of its more obvious lessons are touched upon in the columns containing our report. One thing it has certainly shown, as we always said it would show, that it is possible to arrange an event for tourist vehicles that shall be won at a pace not outrageously in excess of what tourist cars are ordinarily called upon to do, and yet shall at the same time present all the attractive features, all the excitement and all the thrilling interest of a great race. Many people had been going about wagging their heads and saying that it would be a dull affair, a glorified consumption contest or reliability trial condensed into one day. These gloomy anticipations, needless to say, have been thoroughly falsified. Of course the element of enormous speed was absent; but no one who was on the course and who watched the proceedings with care—and there was a fine muster of

spectators representative of the general public—can refuse to admit that all the elements of interest which a race should display were present.

A Misapprehension to be Guarded Against.

THERE have been a certain number of accidents, and some people seem disposed to say how dreadful it would have been if the cars had been able to run at Gordon-Bennett speed. Well, for one thing, that was, of course, impossible under the conditions, but at the same time it should be borne in mind that certain other of the conditions under which the race was run, and which can and will be easily altered in the future, were the direct cause of the accidents which did occur. We refer particularly to the regulation by which competitors were compelled to carry sand bags as ballast instead of actual passengers. The sand ballast proved to be a most dangerous occupant of the car. At every turn it tended to swing the vehicles round, having no automatic adjustability of its own, and being of a semi-fluid nature, tended to shift in the wrong direction at exactly the wrong time. We do not expect to see sand ballast introduced again, so that a number of the accidents which did take place to the cars may be looked upon as merely resulting from imperfect experience of this class of competition, and will be obviated in the future. Another contributory cause was doubtless the stripping process necessitated by the ill-advised maximum weight limit of the chassis—the objections to which we have from the first strenuously insisted upon. These accidents, however, will probably be found to have brought their compensations, for their occurrence has certainly enabled manufacturers to ascertain the limits which can be safely approached in *everyday* touring car construction, and the public will at least have learnt that accidents, occurring with such vehicles as these, by no means necessarily result in injury to the occupants.

A Model Event.

THE Tourist Trophy Race, even as held under the regulations prevailing this year, has shown that this is just the type of competitive event which provincial clubs may well be able to copy in the future with advantage to themselves and the industry, for it will afford great interest to amateur drivers, and will have an invaluable educational influence on them. This is what the industry really requires for more than one reason. It is much better for manufacturers that private car owners should hold their own non-trade events, and that there should only be one great annual contest for which they (the manufacturers) would feel called upon to enter. Hitherto, the leading events of the automobile year have been of such a kind, and the general position of affairs has been such, that many manufacturers have been practically compelled to compete in self-defence. It has often been questionable whether the results have compensated them for the great expense and trouble involved. It is scarcely questionable at all that the effect in practically expelling amateurs from such competitions has been deleterious to the automobile movement. The majority of makers, therefore, would probably welcome the permanent establishment of a single great annual competition such as it is to be hoped the T.T. will become, which will bring out, as no other event yet held has done, the real relative values of the competing vehicles.

The event on the whole has shown—as we all along

maintained it would—that racing may be reduced to a practical form, that a good, interesting, and even exciting race can be carried out on useful lines, and be made to provide much of the information which has hitherto been only obtainable from a lengthy reliability trial. And it has shown that this can be done with tourist cars in everyday trim and under touring conditions. This means that there is now a good chance of entirely revolutionising automobile contests, and of making them applicable to real motor cars rather than to mere speed machines.

Woolgathering.

THE Motor Car Acts have been utilised to protect all sorts of abuses, nuisances, busybodies, and local authorities, but even a Magistrate has at last kicked at the determined attempt which was recently made at the South Western Police Court, to interpret the Motor Car Acts as designed to protect *sheep*. Mr. Charles Hines, of Westlands, Wandsworth, is the owner of a certain motor car. On a recent occasion his driver was driving the same along a certain road, and had the misfortune to collide with one of a drove of sheep, with fatal consequences to the unhappy ovine with which he came in contact. The police accordingly called upon Mr. Hines to give them information necessary for prosecuting his driver. This he very naturally and properly, justifiably and legally refused to do. Mr. Firth, who defended him, pointed out that the Motor Car Acts were intended for the protection of the public, and that it was at least doubtful whether *four-legged* sheep should be included in that designation. The same view was taken by the magistrate, and he accordingly dismissed the case, saying that he had no alternative, as Mr. Hines had chosen to stand upon his legal rights. We should like to know upon what else Mr. Hines, under such circumstances, could be expected to stand. This is just the very thing that one wants to know, and the Metropolitan Magistrate accordingly, like the Delphic oracle, refuses information about it.

Humanising Effects of the Motor 'Bus.

THE number of motor 'buses conveying the population of London to and from their business has gone on gradually increasing till now there are upwards of 100 in regular and steady service. The travelling public now knows well what the motor 'bus can do for it, and how much more expeditious it is between two points at which it touches than any other form of public conveyance, and there is no doubt that the superior speed of the motor 'bus to that of even the fastest hansom is having a very serious effect upon the cab industry of the Metropolis. It is satisfactory, therefore, to learn that the drivers of horse 'buses who have been sufficiently enlightened to become "converted" to the motor 'bus, and have exchanged the "ribbons" for the steering wheel, are reaping the rewards of virtue and enterprise. With somewhat superior pay to that enjoyed by the ordinary horse 'bus driver, the motor 'bus driver's hours are considerably shorter. The horse 'bus driver, it appears, is subject to the horrible slavery of driving sixteen hours a day on alternate days and nine hours a day on the days between. The motor 'bus driver gets off with eight hours a day, and has, consequently, as a representative of the profession has recently observed, time to get to know his family by sight, a privilege which is denied to the driver of most horse 'buses, whose children have frequently grown up to mature years without

making the acquaintance of the author of their being. This is one of the subsidiary advantages which the motor 'bus is bringing with it. Every motor 'bus which replaces a horse-drawn 'bus is relieving not only a team of twelve unfortunate 'bus horses from the most painful form of slavery, but is affording similar emancipation to the "converted" driver, and after all it is a certain benefit to the State that our 'bus drivers should have sufficient leisure to become personally acquainted with their families. It is only a small point, no doubt; but it is illustrative of the improved conditions which the substitution of mechanical for animal traction is introducing all round.

The Motor Barge—and its Opponents.

THIS is a wonderful country. Its co-efficient of inertia or "reluctance" is probably greater than that of any country on the globe, we refrain from adding the solar system. Last week we commented on the well-meant attempts of Sir Christopher Furness to impress the port of London with the value of the motor barge, and we suggested that the reason that motor barges were not practically in visible evidence on the Thames was because no manufacturers had laid themselves out to build them. But we must admit that we have experienced a shock on finding that the good people of the port of London are not merely ignorant of the advantages of the motor barge, but are actually convinced of the superior advantages of the oar and sail-propelled vessels, which do not greatly differ from those with which the Danes assailed the capital, and are certainly not a whit better than those on which Geoffrey Chaucer shipped his bales of hemp. The *City Press* has given hospitality to the opinions of one of these gentlemen. It is explained that the oar-propelled and sailing barge is superior on the Thames, as compared for example with Hamburg, because there are no canals for the motor barges to ply through. One wonders whether this kind of "blatherskite" can really be expected to deceive anybody. Anyone who knows the port of Hamburg knows very well that practically the whole of the motor barge industry is carried on on the waters of the Elbe only, and that only exceptionally does a motor barge find its way into the canals which radiate from the Alster. It is the same silly old spirit which has prevented progress in so many departments, and belongs to the class of prejudice which is doing more than anything else to hamper Great Britain in the difficult game of international commercial competition which is now pressing upon her so hardly.

Helping the Cause.

FROM time to time we have pointed out various methods by which the automobile public can assist the Joint Committee which is preparing the automobilists' case for the Motor Car Commission. Foremost amongst these has, of course, been the provision of adequate funds, on which we have regularly and repeatedly insisted. Another point has been the importance of every private individual who has any information bearing on the great question in his possession forwarding it at once to the Joint Committee. We have now to thank the Scottish Automobile Club for a further departure, enforcing another of the suggestions we have made, viz., the organised co-operation of local automobile clubs

with the Joint Committee. The Scottish Club (following the example of the A.C.G.B.I. and Motor Union) are sending out a circular to all their members covering a number of important heads, in regard to which information is desirable, and requesting answers to them as far as the individual experience and knowledge of the members can supply them. The conclusions, in due course, will be placed at the disposal of the Joint Committee. The Scottish Club is to be congratulated on this departure, and we hope their example will be followed by all the provincial clubs in the country. There is no better way by which the necessary information can be made available for the Joint Committee than by a propaganda of this kind.

The Same Old Arguments.

APROPÓS of the labours of the Joint Committee, Mr. Claude Johnson has done good service in making extracts for the use of the Joint Committee from the debates which were carried on in Parliament when the last Motor Car Act was under discussion. These extracts cannot fail to be of value to the Joint Committee, for they will show that the same arguments which are now being put forward by all the opponents of the movement, were fully and even superfluously voiced in those debates. Looking at the situation from another point of view, it becomes only too painfully apparent that the prejudice which these discussions revealed is as rampant to-day as it was in 1903. Certainly the impression produced from reperusing these old debates is that while the anti-automobile Members generally professed to hold a brief for their constituents, they were actuated by a degree of virulence which could only be explained by considerable personal feeling. It is this personal feeling in individual Members of Parliament that is really more dangerous to the prospects of the movement than the more or less bovine opposition of agricultural communities, and it is this that our propaganda should be mainly directed to getting rid of. A great deal can be done by personal argument and persuasion, and we fully realise that the automobile Members of the House of Commons have been and are doing their best in this respect. Something might be done by local automobilists and the local agents of the Motor Union to influence opinion in constituencies as well, and if to the persuasive arguments of the automobile Members of the House of Commons can effectively be added (as we have often urged should be done) the promise that motor car support at the next General Election will only be forthcoming on any scale for those candidates who are progressive on the motor car question, an effective step will have been made towards winning the campaign.

Police Stop Watches, price 4s. 11d.—Much fun has been made from time to time about the stop watches used by the Surrey police, but even they have never cost less than about 20s. Cumberland, however, beats Surrey hollow in fundamental economy in these respects, as it transpired at a recent motor car case tried at Carlisle that the stop watch with which one of the police witnesses was furnished cost the exorbitant sum of 4s. 11d. After all, however, why spend more upon them? The watches are always started and stopped to work out at so many miles an hour, and a cheap watch can do that as well as a dearer one!

THE TOURIST TROPHY RACE.

TOURIST TROPHY RACE.—Mr. J. S. Napier winning the race on his Arrol-Johnston Car. Our photograph is taken just before Mr. Napier crossed the winning line.

If it were only for the contrast offered by a race for touring cars over the now famous Isle of Man course, which has hitherto been sacred to "pure speed," the Tourist Trophy event could hardly have failed to appeal to the motorists who visited the island to witness it. There was a certain mystery about the situation which everyone fully appreciated; at previous events spectators knew what they were to expect from the giants of the course, but here was a new state of affairs altogether. The prospect of watching some forty odd cars competing in what was neither a simple race nor a handicap, but in some respects an automatic combination of both, appealed to all alike and sustained an unabated interest in the event.

So much has been written and so much has been said about this ingenious new form of racing, that everyone was agog to know how it would all work out. To say that opinions differed would be to state the case mildly indeed. Rumours and assertions as to speeds attained, and fuel consumed on practice runs, were everywhere in the air, and in no two cases were these statements in any way capable of being made to agree with one another. The atmosphere was positively alive with diametrically opposed rumours, and a general spirit of good feeling and jovial rivalry prevailed both before and on the day of the race. Many more people attended the meeting than were present at the Eliminating Trials in May, but naturally a large number of the spectators were drawn from holiday

TOURIST TROPHY RACE.—The method adopted for getting the cars to the starting point, so that the measured quantity of fuel might in no way be encroached upon except during the actual Race. The car seen in our photograph is Mr. W. H. Astell's 15-h.p. Orleans, driven by himself.

makers already in the Isle, and there were fewer visitors who attended specially for the event than there would have been had the meeting taken place in this country. It is a pity, too, that this was so, for the island is a charming spot, and although Douglas may not offer many attractions by itself, it makes a very convenient headquarters from which to tour the island.

Douglas was, of course, the centre of interest on this occasion, for the race being run without controls divested Ramsey and other towns on the course of the

attraction which they possessed at the time of the Eliminating Trials. For three days prior to the event, all the cars were "parked" in a large field at the back of the town, where they were weighed, sealed and filled up with petrol by the officials in charge—details to which we refer later—and it was here that everyone congregated to watch these somewhat monotonous operations, which were not, however, without their humorous side, as provided by the vagaries of the quadruple weighbridge with its awe-inspiring gallows for hoisting the bodies in a scientific manner, and the imposing apparatus by which the club gave to each car the allotted allowance of fuel.

Before nine o'clock on Thursday morning, all the cars had been ignominiously dragged out to the starting point by horses, and as the time for the start drew near, the forty-two vehicles were ranged in double file, silently waiting their turn for the word to go. Compared with the deafening cannonade of the racers at Quarter Bridge last May, and the excitement as each lurched and roared in eagerness to be off, this might have been a funeral, for

Not a "fire" was heard;

Not a trembler's note,

would be an apt parody to describe it. Precisely at nine o'clock, Mr. Woollen, the official starter, concluded his first incantation, and the race began by Mr. C. S. Rolls releasing the brakes on car No. 1, which glided swiftly and silently down the steep descent on to the course. For a few seconds nothing was heard, but as the car passed out of sight round a bend, the clutch was slipped in, and the familiar sound of the engine reached our ears, and we knew that the Rolls-Royce had taken its first sip at the tank full of petrol which must last it for the whole run. So it was with the remaining cars. Some took every advantage of the hill by not starting

TOURIST TROPHY RACE.—At the starting line. No. 1 car, Mr. C. S. Rolls' 20-h.p. Rolls-Royce, ready for the commencement of the Race. Mr. Clifford Earp is on his right, driving No. 2, Mr. S. F. Edge's 18-h.p. Napier.

Photo by Argent Archer.

their engines until they were well on the course, for the road is down hill all the way to Quarter Bridge; others let in the clutch almost at once; while Mr. Rawlinson even started the engine of his little Darracq in advance, and drove off at a great speed. The two White cars were also ready for work, with their "free" engines slowly turning, and emitting the peculiar, though hardly perceptible, "sh-sh" sound which is characteristic of steamers.

The best of good feeling prevailed among the competitors. For three days they had watched one another's cars being "signed, sealed, and delivered," by the authorities, and now they were free once more, each determined to make a sporting effort to win by going the fastest, and offering a suppressed prayer that an untimely failure of fuel might not nip their intentions in the bud while yet on the weather side of the winning post. Twenty-two and a-half miles to the gallon each, and every car had to run if it wanted to get round the full circuit, and as this included four climbs up Snaefell, prodigality in the use of fuel was not to be thought of,

so we will not inquire too closely into the opinion which Mr. F. S. Bennett formed of a pretty little miniature fountain, which he discovered had been in full play through the vent of his main petrol tank for some fifteen minutes preceding the start.

Hardly had the last car left when news of an accident to one of the Argyll cars (No. 17), driven by J. Downie, reached us. The Argyll had run into the wall of a house at the Ballasalla corner, it was said, and had sustained considerable damage. It was somewhat gloomy news to arrive so soon, and as a general move was made in the direction of the enclosure by the winning post, the impression that the inexperience of several of the drivers might speedily strew the course with corpses and wreckage began to gain ground. Starting the cars with intervals of one minute between each—instead of the two-minute intervals previously arranged—had taken under three-quarters of an hour, and even in the light of the numerous assertions by unofficial timekeepers that the course had at times been covered in "one hour twenty" on practice runs, no one seriously

TOURIST TROPHY RACE.—The run down on to the course from the starting point. Earl is seen just off on the 20-h.p. Simms-Welbeck.

expected to see the first car pass before half-past ten. At one minute to ten, however, a most extraordinary rumour spread like wildfire through the crowd—a car was seen on the road, and it was freely stated that Earp (No. 2) had passed Rolls (No. 1), and was about to finish the lap in the record time of "one hour dead." Considering that this would have been better time than was made by most of the racers in May, it was not altogether surprising that the credulous hopes of the excited spectators should be dashed to the ground when the car came closer and proved to be the "Pilot," which had been "doing" the course, so someone said, since seven o'clock in the morning.

After that little diversion, the onlookers settled down again, and, in the security of the belief that there were still a few minutes to spare before it would once more be necessary to crane their necks in endeavouring to identify an approaching car, began to study what manner of place it was in which they found themselves at the head-quarters enclosure. With the weather so gloriously fine, no pleasanter spot could have been desired than the large sloping field which commanded

a fairly good view of the course in both directions, and just a glimpse of the mountain road winding down Snaefell in the distance. Round about were numerous tents harbouring the time-keepers and officials, while banners proclaiming the names of tyres stood majestically in the background, and a large marquee in which the caterers held sway was not the least important item in the surroundings which contributed towards the general enjoyment of the event.

After a while, the news arrived that the 15-h.p. Orleans which had started ninth was first past the Bungalow, and at 10.47 the car sped past on its way to Quarter Bridge, followed within the next few minutes by its sister car, by C. Earp on the 18-h.p. Napier, and P. Northey on the 20-h.p. Rolls-Royce, the latter having averaged the very high speed of over 35 miles per hour during his first round. Almost immediately after these cars had passed, their times for the lap were painted up on the first of the large boards facing the enclosure, and from this they were diligently copied down by most of the spectators into neat little scoring-books which the Wolseley Company and C. S. Rolls and Co. had gratuitously provided

TOURIST TROPHY RACE.—The point at the bottom of the hill from which the start was made. The cars ran by gravity on to the actual course, at this spot. The car coming down is Mr. Pullinger's 16-20-h.p. Beeston Humber driven by Mr. C. H. Cooper.

TOURIST TROPHY RACE—Mr. Alexander Govan's 14-16-h.p. Argyll, driven by Mr. W. Parker Thomas, coming through Ramsey.

for the purpose. In batches of twos and threes the cars passed by, but still no sign of No. 1, and at last the news came that the first Rolls-Royce had smashed its gear. About the same time, information spread round that Mr. Tom Thornycroft had twisted a wheel, and although that intrepid driver is certainly capable of doing almost anything with his car, even his greatest admirers doubted his capacity to perform such a feat as buckling an *artillery* wheel.

But at last he hove in sight and the mystery was explained—his back axle had been bent beyond the off-side spring, and there was the wheel wobbling round for all the world as if it were buckled. At the time there was no intimation of the cause, for Mr. Thornycroft had evidently no intention of abandoning the race so long as the wheel remained as a support for the car.

By half-past eleven, nearly all the cars had successfully completed their first round, and information was beginning to trickle through the telephone as to the causes of delay to those which had not come round. The Wolseley Car (No. 10) had, it transpired, run into a hedge at a sharp corner and sustained a bent axle, and it was as the result of colliding with this car that the Thornycroft axle was bent.

Mr. F. S. Bennett, on his Cadillac, was reported to have broken two wheels, and according to his own account of the smash, this was due to taking one of the most dangerous corners of the course far too fast. In his jubilation at driving up a large part of the mountain on the top gear, he did not realise the speed at which he was approaching the turn; for a few moments the situation was dramatic, the spectators—who were in evidence all over the course—were divided in their actions, half of them cheered as they had cheered no other car before, so pleased were they at his high speed, and the other half, who knew better, were endeavouring to express their fears by shouting a warning. But it was too late, for as the Cadillac swung round the curve its two near side wheels broke through at the hubs in rapid succession and the car lurched over on to the ground, but happily without inflicting any injury to its two occupants. Mr. Bennett was not alone in being put out of the race from broken wheels even in the first round, for the Speedwell car (No. 7) and Mr. Rawlinson's Darracq (No. 40) were reported to be in the same plight. The sudden appearance of the Argyll car (No. 17), however, came as a pleasant surprise to all, and it gave some hope that the

TOURIST TROPHY RACE—The 20-h.p. Simms-Welbeck coming up the course out of Ramsey.

TOURIST TROPHY RACE.—At Ramsey. Mr. Percy Northey on the 20-h.p. Rolls-Royce car just about to take the right angle turn at Ramsey.

reports of other cars broken up *en route* might also prove exaggerated.

Between the end of one round and the beginning of the next, there was not long to wait, and the time was fully taken up by comparing the times of the various competitors, which by this had nearly filled No. 1 of the large "telegraph" boards shown in our frontispiece. By this it was seen that the Arrol-Johnston car (No. 53) was leading by about a minute and a half on the Rolls-Royce (No. 22), between which and the third car, No. 52 (Vinot), there was hardly half-a-minute difference in time. Further retirements were to take place during the second round; the other Darracq, driven by Mr. Lee Guinness, damaged its differential case through a skid at the "Bennett" corner, and one of the White steam cars (No. 28) broke a wheel at the Castletown corner; the other White, driven by Mr. F. Coleman, was also put out of the running through a broken pipe, the result, probably, of the "stripping" process to which that car had been subjected in order to pass the Clerk of the Scales. The 12-h.p. Vauxhall was also

missing, and presently information arrived that it had run into a tree and damaged a wheel; of the 16-h.p. Minerva (No. 37) no definite information was forthcoming, but a general sequence of bad luck was attributed to it, which included a bent valve-spindle, faulty ignition-plugs, and a loose cam. At the end of the second round, Mr. Guy V. Baxendale, on the other Thornycroft, gave up the race because of his bad luck with tyres, it having taken him nearly 5 hours to complete two laps. In much the same way that the Argyll turned up at the end of the first lap, the Wolseley car (No. 10) put in its first appearance during the second lap, and it then became known that the plucky driver (J. Hadley) had actually removed the bent axle, taken it to a forge to straighten it, and afterwards continued the race.

It was during the third lap that the first news of any car having exhausted its fuel supply reached the enclosure, where it was stated that the 14-h.p. Dixi (No. 42) was unable to continue beyond Ramsey. Most of the other competitors had passed the post up to time, but

TOURIST TROPHY RACE.—At Hairpin Corner, the bad bend above Ramsey. Mr. Percy Northey, who secured second place in the race, coming round this point on his 28-h.p. Rolls-Royce.

the 16-h.p. Humber (No. 24) did not turn up, and it was reported that the car had met with an accident, which resulted in a broken spring. The only other absentee was Mr. Tom Thornycroft, and everyone was thinking of all the numerous possibilities which could happen to a car with a twisted axle. Presently, however, Lord Russell came in on his 15-h.p. White, and told a graphic tale of how he had been following the Thornycroft car up the mountain when it was suddenly enveloped in flames. It was a horrid sight, said Lord Russell, who had hurried by, and pulled up in order to give assistance, but on looking round again he had found that the flames had disappeared, and no one was any the worse—it was only due to Mr. Tom Thornycroft "tickling" the carburettor, and to the petrol being squirted on to the hot exhaust pipe and ignited! But still this car did not appear in sight, and it was not until afterwards that the full story was unfolded, and then it was known that the bent axle was, after all, the true cause of the final stoppage. The undue strain caused the other half of the axle to separate from its spur wheel inside the differential casing, and the road wheel on that side proceeded, all unnoticed, to go on its own towards the ditch, gradually widening the "track" of the rear wheels until it extended for a considerable distance across the road. Then, when

tisans, who appeared to be perfectly certain of its ultimate victory. But there was still an interval of twenty-four minutes in which the Arrol-Johnston could win the event, and as this time decreased the first real excitement of the day began to be evident among the spectators. Everyone who could possibly procure a seat utilised it for standing on, and a constant watch was kept on the road in the distance for the first signs of an approaching car—and at last one came in view. At that distance, it was impossible to be sure of its identity at first, but soon the squat aluminium bonnet and low build of the new Arrol-Johnston car was unmistakeable, and as it mounted the hill and shot over the line everyone knew that it had won a hardly-fought race.

Third to arrive, was the Vinot car, which was only about five minutes behind the winner, and for this excellent performance it should be given full credit, for it was a standard chassis and had but three forward gears, so that it was naturally at a disadvantage compared with those cars which had four changes of speed. The other Arrol-Johnston secured fourth place, and a Rover car (No. 49) was fifth. A very noticeable and satisfactory feature is that each of the first five cars had established its relative position at the end of the first lap, and retained it unchanged throughout the race.

In all 18 cars finished, and full particulars of their

TOURIST TROPHY RACE.—Mr. Cyril C. Maudslay's 20-h.p. Maudslay Car passing at the foot of Snaefell.

the car went round a corner, the axle and its casing finally parted company altogether, and the car had to be abandoned.

Only twenty-eight cars were thus left in for the last lap, and of these the Siddeley, which was driven by S. Girling, gave up at the start on account of a choked radiator, which had been giving increasing trouble at every round. In other respects the car had run excellently, and the 65mm. [*sic*] Michelin tyres, which had been fitted to the front wheels, in order to reduce the weight, stood the strain wonderfully, and finished up without giving any trouble whatever. At the commencement of the last round, the Arrol-Johnston, No. 53, was only leading the Rolls-Royce, No. 22, by a little over a minute, and this advantage it lost by stopping to fix its silencer which had worked loose during the race. The Rolls-Royce car, however, was started a long way ahead of its rival, and it not unnaturally finished the race first, to the unbounded enthusiasm of its par-

running will be found in our carefully-compiled table. The clockwork regularity of Mr. C. Friswell's little Peugeot is worthy of special comment in these columns, as is the successful performance of the Napier and Orleans teams. Only one of the two Argyll cars finished, the other having come to grief through the damage sustained in the accident on the first round, which was finally responsible for shortness of fuel. The Maudslay, too, ran out of fuel, owing to distinctly indirect and unusual occurrences, for the engine literally swallowed its own throttle-valve and became a victim to dyspepsia; three times valves were changed in consequence, and driving "on the spark" naturally proved very uneconomical. The Wolseley car (No. 10) was unable to finish in time, owing to the delay caused by straightening the bent axle, though—like the Siddeley—it still had plenty of fuel for the journey. In comparing the performances of the cars which finished, by the aid of our table, we would draw attention to the

TOURIST TROPHY RACE.—Two views of the officials in the timekeeper's enclosure. Mr. T. H. Wooten, who is seen in both the pictures standing at the table, was not only in charge of the timing arrangements, assisted by Mr. A. V. Ebbelwhite and Mr. F. Straight, but also acted as starter.

column containing particulars of the miles per gallon run by each car, for, with but two exceptions, every car which completed the circuit had a quantity of petrol remaining in the tanks. Of these the two-cylinder 14-h.p. Dennis (No. 35) had over a gallon and a half to spare, and the 16-h.p. Swift almost as much.

In the evening, when everyone had once more returned to the hotels, opinions on the performances of the various cars and of the race itself were freely expressed. There is no doubt that the race was won at

a speed which far exceeded expectations, and there is just as little doubt that the favourable wind over the mountain was largely accountable for this. Regarding the race itself, the general opinion was extremely favourable, and especially did it prove an interesting and exciting event for the competitors. In a sporting competition, it was a genuine victory, and no one grudged the successful car its laurels; in fact, the only sign of feeling was a protest by a competitor, of which nothing more, however, was heard.

OFFICIAL ORGANIZATION AND INSPECTION.

The Preliminary Arrangements.

Prior to the race, three whole days were occupied by the officials in examining the cars to see that they complied with the rules, in sealing the petrol connections, in weighing the chassis with and without the body, in weighing the passengers and ballast, and in filling up the fuel tanks with the allotted quantity of petrol. On the Monday—the first of these three busy days—the time originally fixed for all cars to arrive in the field at Alexander Drive had been 10 a.m., but as a certain amount of misunderstanding had arisen, and comparatively few had put in an appearance, this time was extended to one o'clock. Each car on arrival took up

its appointed place with empty tanks in one of the two large tents forming the official garage, and by lunch time there were forty-two vehicles there. The six absentees—apart from the ten withdrawals previously announced—included the two Daimlers, the second Star, the Mors which was to have been driven by Miss Dorothy Levitt, one of the Swift cars and the Gladiator. This Swift was the vehicle driven by Mr. de Wilton which overturned at one of the sharp corners on the course during practice the previous week, and there was some uncertainty even up to the Tuesday as to whether it would be allowed to run. Mr. Harvey du Cros, jun., in the belief that he would get a day's extension from the officials, managed to have it repaired in marvellously short time,

TOURIST TROPHY RACE.—The 14-h.p. Vinot Car, driven by Mr. Norman Littlejohn, being signalled by Mr. Orde to stop on the completion of the 4th round, this car securing third place in the race.

E

TOURIST TROPHY RACE.—The 14-h.p. Wolseley Car, No. 10, driven by Mr. James Hadley, just completing the 3rd round above Quarter Bridge.

and it was, we learnt, out on the road again in plenty of time to compete ; it was, however, not permitted to run in view of its late arrival. The Gladiator was withdrawn owing to damage sustained during the last day of practice on the course, when the brakes had to be applied with great force, suddenly, in order to avoid some cows on the road ; the foot-brake and a portion of the gear-box were injured in such a way that the necessary repairs could not be effected in time.

As a result of the first day's inspection by the officials, the petrol tanks on one or two of the cars had to be altered. For the purposes of the race, and owing to the unusually large capacity specified by the rules, special tanks had been fitted in the tonneau portion of the bodies, and these were objected to as not complying with touring car requirement. Both the Napier cars, and both the Thornycroft vehicles had their tanks removed from their original positions ; they were fixed beneath the front seats instead.

On the Tuesday, the four weighing machines constituting the special weigh-bridge were ready, and (once a start had been made) little time was lost in weighing each car with its body, and then each chassis. Horses were in attendance for hauling the cars to and from the tents, and the process of weighing went on gaily until dark, but was only completed the next morning. In most cases it was only a formality, but in one or two instances the chassis weight was found to exceed the 1,600 lb. limit, with the result that a stripping process was imposed on those competitors. Ultimately, all the forty-two cars successfully passed the clerk of the scales, Mr. Lyon Sampson, and the other assisting officials.

On leaving the scales, the cars were reassembled by their owners, and each competitor was allowed to test his petrol connections by driving the car for a short time in the field for this purpose. Tanks, petrol pipes and carburettors were then emptied once more, and the "sealing" officials for a while took possession. Every

cock, union or other fitting through which petrol could have been introduced surreptitiously into the fuel system was sealed, with the exception of the filling cap, prior to the official filling operation of the Wednesday, when the final seal was to be placed upon this fitting also. The work involved was especially arduous in the case of cars having a pressure-feed system because of the additional pipe-fittings and the hand-pumps, and indeed some cars appeared, when finished, to be bristling with wired-up parts and A.C. initials. This process lasted until dark both on the Tuesday and the Wednesday.

The filling-up process began about mid-day on the Wednesday, when $9\frac{1}{2}$ gallons of petrol was fed by means of special measuring apparatus into the tank or tanks of every competing vehicle. This quantity is approximately equivalent to an allowance of one gallon for every $22\frac{1}{2}$ miles, and was deemed by the club to be equivalent on the Isle of Man course to one gallon for every 25 miles of the London to Oxford road when dry. Up to this day, no announcement had been made as to the precise allowance that would be made for the race, but rumours had got about, and it was generally believed that a still greater quantity of fuel would be given. Nevertheless, there were amongst the competitors those who considered the actual allowance too liberal, as well as those who took a reverse view of the case.

Every competitor had been given the chance of specifying which brand of fuel should be obtained by the club for his car, and those who had not availed

themselves of this opportunity were supplied with "Shell" spirit. Two filling machines were in operation, and although the operation was slightly delayed by having to deal with various well-known brands—including Carless petrol and Pratt's motor-spirit—every tank had been filled and sealed by nightfall, and each car was ready for the fray on the morrow. During this final day of preparations, everyone but the officials themselves were excluded from the tents.

The Arrangements on *The Day*.

The A.C.G.B.I. are much to be congratulated both on the effective manner in which they overcame the many apparent difficulties of organisation around the entire course, and on the really phenomenal luck that crowned their efforts on the day of the race. Inadequate observation in the absence of official observers on the competing vehicles, delays at railway crossings, and the occurrence of serious accidents, were the chief troubles to be anticipated on this occasion. Each and all were carefully taken into consideration. Practically no car throughout the day remained out of sight of some official for more than a few minutes, for—apart from the observers stationed at all important points—many of the members of the Races and the Technical Committees were provided with official cars, which circulated over the entire course, and were able to swoop down on any competitor within a few moments if he ever came to a standstill from any cause whatever. The first of these

vehicles—Lord Russell's White steamer—left the starting point a few minutes after the last competitor had been despatched by Mr. T. H. Woollen, the official starter, and this was followed at intervals by others, including another 15-h.p. White steam car, an Orleans, a Martini, a Dixi, Mr. Orde's Daimler, and the 6-cylinder Rolls-Royce car, which had been placed at the disposal of the officials for the whole week. These official cars also enabled the clerks of the course to personally attend to each crossing at train-time, in readiness to "time" the duration of any compulsory stops at the gates. Curiously enough, no car was even called upon to slow up for a crossing throughout the whole day, thanks partly to the smartness with which the gates were worked by the railway officials, and to the provision of two locomotives for every train. This extraordinary piece of luck, however, was only in accordance with the glorious fineness of the day, and the immunity of those on partly wrecked cars from any injury.

In the way of warnings to the drivers, blue flags and red flags, hung across the road, gave ample notice in advance of danger spots, while even the red cross flags, which denoted the positions of the 34 ambulance stations and first-aid units, doubtless served a somewhat

similar purpose. Telephonic communication was established between eight important points and the club enclosure, and thus all the various happenings of the day were soon known at headquarters. There, the four large "telegraph boards" were kept up to date to show the progress of the race, while other smaller boards served a similar purpose at other popular points in the island. By way of securing full details as to the times made over individual parts of the course, the stationary observers were, we understand, provided with special time sheets on which to keep the necessary records,

The Arrangements After the Race.

Immediately after the race was over, all those cars which had completed the full course returned with unbroken seals to the garage tents for examination, and the official "petrol" car—a Maudslay—set off round the course to dole out fuel to those competitors who were stranded for want of it. The first few cars that headed the list as winners were re-weighed, their seals were inspected, and the contents of their fuel tanks measured that evening, the remaining finishing cars undergoing a similar examination next morning.

POINTS FOR REFLECTION.

UNMISTAKABLY, the unanimous opinion of those who attended the race—public, manufacturer and competitor alike—was that it had proved a thorough success, and that this new type of contest for touring cars had justified in practice the hopes of its most ardent supporters. True, it was realised that in certain respects many very important improvements are called for in the rules, notably in abolishing or at any rate raising the maximum weight limit of the chassis, but there was no lack of testimony to the great value of the contest to the purchasing public and to the industry generally, and the enormous amount of useful knowledge that it has already brought about.

Non-freaks.

Although, moreover, it was evident, as shown by our special table last week, that certain modifications had been made in standard models to render them specially suitable for the race, yet it is not too much to say that in no previous event has there been less in the way of real "freaks"—certainly in no speed contest. The chief deviation from ordinary practice was in the gear-ratios of the change-speed-mechanism, many cars having an abnormally high top speed which very materially improved their racing performances. It, nevertheless, came as a great surprise to all that so many practically standard makes of touring cars of from 15 to 20-h.p.

TOURIST TROPHY RACE.—After the Race. Officials drawing oil and measuring the petrol remaining in the fuel tanks of the competing cars.

could travel at so high a speed on the allotted fuel allowance.

Weight Limit.

As regards the maximum weight limit for the chassis, we have all along pointed out the drawbacks of fixing this at so low a figure as 1,600 lbs., and have also questioned the need for imposing it at all. Nothing could bring the absurdity of this existing regulation more prominently forward than a glance at such chassis as the Thornycroft and the Standard, all parts of which were perforated in order to reduce weight. It is not as though extra weight could give any direct benefit in view of the fuel limitation, and it was palpably ridiculous to see the White steamers being stripped of useful parts, to the tune of about 75 lbs., merely to comply with an unreasonable regulation.

Sand Ballast.

The question of ballast is one which thrust itself prominently forward during the race, many and bitter being the complaints of the drivers in general. Sand bags constitute a kind of load which seriously hampers corner-taking, for the action of the sand is sluggish, and

it tends to prevent any quick recovery. It would seem that even lead would be preferable to sand, because it would at least be but equivalent to an extra heavy chassis or body, and could be fixed to give a lower and more stable centre of gravity. Neither, however, could, of course, give the same recuperative action that is instinctively provided by passengers. There is very little doubt but that the sand bags were responsible for the many broken wheels at the sharp corners, and for the bad skids that, in spite of dry roads, landed some of the cars in the hedge-rows.

Wire Wheels.

Incidentally, an impetus will doubtless be given to the adoption of wire wheels, at least for racing, for we believe there was no case in which any of the many cars fitted with them experienced wheel breakages.

Fuel Allowance.

Although it might appear as though a fuel allowance of a gallon for 22½ miles on the Isle of Man course had proved to be too liberal, it must be borne in mind that the tanks had to be filled on the previous day, when even the weather prophets were unsettled in their own minds,

TOURIST TROPHY RACE.—After the Race. The cars being re-weighed the morning after the Race by Mr. Lyons Sampson.

and no reliable forecast was available. Taking even one section of the course—that on the mountain road after the stiff climb from Ramsey—it so happened that the wind favoured the cars and allowed top gears to be used for quite a considerable distance, although just previously, day after day, it had blown the other way and prevented their employment along this part of the road. Similarly, it appeared from all accounts that even the dryness of the atmosphere, or some other external influence, had an advantageous effect on the fuel consumption, to say nothing of the time gained by the drivers through the absence of fog on the mountain and greasiness at the corners. The figures which will appear in the special article dealing with our own recent fuel consumption tests, show the enormous effect of wind resistance on power required as the relative speed of the car and the air increases, and it should be noted that the portion of the road referred to above was particularly exposed to the weather, owing to the high altitude.

Tyres.

It is only fair to the tyre companies to point out that although there were a few tyre troubles, yet such as there were could not be attributed to faulty manufacture, or to ordinary wear and tear. The strains imposed were so enormous and abnormal at times that it is a wonder the majority of them stood up as they did, particularly as, in several instances, ridiculously light tyres were fitted in order to reduce weight. When artillery wheels are being broken on not a few vehicles, it would be extraordinary if none of the tyres were to suffer from the tearing action imposed at sharp corners.

THE popularity of an event is easily gauged by the attitude of the general Press, and in the *Morning Post* Mr. H. Massac Buist has been in a particularly happy vein with his descriptive accounts of the meeting. The following extract from one of his articles is especially witty, but it is very characteristic of the general "atmosphere" prevailing before the race:—

"It don't rain in France when it do," was an English mechanic's description of the weather conditions prevailing about the time of the Herkomer Trophy in Bavaria last month, and the

cryptic utterance may be taken to apply with equal aptness to the present case. "You look like one of those seals they've got in the Gourde Glen," is a common greeting to a party of motorists on their return from a practice run with mackintosh coats all dripping and glossy. Should it rain to-morrow it may be needful to make as generous a fuel allowance as a gallon for every nineteen miles; though to credit half the tales the bulk of the competitors are telling would lead inevitably to the conclusion that it would not make the least difference to them if the Automobile Club officials should quite forget to dole out the petrol until the cars drew up at the finishing post. "As far as I can make out," observes one listener, "at present it's more of a lying match than a motor-car competition—one hour and twenty minutes to the lap, with four up and on twenty-five miles to the gallon! Why, Campbell Muir, who doesn't care a rap for corners, only made one hour eighteen on a 40-horse Mercedes fitted with a racing body." "One hour twenty," repeats his assertion more solemnly than ever. "Of course, you weren't using any petrol when you came up Snaefell," remarks Mr. Charles Friswell with his imperturbable smile. "As for me, I'm getting so niggardly in my old age that my poor little Peugeot positively gasps for want of petrol all the time. The last few miles of every round are a perfect agony. I keep thinking, 'We're done now, we're done now,' but my blower has another puff at it, and on we go—oh, he is a splendid chap, that, bless his lungs!" Says Mr. Lennox, with a twinkle, "Oh! the Manx air's wonderful. When my car came over it was a 10-horse, but now I've taken off the coil it gives fifteen easily." "Let the judges decide," says somebody, "though what they want them for I can't think. Without them the first man past the post on the petrol given him wins the trophy; with them it may be that the prize will go to the last man home. I'm prepared for anything—with the Automobile Club the only thing you know is that you never can tell." "Oh! I see what the Technical Committee's for," says Mr. Tom Thornycroft. "It's their job to go and count the number of stones on the hill-climb, and say, 'Hullo! half a teaspoonful more petrol here—there's a big brick!'"

MICHELIN non-skid tyres were used on the Wolseley car, and these were, we understand, the only non-skids used during the race.

CONTINENTAL tyres being fitted to the winning car, Messrs. Arrol-Johnston consequently secure the One Hundred Guinea Cup which the Continental Tyre Company offered in connection with this event.

Owing to the great pressure upon our space, we have been compelled to hold over until next week the continuation of our special series of articles dealing with the leading aspects of the Tourist Trophy type of Race, and giving the results of our own practical tests.

A misapprehension to Mr. Ernest de Wilton's 10-h.p. Swift Car, entered for the Tourist Trophy Race in the Isle of Man, was mentioned by us last week. In the photographs reproduced above, the nature of the accident can be realised, the smash being a very bad one. Owing, however, to the enterprise of Mr. Harvey du Cros, Junr., the repairs were effected within 24 hours by means of special workmen, and the requisite parts being sent from Coventry as instructed by telegram. The replacements included a new back wheel completely built up, two new spokes to the front wheel, both front and back axles trued up, frame trued, steering column trued and repaired, and all levers straightened. A new steering wheel with all control levers. A new fan was fitted, the radiator repaired, and the entire body rebuilt. In spite of this exhibition of quick repair, the car was disqualified by the Judges for not being in place in time.

THE WINNING ARROL-JOHNSTON TOURIST TROPHY CARS.

THE chief peculiarities of this type of car, one of which won the Trophy, while the other came in fourth, are to be found in the engine, in the control, in the steering gear, and in the wheels. Of these, the engine and its control are by far the most important so far as deviation from ordinary practice goes, for not only has it horizontal cylinders, but it is of a specially "balanced" type and is governed by a "hit-and-miss" device acting on the exhaust-valves. The steering gear itself is of the screw and nut type, and the steering heads for the front wheels are raked considerably instead of being vertical. All four wheels have wire spokes and are shod with $8\frac{1}{2} \times 10\frac{1}{2}$ mm. "Continental" tyres.

As our illustrations show, the engine is fixed transversely beneath the low bonnet in front, both it and the 4-speed gear-box being secured direct to the pressed-steel main frame. It will similarly be seen that the car is of the live-axle type, with a short propeller-shaft to drive it, and with side radius-rods to tie the axle to the frame. Between the engine and the gear-box, a multiple-disc clutch of the "Hele-Shaw" type is fitted within the fly-wheel, in such a way as to allow fan-blades to form the spokes of the wheel. Both cars were geared very high for the race, the winner (No. 53) running at speeds of about $9\frac{1}{2}$, 22, $31\frac{1}{2}$, and 45 miles per hour at normal

engine speed (800 revs. per min.). The gear-mechanism is based on the well-known "Mercedes" pattern, with one sliding member for the 1st and 2nd speeds, another for the 3rd and 4th speed, and a third for the "reverse"; on the 4th gear a direct drive is obtained. A spring-drive device is introduced between the propeller-shaft and the bevel-pinion, there are roller bearings throughout the car, and the usual foot and hand brakes are provided.

Turning our attention now to the engine, it should first be explained that there are two horizontal cylinders formed by a single casting, and that these are open at

The Winner of the Tourist Trophy Race—the 18-h.p. Arrol-Johnston (No. 53), which was driven by its designer, Mr. J. S. Napier. Average speed, 33·9 miles per hour. Fuel consumption, 25·4 miles per gallon.

both ends, and lie parallel with one another above the two-throw crank-shaft. The cylinders, which are close together, are fixed across the car, but the crank-shaft is placed longitudinally. Each cylinder has two pistons, the united stroke of which is $6\frac{1}{2}$ inches, and each combustion chamber is formed by the cylindrical space between the two pistons. Ignition occurs alternately in the cylinders, and thus an impulse is given to the crank-shaft during each revolution. Each impulse is, however, transmitted to the shaft, through special rock levers, by two connecting-rods travelling in opposite directions, both pistons being forced outwards simultaneously. To couple up the pistons with the two connecting-rods, one pivoted rock-lever is mounted in each side of the crank-

TOURIST TROPHY RACE.—View of the victorious Arrol-Johnston Chassis, which completed the circuit of 208·5 miles, at an average speed of 33·9 miles an hour. The chassis, which is of the live-axle type, is peculiar for its two-cylinder horizontal engine, which has four pistons. A full description of these vehicles appears in this issue.

chamber, the lower end of the rock-levers carrying one end of the connecting-rods, and the upper end of the rock-levers being hinged up to a pair of pistons; each pair of pistons that travels outwardly in the same direction, in the two cylinders, are thus yoked up together.

The bore of the cylinders is $4\frac{1}{4}$ ins., and the engine, which runs at speeds of 200 to 1,100 revs. per min., develops 18-h.p. at 800 r.p.m. It has atmospheric inlet-valves, low-tension igniters that are operated from the same cams as the exhaust-valves, and an ingenious inertia governor forms a part of the actuating mechanism. The current is supplied by a magneto. The governor regulates the power of the engine at any desired speed by allowing one or both exhaust-valves to remain closed for a time; it, in turn, is controlled by a small wheel and feed-screw on the steering-pillar.

Other interesting features of the engine are that the united throw of the crank-pins is less than the combined stroke of the pistons, that no provision is made for varying the "time" of ignition, and that a force-pump continually circulates the lubricating oil through the engine when at work.

In their works at Paisley, which are admirably adapted for the manufacture of motor vehicles in large quantities, every facility has been provided for ensuring first-class workmanship, and special attention has been paid to the all-important question of suitable materials for each and every part of a modern touring car.

The Tourist Trophy Rolls-Royce Cars.

The car which succeeded in securing second place in the race, under the skilful guidance of Mr. Northey, is of the Rolls-Royce standard 20-h.p. type, and only differed from the sister vehicle in having slightly smaller cylinders. The bore is 95 mm. as against 100 mm., but the stroke is 127 mm. in both cases. As already announced, the special feature of the transmission mechanism is that the "direct-through-drive" is arranged for the third speed instead of the fourth speed.

The many other special features of this well-designed and extremely satisfactory make of vehicle have already received full treatment in our columns, so that it is unnecessary for us to give any full description here. When first the Rolls-Royce cars were placed on the market—

Assisting the Police, *alias* "Magistrates' Highwaymen" (Coleridge).—We referred last week to the praiseworthy efforts of the Automobile Association towards preventing unintentional breaches of the law by automobilists on the Portsmouth Road. Everyone knows how difficult it is to make quite certain on a nice open stretch of country road, slightly on the down grade, perhaps, that one is not exceeding the 20-mile limit by a furlong or so to the hour. So every good motorist is naturally thankful to the corps of cyclists who, under the Association's orders, were on the watch on Saturday and Sunday last to warn them when it appears that such excesses were being committed. Some of the cyclists were stationed on an attractive stretch on the Fairmile on the Cobham side of Esher, and other cyclist supporters of legality ranged in the neighbourhood of Peasemars, an almost more attractive stretch of open road on the other side of Guildford, others being in evidence at the top of Payne's Hill on the Wisley side of Cobham. The cyclists' warnings were attended to by the automobilists instantaneously, and an admirable object-lesson was

just prior to the last Paris Salon—we gave a very fully illustrated article dealing with their construction and design, this appearing in our issues of December 3rd, 10th, and 31st last. That article, taken in conjunction with the photographs of the T. T. cars reproduced on page 1114 two weeks ago, and with our special table in the same number of THE AUTOMOTOR JOURNAL, will be found to furnish all particulars that may be required. The competing cars on this occasion were geared up to 15, $24\frac{1}{2}$, 37, and $45\frac{1}{2}$ miles per hour at normal engine speed (1,000 revs. per min.).

The Tourist Trophy Vinot Car.

Except in respect of "gearing," this vehicle may be said to be an absolutely standard touring vehicle, without the slightest trace of "freakishness." It was geared high, no doubt, for at the normal engine speed of 900 revs. per min. it could travel at speeds of 13, $25\frac{1}{4}$, and $42\frac{1}{2}$ miles per hour, but, on the other hand, it is worthy of special notice that only three forward speeds were available. Of the chain-driven type (with two side chains), with a 14-h.p. vertical engine having four cylinders, and provided with an ordinary cone clutch, the vehicle is in its general design of quite an orthodox pattern. It is, however, one of the 1905 models which attracted our special attention at the last Paris Salon, for it, like the other cars made by the same firm, and exhibited on their stall, has many excellent features and is particularly well finished. One striking characteristic, which we mentioned at the time, is the ingenious manner in which the "Mercedes" type of change-speed-gear is operated.

The actual car, which did so well in the race, and came in third, was fitted with only one ignition system, and that a comparatively unknown system. It had low-tension "make-and-break" igniters of the "Caron" type, which might easily be mistaken for high-tension spark-plugs, since they are but little larger. Each igniter, however, contains the necessary magnetic device for operating the moving member automatically, and is merely connected up with the magneto through a "timeable" commutator. The bore and stroke of the cylinders are 90 and 130 mm. respectively, as stated in the comprehensive table which we published on page 1,110 in our issue of September 9th last.

accordingly provided of how anxious the majority of drivers are to avoid exceeding the speed limit, and how such excesses are almost always unconscious. The cyclist supporters of legality on the Fairmile stretch were successful in reducing the speed of upwards of 20 motor cars from, perhaps, slightly over 20 miles per hour to considerably less, while quite a number at Payne's Hill, and as many as 200 on the Peasemars stretch were similarly successfully admonished. By a curious coincidence, the police had thought fit to arrange "traps," or "measured furlongs," as we believe they prefer to call them, on each of these three stretches of road, and we are pained to find that the demoralisation resulting from a long period of "trap tactics" has reached such a point that the police positively remonstrated with the cyclists. The Surrey Joint Committee, which controls the County Constabulary, ought certainly, we think, to have its attention drawn to this attitude of the police. It really amounts to a scandal that harmless citizens engaged in doing their utmost to prevent breaches of the law, should instead of being supported and welcomed by the police be remonstrated with by them.

REPAIRING A PUNCTURE—A MODERN METHOD.

EVERY motorist knows, or thinks he knows, how to put a patch on an inner tube, but at the same time he will agree that it is seldom an ideal method of making a repair. Until recently there has been no other

That neither of these views are justifiable at the present day, we have, so far as has been possible in a comparatively short time, convinced ourselves, and, for the benefit of our readers, we now give a number of photographs illustrating in detail the process of effecting a vulcanised repair to an inner tube.

For convenience, instead of using a complete tyre, only a short length was employed, but the process—which was carried out with the materials supplied with the Harvey Frost "Car" Vulcaniser—was, of course, per-

Fig. 1.—The Harvey Frost "Car" Vulcaniser.—View showing the apparatus ready for use.

alternative to patching a tyre except sending it to the manufacturers for proper repair, and even now that the difficulties of vulcanisation have been, to all intents and purposes, eliminated by the introduction of an apparatus demanding only a conformance to stereotyped and very

Fig. 2.—The Harvey Frost "Car" Vulcaniser.—View of the case into which all the parts can be packed. This case measures only 10 in. × 6 in. × 6 in., and the whole "plant" weighs only about 20 lbs.

simple instructions, many motorists are shy at making such a radical change in their methods, either through a sense of mystery in the process or a feeling of insecurity in the result.

Fig. 3.—The Harvey Frost "Car" Vulcaniser.—View showing the component parts separately.

formed in the same manner as it would be when actually making a repair to a complete inner tube. Before passing on to the actual details of operation, however, it will be as well to give a brief description of the apparatus by which this type of repair is rendered possible, and to point out, for the benefit of those who have not hitherto interested themselves very much in matters relating to tyre manufacture, in what particulars this class of repair differs from that ordinarily made in the form of a patch.

Vulcanisation.

Rubber in its crude state bears no resemblance to the strong but elastic material which is familiar to everyone

in the form of inner tubes. In fact, in order to give the inner tubes of tyres their elasticity and tensile strength, it is necessary to impregnate the raw rubber with drugs, the principal ingredient of which is usually sulphur or antimony. These drugs are most carefully mixed into the pure rubber, and the resultant compound is a plastic mass which may be moulded into any shape. To convert this plastic mixture into the impervious elastic material suitable for tyres requires but one thing—the application of heat—and this final process, which brings about the necessary chemical changes, is called vulcanisation. There is a difficulty, however, in vulcanising rubber—which will appeal more strongly perhaps to those versed in the culinary arts—the compound must be neither under nor overdone, for if the former happens it will still be semi-plastic, while if overbaked the final product will be brittle. What happens during the vulcanisation process it is immaterial for the present purpose to enquire into, but that some chemical combination takes place—similar in a way to the combination of carbon and iron in steel manufacture—which alters the whole nature of the material, is obvious at a glance.

The principle of making a vulcanised repair will now be obvious. It is the rebuilding up of the damaged portion with prepared compound, *i.e.*, plastic “drugged” rubber, and the cooking or vulcanisation of the new material in place to form a homogeneous part of the whole. The actual joint between the old and the new material is ensured by the application of a compound which has been reduced to a liquid state by solution in naphtha, and, so far as can be ascertained from observation, the old and new materials do combine very perfectly at the joint.

In order to simplify the process of vulcanising such things as inner tubes, there have recently been placed on the market, by Messrs. Harvey Frost and Co., two vulcanising plants, one for the garages and the other—of which we give illustrations—for actual use on the car when touring. It may at first appear to be rather an elaborate proceeding to carry a private vulcanising plant in a touring car, but considering that the whole outfit

weighs no more than about 20 lbs. and packs into a neat case, which is only 10 ins. long, 6 ins. broad, and 6 ins. high, the suggestion is not only feasible but quite desirable, more especially as the repair can be effected in as little time as is required to properly apply a patch in the old-fashioned way.

The Vulcaniser.

The vulcaniser, Figs. 1, 2 and 3, is nothing but a small boiler, A, which is filled with water at the plug-fitting, A¹, and in the upper part, A², of which steam may be generated by the heat of a methylated spirit-burner, B. For convenience the boiler, A, is mounted on a stand, C, and for the purposes of regulating the heat the burner, B, is fitted with a sliding cover, B¹, while as an indication of the temperature the boiler has a small pressure-gauge, A³, and for safety, a relief valve, A⁴, which “blows off” at 80 lbs. per sq. in. steam pressure. When filling the boiler it is only necessary to remove the plug, A¹, and pour in water until it overflows; once filled the water may be left in for ever, although it will be advisable to occasionally remove the plug and make good any deficiency due to such escape as may have taken place through the safety-valve. It will be noticed, from our illustrations, that the boiler is cast with a central flue, A⁵, to expedite the steam raising by providing a larger heating surface. For the purpose of holding the tyre in place there is a stirrup, D, which hooks over two pins, D¹, cast in the boiler shell, a thumb-screw, D², and a plate, D³—the whole forming a kind of press whereby the object to be vulcanised may be forced down against the hot surface of the boiler.

Assuming now that the apparatus is to be brought into use, the first thing to do is to fill the burner, B, with methylated spirits, apply a light, and set in position under the boiler, where it may be left while the damaged tyre is being prepared. As it only requires about twelve minutes to raise the steam to the necessary pressure of 65 lbs. per square inch, it will be seen that the vulcaniser will in all probability be ready before the damaged tyre is properly prepared.

(To be continued.)

More “Ticketing.”—A case recently came before Mr. Plowden at the West London Police Court, in which the owner of an automobile was summoned for “driving an unregistered motor car,” the circumstances being that, ignorant of the law, he had omitted to have the registration of the vehicle transferred to him. Apropos of this, Mr. Plowden remarked “how much simpler it would be if the name and address of the owner were on every car,” a proposal which Mr. Muskett, who prosecuted, hailed with delight, and suggested should be put before the Motor Car Commission. Magistrates, like other people, are not above speaking first and thinking afterwards, and in the name of automobilists we must venture to record a most emphatic prayer that the Motor Car Commission will reject any such suggestion. The reason why the register of motor cars is not open to the public is for fear of the blackmailing to which owners would otherwise be subjected. To compel them to put their names and addresses legibly on the cars they own and drive, would simply be to render the path of the unscrupulous blackmailer easier. Their troubles are sufficiently numerous as it is, without others of such a terrifying kind as this being added.

An Eton Problem.—It seems that the motor car is providing a problem for the authorities at Eton. Once upon a time the more elaborate Etonians used occasionally to slip off on half-holidays and come up to London to amuse themselves. This state of affairs continued, and was, perhaps, more or less winked at, till a Cabinet Minister once complained to a headmaster that he met his son one Saturday afternoon coming out of a popular London theatre, when he had supposed him to be playing cricket or acting as a “wet Bob” at Eton. After that the porters were instructed to watch the outgoing trains, and it became almost as difficult for the Etonians to go *incognito* to London as for a political exile to return to St. Petersburg from the Siberian provinces of happy Russia. Now, however, the automobile has come to the rescue of the Eton youths, and the perplexity of the masters, for those who can commandeer, borrow, or own cars, mask and goggle themselves in such a way that even an Eton porter cannot be certain of their identity, and they get up to the Gaiety and other places in not much more than an hour. Eton is waiting with interest to see how Dr. Lytleton will deal with the situation.

THE MANOGRAPH—ITS UTILITY AND CONSTRUCTION.—PART II.

The Construction of the Manograph.

THE complete instrument, mounted on its tripod stand, is shown in Fig. 1, where it will be noticed that it somewhat resembles a photographic camera in

movements of the same mirror, but has the effect of tipping it sideways instead of up and down. The two mechanisms are quite distinct from one another, although both are contained inside the comparatively small casting, A¹, and, therefore, it is this portion of the apparatus to which our illustrations chiefly refer. It is shown from several different points of view, both complete and in parts, in Figs. 2 and 3, but, before describing these mechanisms, it would be as well—with the assistance of Fig. 4—to explain the general arrangement of the apparatus as a whole.

The flame of the acetylene lamp, inside the chimney, E¹, comes immediately opposite an extremely minute hole that is drilled in the centre of a disc which otherwise completely closes the telescopic tube, A². Only a very small beam of light is, therefore, thrown into the instrument, and this is directed upon a prism, E², which occupies the position indicated in Fig. 4. This prism, which is shown separately at the bottom of Fig. 2, is mounted so that it can be adjusted, and it has the effect of throwing the diverging beam of light on to the mirror, D. The light is then reflected on to the screen, A³, the convex surface of the mirror causing the rays to converge and meet in a point. Normally the position of the mirror is such that the beam of light is thrown on the screen about three-quarters of an inch above its lower edge, but the two movements to which the mirror is subjected cause the beam to travel backwards and

Fig. 3.—The Manograph. Two views showing the arrangement of the mirror (D), and two corresponding views in which the mirror has been removed; in the right-hand lower corner the mirror itself is shown separately from the front and from the back, respectively.

appearance, for the body consists of a rectangular wooden box, A, into which no external light can find its way. Fixed in front—in much the same position as a lens—is the fitting, A¹, and it is this fitting that contains the only moving mechanisms. The projecting tube, A², which passes through the side of the box, A, forms a telescopic part of the lamp fitting, and the back of the box, A, can either receive the ground-glass screen, A³—which in Fig. 1 has been slid partly out to render it visible—or a plate-carrier for a photographic negative. The apparatus is complete in itself, and is adapted to be placed on the floor in any convenient position near the engine, but it will be noticed that there are three connections that then have to be made to it. The small pipe, B, terminates in a three-way cock that has to be fixed into the wall of the combustion-chamber, the flexible shaft, C, carries a taper plug, C¹, at its extreme end, to enable it to be coupled up to the crank-shaft, and the rubber tube, E, which feeds the burner inside the lamp chimney, E¹, has to be fitted to an acetylene gas generator. The copper pipe, B, and the flexible shaft, C, can easily be detached at either or both ends, and the latter has the usual stationary external casing, as well as a freely mounted sleeve—between the plug, C¹, and its universal joint—to enable the flexible shaft to be secured in place, even when the engine is running.

The copper pipe, B, enables the pressure inside the working cylinder to act upon the small mirror in the instrument, and the flexible shaft, C, also controls the

Fig. 4.—Diagrammatic sectional drawings showing the construction of the Manograph. The upper drawing is a vertical longitudinal section, and the lower is a corresponding horizontal section.

forwards, on the one hand, and upwards and downwards on the other hand, so that the beam can be projected upon almost any portion of the screen; the dotted lines in Fig. 4 indicate the normal positions of the beam of light.

Referring now to Figs. 2 and 3, the reference letters on which correspond with those in Figs. 1 and 4, the fitting, A¹, is first shown from the front, with the plug, B¹, the adjustment screw, C¹³, and the diaphragm, B², removed and placed alongside. To the right, it is shown from the back, with the plug, B¹, lying beneath it, and, in the lower portion of the same illustration, the fitting, A¹, is seen from above and from beneath respectively. All cover plates have been removed in these illustrations to enable the interior parts to be seen. In Fig. 3 a portion only of the casting, A¹, is shown from two different points of view, both with the mirror, D, in place, and also with the mirror removed, while, in the lower right-hand corner, separate views are given of the front and back of the mirror alone. The portion reproduced in Fig. 3 is that which projects through the main casing, A, into the interior of the apparatus, and will readily be recognised by comparing Figs. 2 and 3 together.

Since the mirror, D, is undoubtedly the most important part of the manograph, it is, perhaps, only natural to commence with it in this description. It is, it will be seen, balanced to the stationary pin, D², which has a tapering point that fits into the hole, D¹. The bracket in which the hole, D¹, is formed is of triangular shape, and is rigid with the mirror. The projecting arms, B⁵ and C¹, of this bracket rest, respectively, on movable pins, B³ and C², but these pins are normally prevented from tipping the mirror about its fixed fulcrum by the springs, B⁴ and C¹⁰, which press down upon those arms. The pins, B³ and C², are both capable of sliding

longitudinally in the holes through which they pass in the casting, A¹, and they are specially shaped and carefully placed, in relationship to the shapes and positions of the arms, B⁵ and C¹, so that the movements of the mirror, D, shall correspond in the desired manner with their own backward and forward travel. The pin, B³, can tip the mirror in such a direction that the beam of light reflected by it will be moved upwards upon the screen, and the other pin, C², can only tip it so that the beam of light is made to travel horizontally across the screen. The former pin is, as we shall now proceed to show, controlled by the pressure in the combustion-chamber, and the pin, C², is caused to move backwards and forwards in such a way that it keeps time with the piston in the engine cylinder.

The pin, B³, lies central with the plug, B¹, to which the copper pipe, B, is connected, and a chamber is formed in the casting, A¹, so that the plug, B¹, can hold a metal diaphragm, B², in place inside it. The diaphragm is firmly secured around its edge between the plug, B¹, and the main casting, and the centre of the diaphragm is then pressed up against the end of the pin, B³, causing it to slightly deflect the mirror against the action of the spring, B⁴. The outer face of the diaphragm is in direct communication with the combustion-chamber of the engine, and a gas-tight joint is insured. The diaphragm itself is therefore subject to movement backwards and forwards in accordance with variations of pressure in the engine-cylinder and its movements are transmitted to the mirror by the pin, B³. The movements of the diaphragm itself are naturally not proportional to the pressure, but the pin, B³, is so shaped at its inner end that a correction is made for this by varying the effective length of the lever-arm, B³.

(To be concluded.)

(H)andover Justice (?) Week by Week—As administered by Colonel Harmar, H. Nicoll, F. R. H. Sutton, C. F. Randolph, W. Cory, &c.—The Andover magistrates have adopted a variation in tactics. Not that they can claim originality in the departure, for other police courts have played the same game. It is a refined (?) method of applying torture to the victims to induce them to confess their guilt and be fined quickly. At the commencement of the proceedings the magistrates give notice that defended motor car cases will not be taken till the rest of the business of the court is disposed of, but that those who plead guilty can be fined and go at once. This means, of course, that the unfortunate automobilists who are gifted with a certain amount of obstinacy are kept hanging about the whole of the day, in order to obtain what remnants of justice may still flicker about Andover. In the good old days of the thumbscrew and the rack, if you made over all your property to Holy Church when first brought into the torture chamber, you were usually let off with at most a few digs of the red-hot pincers. If you maintained your innocence, well, in the end you had to "hand over" all the same. That the sole object of this precious Bench is Money! Money!—the alleged danger to the public being a mere pretence—is quite evident from the admission in one case which Police Superintendent Bowles had to make, that although representations had been made to the authorities as to the advisability of placing danger-posts at the particular "bagging" point, *nothing had been done*. Of course not! That would not suit the book of the great "(H)andover" unpaids.

THE inventiveness of some of our local authorities is quite entertaining. There are few things which they have not proposed in the hope of annoying motorists and hampering the development of the industry, but at present the Saffron Walden Rural District Council holds the field with a proposal that we should revert to turn-pikes so as to be able to exact sufficient money from motorists to relieve the local authorities who have to keep the roads in repair, and also to check "furious motoring." The Saffron Waldenites evidently remember that it was the excessive tolls that killed the old steam car industry. There is a quaint old medieval proverb, "You come from Saffron Walden: God help you!"—which we have never before quite understood, but now light is dawning.

PART of the campaign of the Motor Car Commission has been commenced by the Commissioner of Police, who is one of the members, and who appears to have decided to send round a representative to ask the magistrates of the Metropolis what their opinions on the motor car question are. Mr. Muskett, representing the Commissioner, appeared recently before Mr. Lane, K.C., and propounded the conundrum as to whether "in the magistrate's opinion a speed of over twenty miles an hour on a main road, like the Kensington Road, was not dangerous?" Mr. Lane returned what may be called a very significant non-committal reply. He said: "My opinion is that a proposition put on that basis is an impossible one, because it all depends on the driver, and the driver is so important an element that to assume the *pace of itself is dangerous to the public is idle*."

RACES, RECORDS, AND TRIALS.

occupants of the other car, the Peugeot was quickly pulled back on to the course, none the worse for its contact with the fence, and the driver—without having left his seat—after merely remarking that he “was taking a message to Ramsey,” drove off without another word, as if there was nothing unusual about the occurrence.

SUBJECT to the weather being favourable, further dust trials are fixed by the Automobile Club to take place near Reading to-day (Saturday).

Scottish Hill-Climb.—At Kirkfield Hill, near Lanark, on Saturday last the Western Section of the Scottish A.C. held a hill-climbing competition confined entirely to members of the Club. The event was purely a sporting one, and no entry fee was charged. The distance over which the cars were timed on the hill was 821 $\frac{3}{4}$ yards with an average gradient of about 1 in 9, there being no sharp turns from start to finish. The event was only open to touring cars, twenty of which competed, and all successfully succeeded in getting to the top of the hill. The chief results were as follows:—

				Time.		m.p.h.
				m. s.		
Wm. Weir, 15-h.p. Darracq (Mr. Kennedy's)	H.	1	40 $\frac{1}{2}$	16.7
O. R. Williams, 15-h.p. Darracq	2	7	...	13.2
S. M'Hutchon, 18-h.p. Peugeot	2	12 $\frac{1}{2}$...	12.6
P. P. Ness, 18-h.p. Mercedes	2	17	...	12.3
St. J. A. M'Onie, 15-h.p. Panhard	2	21 $\frac{1}{2}$...	11.8
D. T. Kirkpatrick, 16-20-h.p. Argyll	2	23 $\frac{1}{2}$...	11.7
J. G. Raphael, 15-h.p. Chenard-Walcker	2	25 $\frac{1}{2}$...	11.5
A. J. Fergusson, 16-20-h.p. Argyll	2	33 $\frac{1}{2}$...	10.9

Lord Raglan, the Governor of the Isle of Man, waiting in the rain on Snaefell to witness the race for the “Graphic” Cup on Friday, when, owing to the state of the elements, it was found impossible to run this event.

The Graphic Challenge Trophy.—On the day following the Tourist Trophy Race, it was arranged to hold a five-mile speed contest for the Graphic Challenge Trophy. This, the second race for the trophy, was doomed not to take place on that day however, for an impenetrable mist settled on the mountain, up which the course was laid, between Ramsey to the Bungalow, and it was impossible to allow the cars to start. The event was postponed indefinitely, although we understand that an attempt will be made to overcome the difficulties of holding the event in England.

This same mist was the occasion of a somewhat amusing incident. One of the Peugeot cars was despatched to Ramsey with an official message, and suddenly came upon a “thickly-populated” Humber car going in the opposite direction, at one of the numerous corners. The situation was a little cramped, but the driver of the Peugeot steered a course of his own choosing, and making straight for some iron railings, knocked them down and deliberately ran down a bank into a field. With the assistance of the

Southern Motor Club Hill-Climb.—The above Club held their hill-climbing contests for cars, tricar, and motor cycles at Tilburston Hill, Godstone, on Saturday last. Gold medallions will be presented to the winners of each class, Mr. F. C. Pattison (9-11-h.p. Clément) made fastest time up the hill, and also proved the winner on the handicap in the Car Class, his time being 2m. 41 $\frac{1}{2}$ s. Mr. F. Catling (8-10-h.p. Humber) was placed second, and Mr. W. Acton (15-h.p. White

TOURIST TROPHY RACE.—General view of the garage tent and enclosure where the cars were placed under official supervision before and subsequent to the Race.

and Poppe) third. The following was the handicap formula used:— Time in sec. \times H.P. In the Tricar Class Mr. C. H. Pugh ($3\frac{1}{2}$ -h.p. Minerva) climbed the hill in 2m. $3\frac{1}{2}$ s., while Mr. T. H. Tessier (4-h.p. Bat) in the Motor Cycle Class was timed for 1m. $5\frac{1}{2}$ s. The last two classes were run under a sealed handicap, arranged by Mr. F. Straight, of the A.C.C., and will be opened on Thursday at headquarters. The timekeeper at the top of the hill was Mr. A. Vickers, N.C.U., and at the bottom Mr. W. Pratt, Mr. Bygrave acting as starter. Between thirty and forty members and friends afterwards sat down to tea at the Clayton Arms Hotel, Godstone.

A MOTOR Gymkhana, with several novel features, took place at Portsmouth on Saturday last on the Officers' Grounds in delightfully fine weather. The winners in each event were:—

Ribbon Race for Cars.—The competitors in pairs were joined by a ribbon and had to follow a leader round a bending course. As each pair broke its ribbon it left the course. Ten pairs started. (1) Mr. T. Winans and Capt. G. R. Normand, R.G.A.; (2) Miss J. Larkins and Commander L. Mitchell, R.N.

Egg and Spoon Race (Motor Bicycles).—Seven starters. The competitors had to start dismounted, with the engine stopped, and had to cross a line 50 yards from start with engine going, spoon in mouth and egg in spoon, (1) Lieut. N. E. Nasmith; (2) Lieut. E. Douglas Jones, R.G.A.

Towing Race.—The cars were drawn up in two lines, 30 yards apart, and on a signal the rear line drove up, and took those in front in tow. Once round. Full complement of passengers were carried by each car, (1) Lieut. C. Good, R.N., and Miss J. Larkins; (2) Capt. G. R. Norman, R.G.A., and Com. L. Mitchell, R.N.

Race for Motor Bicycles (not exceeding 4-h.p.).—Riders had to start dismounted. Ten times round the course. Eleven starters, (1) Lieut. St. John, R.N.; (2) Sub-Lieut. G. Hebert, R.N. Won by 200 yards.

One Hundred Yards' Speed Race.—Course straight, standing start, engine running, gear neutral; (1) Mr. M. Grahame White, (2) Mr. T. Winans.

High Gear Crawl.—100 yards straight. Start twenty yards behind a line, high gear on when front wheels cross the line, after which breaks or clutch are not touched; (1) Lieut. R. M. Burmester, R.N., (2) Lieut. H. G. Vereker, R.N.

V.C. Race, Cars.—The start was from a line, the cars having to run backwards 100 yards, pick up a passenger (seated on a chair) on a line five yards off, who was carried to the car, and the cars then drove forward fifty yards to the finishing line; (1) Mr. T. Winans, (2) Mr. T. Jane.

V.C. Race, Tri-Cars.—(1) Sub-Lieut. St. John.

V.C. Motor Bicycle Race.—Both passenger and driver had to be mounted on the bicycle during the return journey. (1) Sub-Lieut. G. Hebert, R.N.; (2) Sub-Lieut. St. John, R.N.

Musical Cars.—The competitors, with passengers, had to drive round a circle, and when the music stopped the cars did so, when the passengers had to run to the central flag, the last arrival being "out" each time. Gentlemen as passengers, (1) Professor J. Dykes; (2) Captain H. A. Ramsay, R.A. Ladies as passengers, (1) Miss J. Larkins; (2) Lieut. H. M. Burmester, R.N. Two gentlemen and one lady as passenger, (1) Captain G. R. Normand, R.G.A.; (2) Mr. T. Jane.

Florio Cup.—For 1906 the prize money is to be very largely increased in connection with the Florio Cup recently run on the Brescia Circuit in Italy. Signor Figari, a rich Italian, has promised 100,000 lire in addition to the 50,000 lire given by Mons. Florio.

In regard to this race, M. Georges Prade, of *Les Sports*, has "re-constituted" the times of the race for each circuit by calculating the net time on each round of each car, allowing for the times occupied under the "re-spacing" arrangements at the three "time" controls. The figures are interesting, as showing the relative positions of the various competitors under these conditions in regard to actual speed for each circuit, and we, there-

fore, reproduce these below, the times being respectively for the first circuit, two circuits, and the three circuits, which constituted the full race:—

Semmering Hill-Climb.—On Sunday last, under the auspices of the Austrian A.C., for the seventh year in succession, the annual race up the Semmering Hill was successfully carried through. The best time was made by Braun, on a 100-h.p. Mercedes. He covered the 10 kiloms. (with a total rise of 400 metres) in 7m. $50\frac{1}{2}$ s., thus beating his own previous record of 8m. $11\frac{1}{2}$ s., and coming out with the best time for the third year in succession. The chief times in the other classes were:—

Motor Bicycles, under 50 kilogs.—Wondrick (5-h.p. Laurin-Klement), 9m. $15\frac{1}{2}$ s. Previous record, Nicodem (Puch), 10m. $21\frac{1}{2}$ s.

Motor Bicycles, under 65 kilogs.—(1) Weska (Puch) 9m. 4s. Old record, Bittner (Woricum), 9m. $45\frac{1}{2}$ s.

TOURIST CARS.

Cat. 1, under $2\frac{1}{2}$ litres cylinder capacity.—(1) Zeitlings (Peugeot) 20m. 40s.

Cat. 2, under $3\frac{1}{2}$ litres.—(1) Spitz (Mercedes), 14m. $17\frac{1}{2}$ s.

Cat. 3, under 6 litres.—(1) Hieronymus (24-h.p. Spitz), 13m. $23\frac{1}{2}$ s.

Cat. 4, under $8\frac{1}{2}$ litres.—(1) Mueller (Mercedes), 13m. 33s.

Cat. 5, above $8\frac{1}{2}$ litres.—(1) Braun (Mercedes), 11m. 45s.

The best times accomplished in the former years were:—

1899. A. Spitz (De Dion motor bicycle), 22m.

1900. J. Dietrich (De Dion motor bicycle), 14m. $38\frac{1}{2}$ s.

1901. Dr. Stern (35-h.p. Mercedes), 12m. $30\frac{1}{2}$ s.

1902. Werner (40-h.p. Mercedes), 10m. $37\frac{1}{2}$ s.

1903. Braun (60-h.p. Mercedes), 8m. $47\frac{1}{2}$ s.

1904. Braun (80-h.p. Mercedes), 8m. $11\frac{1}{2}$ s.

Gordon-Bennett Cup, 1906.—Mr. Gordon-Bennett, it is reported from Milan, proposes that in view of the abstention of the French and British clubs from next year's Gordon-Bennett Race that the Trophy should become the first prize in a big touring car event instead of for racing cars, and with this object the representatives of the various clubs are to be approached in order to arrive, if possible, at an understanding agreeable to all concerned.

Provence and Mont Ventoux Meeting.—The Mont Ventoux Hill-climb this year again formed part of the meeting arranged by the Salon A.C. The meeting opened on the 14th instant with speed tests on the Salon-Arles Road over 1 kilom. and 5 kiloms. (both flying start), the main interest in the latter being the securing of the Rothschild Cup for the best time. Collomb, on a Mors racer, proved the victor over the 5 kiloms., and

MONT VENTOUX HILL-CLIMB.—One of the stiff gradients up Mont Ventoux. The car is M. Giry's Svelte, which was the winner in the Tourist Car Class for 9,000 to 14,000 francs, with the time of 59 mins. 6½ secs.

tying with Stead's Mercedes over the 1 kilom. The chief results for the day were as follows:—

RACERS.—Heavy Cars.

Collomb (Mors) ...	5 kiloms.	2m. 0½s.	1 kilom.	26½s.
Stead (Mercedes) ...	"	2m. 6½s.	"	26½s.

MOTOR BICYCLES.

Demester (Griffon) ...	"	2m. 54s.	"	34½s.
Robert (Buchet) ...	"	2m. 59½s.	"	38s.
Lamberjack (Griffon)	"	3m. 4½s.	"	36½s.

TOURIST CARS.—Costing under 5,000 francs.

Riviere (Cottureau)...	"	5m. 10½s.	"	1m. 3½s.
------------------------	---	-----------	---	----------

Under 20,000 francs.

Mottard (La Buire)...	"	2m. 40½s.	"	35½s.
Fabre (Berliet) ...	"	3m. 29½s.	"	43½s.
Mouren (Bayard-Clement) ...	"	3m. 34s.	"	44½s.

Over 20,000 francs.

(1) Bablot (Berliet)...	"	2m. 50½s.	"	35½s.
(2) Batigne (Tourand)	"	3m. 15s.	"	50½s.

On the 16th the climb up Mont Ventoux commenced, the day being allotted to the tourist vehicles. The mountain road, the scene of the climb, is 21.6 kiloms. long, with a total rise of 1,895 kiloms., the gradient being 9 per cent. for a considerable portion of the way, with a final 100 metres of 13 per cent. at the top. The chief results were:—

Motor Bicycles.—1. Ruamps (Griffon), 27m. 9½s., previous record 51m. 17½s.; 2. Lamberjack (Griffon), 28m. 11½s.; 3. Demester (Griffon), 29m. 55½s.

Cars under 9,000 Francs.—1. Riviere (Cottureau), 56m. 16s., previous record, 1h. 15m. 44s.; 2. Aubert (Cottureau), 1h. 0m. 48½s.; 3. Vimont (Aries), 1h. 11m. 2s.

9,000 to 14,000 Francs.—1. Giry (Svelt), 59m. 6½s., Darracq record of 50m. 15½s. not beaten; 2. Marze (Cottureau), 1h. 2m. 39s.; 3. Champeyrache (Champeyrache), 1h. 5m. 40s.

14,000 to 20,000 Francs.—1. Didier (La Buire), 32m. 29½s., new category; 2. Fabre (Berliet), 33m. 21½s.; 3. Murreau (Bayard-Clement), 38m. 14s.

Over 20,000 Francs.—1. Mottard (La Buire), 24m. 19s., old record 33m. 50s.; 2. Bablot (Berliet), 28m. 56½s.

On the next day the racers showed their paces, and in this class Cagno, on one of the famous Fiat vehicles, proved to be the winner, he covering the 21.6 kiloms. in the marvellous time of 19½ mins., beating previous records by 2 mins. all but ⅓ secs. Rougier on his De

Dietrich, who last year was the winner, came within 15 secs. of Cagno. The results were:—

Heavy Cars.—1. Cagno (Fiat), 19m. 30s.; 2. Rougier (De Dietrich), 19m. 45s.; 3. Vitali (Rochet-Schneider), 22m. 27½s. 4. Collomb (Mors), 22m. 59½s.; previous record, Rougier, 21m. 12½s.

Voiturettes.—1. De la Touloubre (Darracq), 25m. 39½s.; previous record, Albert, 29m. 59s.

Motor Bicycles.—1. Lamberjack (Griffon), 25m. 48½s.; 2. Demester (Griffon), 28m. 35½s.; 3. Pons (Magali), 37m. 53s.; previous record, Ingilbert, 32m. 20s.

A bad accident occurred subsequently, during the descent, to Collomb's Mors car, which resulted in the death of M. Rol, a much respected member of the staff of our contemporary *Les Sports*. The Hunziker prize for regularity offered for the best combined performances at the Provence and Ventoux Meetings, was secured by Collomb with his Mors, he gaining 343 points. In the tourist cars Riviere with his Cottureau was first in the 9,000 francs category with 138 points, Mottard and his La Buire with 266 points was top in Cat. 3 (over 20,000 francs), and in motor bicycles (Griffon) was best with 253 points.

These points were arrived at by the addition of the average speed attained over the 1 kilom., the 5 kiloms., and up Mont Ventoux.

1906 promises to be a year of big touring events. Already the French Club are contemplating a lengthy course, and now the German and Austrian Clubs are proposing a similar project. It is suggested that the tourist run should be between Stuttgart, Vienna, Berlin, and Hamburg. The date would be arranged so that at Vienna the Semmering Hill Climb could be included, and speed tests over the kilometre and mile run on the Prater. During the tour, a speed contest is to be arranged on the Taunus circuit, under the immediate auspices of the German Club (with the moral support of the German Emperor), and if possible the run is to be so timed as to take part in the competition for the Herkomer Cup.

THE Duke of Abruzzi, it is hoped, will be the new President of the Italian Automobile Club in the place of the late Marquis Ginori.

MOTOR BOATING.

British Motor Boat Club.—The three days' race meeting, which this club is organising at Burnham-on-Crouch on 28th, 29th, and 30th, is receiving good support, and gives promise of some fine racing. We learn that there will be about five-and-twenty boats racing each day, amongst them being:—Brooke I., Napier, Napier II., Mercedes IV., Quicksilver, Pallas, St. Helena, Fiat, Javelin, Baby I., Baby II., Scout I., Takumono, Iris, Hummono, Omega, Z, Stirling I., Elgiva, and Viatic.

Menier Prize.—Continuing the Arcachon Motor Boat Meeting since our last week's issue, on the Wednesday the Menier prize was disputed, with the following results:—

Racers (30 miles).—(1) Napier II., 1h. 27m. 6s. (2) Napier, 1h. 29m. 56s. (3) Asmodee (24-h.p. Panhard motor), 2h. 23m. 26s.
Cruisers (15 miles), *boats under 6½ metres*.—(1) Mourguin (4-h.p. Couach motor), 2h. 32m. 30s.
6½ to 8 metre boats.—(1) Herald (24-h.p. Herald), 1h. 20m. 40s.
8 to 12 metre boats.—(1) Fefe (50-h.p. Filtz), 1h. 16m. 46s.
12 to 18 metre boats.—(1) Cazamoto (60-h.p. heavy oil motor), 1h. 38m. 52s.

SOME interesting motor boat races, which were held on the Hudson River, are reported from New York. The results were, over a distance of 30 miles:—

40 foot Boats.—(1), X P D N C (75-h.p. Mercedes motor), 1h. 36m. 2s.; (2), Veritas (200-h.p. Craig), 1h. 43m. 24s.
8-metre Boats.—(1), Dixie (150-h.p. Smith-Mabley motor), 1h. 32m. 49s.; (2), Shooting Star (50 h.p. Lozier), 1h. 38m. 28s.

On the 16th instant, off Long Island, a match between W. K. Vanderbilt, jun., and Howard Gould's boats, over a distance of 40 miles was run off, with the result:—

1. Tarantula (Vanderbilt), 1h. 53m. 1s.
2. Niagara (Gould), 1h. 55m. 49s.

In the run from New York to Poughkeepsie and back (175 miles), the "Proctor Smith" was winner in 7h 27h. 53s.

MOTOR CYCLING.

Auto-Cycle Club.—The penalty run of the club, taking place to-day (Saturday), will start from the Castle Hotel, Woodford, Essex, at 3 p.m., the competition being confined to members of the club and affiliated clubs. The run is a test of skill and driving reliability, a minimum time of 3½ hours and a maximum of 3h. 50m. being allowed for the distance of 68 miles. The route is on the Cambridge-Newmarket road, *via* Epping, Harlow, Sawbridgeworth, Hockerill, Ugley, Newport, Littlebury, and back, and each stop entails a fine of 6d., with a maximum of 2s. 6d. Failure to finish within maximum time entails 1s. fine; failure to finish within 5 hours, 2s. 6d. No pedalling is allowed, and in competing for the special prize, the best riding time to the minimum schedule will be counted as well as non-stop points. After the finish of the run, a concert will be held, under the auspices of the Essex Beaumont U.C., at the Castle Hotel, Woodford.

Motor Cycle Records.—Anzani, on an Alcyon motor bicycle, on the Parc des Princes track, on Sunday last, covered 93·78 kiloms. in the hour, and was timed for the 100 kiloms. in 1h. 4m. 14½s. His machine had a cylinder capacity of 90 by 90, but it was found subsequently that his machine somewhat exceeded the 50 kilog. limit and therefore the official record for the 50 kilog. machines still rests with Guipponi and his Peugeot machine, of 1h. 6m. 36½s. for 100 kiloms., and 90·36 kiloms. in the hour. Anzani can, however, claim to have accomplished the faster time on a motor bicycle on a track. Anzani's chief times were:—

Kiloms.	h. m. s.	Kiloms.	h. m. s.
10...	0 6 29½	60...	0 38 56½
20...	0 13 1½	70...	0 44 49½
30...	0 19 37½	80...	0 51 10½
40...	0 26 37½	90...	0 57 31½
50...	0 32 28½	100...	1 4 14½

CLUBS AND ASSOCIATIONS.

Inter-Club Meet at Ashby-de-la-Zouch.—The sudden change of venue from Buxton to Ashby-de-la-Zouch of the inter-club meet arranged under the auspices of the Nottinghamshire A.C., with which we dealt in our editorial columns last week, militated against a large gathering of cars at the new place of meeting. Instead of about 150 cars taking part, about thirty only mustered at Ashby, and most of these were owned by members of the Derbyshire Club. As the drastic step of changing the objective of the run at the last minute was taken by the Notts A.C., it is somewhat surprising that so small a muster from this club has to be recorded, as only the following were present to represent the club:—Messrs. Booth-Grainger (hon. sec.), 12-h.p. Gladiator; E. W. Joule, 12-h.p. Darracq; H. Belcher, 12-14-h.p. Talbot; Clifford, Jun., 10-h.p. Richard-Brasier, and Mrs. Shepherd, the very active lady member of the club. In addition to the large contingent representing the Derbyshire Club, representatives were present from the Leicestershire and Wolverhampton Clubs. The action of the Nottingham Club in transferring its favours at the last moment from Buxton to Ashby-de-la-Zouch, has been made the subject of considerable hostile criticism—on the whole, we think without adequate reason. Local opinion is bound, in the long run, to influence even benches of magistrates, and local opinion is likely to be rendered more effective in this respect by being made to see that high-handed and prejudiced action by local magistrates deflects valuable and paying visitors to other towns. When similar action was taken a few years ago in regard to Reigate, when the proceedings of that bench of magistrates were nearly as notorious as the doings of the Andover "Dogberrys" and "Snallows" are now, the townspeople made their indignation so felt that the Reigate magistrates repented and (doubtless reluctantly) mended their ways. We trust the same effect will be produced at Buxton.

The Society of Motor Manufacturers and Traders, Limited, and the Motor Car Commission.—The efforts of the Society of Motor Manufacturers and Traders to assist the Royal Commission on the Motor Car Acts by furnishing reliable statistics affecting the trade, are being seconded by the leading firms and agents all over the country, so that when the Commission meet on October 16th, Mr. T. F. Woodfine, the secretary of the Society, will be in a position to place much valuable information before them. The following firms have already sent in returns:—Armstrong, Whitworth and Co., Ltd., T. C. Aveling and Co., Ltd., Brampton Bros., Ltd., J. W. Brooke and Co., Ltd., Cannstatt-Mercedès, Ltd., Charles Jarrott and Letts, Ltd., Daimler Motor Co. (1904), Ltd., Duryea Motor Co., Ltd., S. F. Edge, Ltd., James and Browne, Ltd., Milnes-Daimler, Ltd., Panhard and Levassor, Straker Steam Vehicle Co., Ltd., Straker and Squire, Jno. I. Thornycroft and Co., Ltd., Ayr County Motor Co., James H. Scott (Melrose), John Rutherford (Jedburgh), Auto Machinery Co., Ltd., Central Motor Car Co., Coventry Chain Co., Car and General Insurance Co., Ltd., Dixon Bros. and Hutchinson, Ltd., Dennis Bros., Ltd., Engelbert and Co., Alfred Herbert, Ltd., London Motor Garage Co., Ltd., Moss, Ltd., Otto Bennett Motor and Engineering Co., Rotterdam and Sons, Royce Ltd., Rubery, Owen and Co., Ryder Motors, Ltd., Ryknield Engine Co., Ltd., S. Stevenson and Co., D. Stewart and Co. (1903), Ltd., Turner's Motor Mfg. Co., United Motor Industries, Ltd., Vulcan Motor Mfg. Co., Ltd., George Ace (Tenby), G. Cox (Southsea), Mann, Egerton and Co., Ltd., Tom Norton (Llandrinod Wells), Northern Cycle Mfg. Co. (Aberdeen), Nottingham Autocar Co., Ltd., Oxford Cycle and Motor Car Co., A. C. Perman (Dumfries), and Ross-leigh Motor Co., Ltd.

THE Motor Union has appointed the St. Ermin's Hotel, Victoria Street, Westminster, its social headquarters in London. Special terms have been arranged for its members.

Another Rural Council on the War-Path.—The Ripon Rural District Council has recently passed (of course unanimously) the following resolution:—

"That having regard to the material change in the character of the traffic upon highways, and believing that it will be necessary to effect an alteration in the method of road construction at an increased cost, the Council is of opinion that a proportion of such cost should be raised by an increased tax upon motor cars, the amount to be raised by such taxation to be divided amongst the several highway authorities in the country."

CORRESPONDENCE.

* * The name and address of the writer (not necessarily for publication) MUST in all cases accompany letters intended for insertion, or containing queries.

BRITISH INTERNATIONAL CUP.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—The ways and workings of the A.C.F. are, to say the least of it, most weird and wonderful, as the following details, *re* the Harmsworth Cup, will prove; perhaps the same may be of interest to your readers.

Being holder of the cup I offered to lend my New Trefle to Messrs. Richard Brasier to defend it, but they did not see the justice of the defending boat paying the exorbitant entrance fee of £20, so declined my offer.

I, naturally thinking there would be plenty of French boats to take up the defence, entered the New Trefle for the races in the Swiss and Italian lakes, which were held about the same time, and where she won everything in her class.

Hearing, however, just before the racing at Lake Garda that all the French boats had scratched, I instructed my representative in Paris to inform the A.C.F. that I was not only prepared to throw up the engagements at Lake Garda to defend the cup, and send the New Trefle by *grande vitesse* to Arcachon, but also if necessary to pay double entrance fees; he was informed by the secretary of the Committee du Yachting Sportive, M. Hocmelle, that it was too late and the New Trefle could not be entered under any circumstances. Now comes the farce of the thing. My cruiser Mab, fitted with sleeping accommodation, gallet, &c., which I had lent to the Claudel Carburateur Company to run for the Récopé Cup with heavy oil, was requested the day before the race to enter for the Harmsworth Cup, paying no entrance fees whatever, for the sake of making some semblance of a race. The same proposition was extended to the little 26 ft. boat, Loodit, of Bordeaux. After the treatment meted out to my offer to the A.C.F. in Paris, this came as a great surprise to me, as I knew nothing of the Mab's running until I saw the results in the papers. Comment is needless.

Yours very truly,

E. B. THURBON.

20, Rue Taitbout, Paris.
September 15th.

FOR THE CLERGY AND DOCTORS.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—Now that the Tourist Trophy Race, with its attendant excitements, is a thing of the past, it is possible that the manufacturers of automobiles may be induced to consider the needs of a humble but fairly numerous class. The country parson has in many cases been driven off the road by the motor, and has been compelled to sell his horses. He can no longer dare to hitch his nag to a cottage paling, and he dreads the return at night from distant occupations on account of the blindingly fiery acetylene eyes which pounce upon him from the darkness and frighten his steed to death. As with the parson so with the doctor and possibly many another dweller in the country. These unfortunates grumble, of course—all true Britons do—but they recognise the inevitable, and only ask that the tyrant spirit which has robbed them of one of their happinesses shall evolve a machine suitable to their pockets and their circumstances.

To the uninitiated the following appear to be the essentials of "The Rector's Car." 1. *Extreme simplicity*—a single cylinder if possible, and an entire freedom from intricate contrivances, however alluring; magneto ignition on account of the difficulty in charging accumulators. 2. *Reliability*—high speed is not required, but the *voyageur* must be pretty sure of "getting there," he is on business, not pleasure. 3. *Economy*—solid tyres will suit him better than pneumatics. 4. *A low price*—the car should seat four and be a good hill-climber, but it wants no plating or superficial magnificence, it is a car for a poor man, for one who buys, not because he wishes to, but because he must.

I am, Sir,

Your obedient servant,

Leeds.

PERSONA.

THE Car and General Insurance Corporation, Limited, have opened a West End office at 1, Albemarle Street (corner of Piccadilly) under Mr. H. F. Baker as Assistant Branch Manager, with two other Inspectors to assist him. It is hoped that this branch office will be of real assistance to the Company's large connections amongst those interested in the motor industry, especially in the West of London.

COMMERCIAL POINTS.

J. E. WILLIS, who possesses long practical experience, has commenced business in Dunstable as a repairer.

MR. E. H. LANCASTER, who was in the Isle of Man for the Tourist Trophy Trials, afterwards left for the South of Ireland to arrange agencies for 1906 Cléments.

MR. W. M. LETTS, of the firm of Charles Jarrott and Letts, Limited, left England on the 15th inst., for his annual visit to the States, sailing on the s.s. *Celtic*. His programme is to get through his business and to stay and witness the Vanderbilt Cup Race, returning to this country at the end of October.

THE Alnwick Motor Garage and Cycle Company, Limited, have recently completed their new works and garage situated in Bondgate Street, Alnwick. They have an excellent range of machinery for repairs, &c., all of which is electrically driven, whilst in the garage every provision has been made for the convenience of motorists in regard to inspection pit, lock-up cupboards, washing accommodation, vulcanising plant, re-charging accumulators, &c. Accessories, tyres, tubes, and other requisites are regularly stocked, skilled mechanics being always ready at a moment's notice.

MESSRS. RUBERY AND CO., of Darlaston, South Staffordshire, the well-known frame makers, have added their Mr. Owen's name to the style of their firm, which is now "Rubery, Owen and Co." Mr. Owen has been well-known in the trade for a considerable time, and has been concerned in the manufacture of thousands of frames of all descriptions since 1896.

The Walker Engineering Laboratories of the University of Liverpool have recently received a welcome addition to their equipment, this being the 7-h.p. Gardner engine shown in our illustration. It is the gift of the manufacturers—Messrs. L. Gardner and Sons, of Manchester—and will undoubtedly assist the University in providing its students with an up-to-date knowledge in matters relating to high-speed oil engines. The normal speed of the engine—which uses ordinary paraffin as fuel—is 700 revs. per min., the governor acts on the inlet-valve, and the ignition is effected by a magneto. It is fitted with a "Walker" fan dynamometer, and, when fixed to its permanent foundation, will be equipped with all the necessary indicator gear and other appliances for conducting careful tests.

TOURIST TROPHY RACE.—The Ryknield Car which secured fourteenth place in the event. It is of the live-axle type, and is peculiar in having a three-cylinder engine.

Practical Effects of the Tourist Trophy.—The successful manner in which the Tourist Trophy Race, and the extent to which it has concentrated attention on tourist cars, and the advantage of these facts to manufacturers and motor car agents generally, are well illustrated by the letter which appears in our Correspondence columns this week. The communication to which we refer is a *bona fide* letter from a country clergyman, and it is only at his special desire that we refrain from giving his name. He points out—somewhat sarcastically perhaps as regards the reasons he gives—but still trenchantly, that the light, cheap, simple, and above all reliable motor car is becoming in great demand amongst country clergymen. The poorest of country clergymen in most districts have hitherto been compelled to keep at least a horse and trap. Though the initial cost may be somewhat greater, they would doubtless not repent of exchanging their hippomobile for a light motor car. Our correspondent's letter proves that the Tourist Trophy Race, to which we have so persistently drawn attention, and to which we have devoted so many special articles, is already bearing fruit for the manufacturer.

NOBODY anticipated a few years ago that there would ever be within driving distance by road but the automobile has brought this to pass. Lowestoft is one of the most attractive of our seaside resorts, it is no small service which the car thus renders to its owners. Visitors to the "Queen of East Coast watering places" will find the little guide-book, published by the Town authorities, of considerable service. It is delightfully illustrated, and is well designed to show the intending visitor how numerous are the attractions both of the sea-front of the town and its immediate neighbourhood. A special feature of the country is the well-known Broads, and exceedingly picturesque old churches at Blundeston and Corton.

SIR FRANCIS WINGATE, the Sirdar of the Egyptian army, who, as we have chroni-

cled, has for a long time been making experiments with wheels suited for motor car traction in the desert, is taking back with him a 20-h.p. car provided with specially-shaped wheels, which have been developed by experiments on the sands at Dunbar. The car is designed to haul a searchlight apparatus with a view to throwing light on the proceedings of the wily Arabs at night time in the desert. The car is also provided with a winding drum, by which, like a ploughing engine, it can pull itself out of difficulties by means of an anchor.

It appears that the recent accident to Queen Margherita's car was, as surmised at the time, an intentional effort, and the Italian police have since captured several young men who have "confessed" that they are Anarchists, and that they were aware that the Queen intended passing by the route on which they laid the boulders. A display of the same charming spirit was again given on Sunday in last week, when Queen Margherita, attended by the Marquis Guiccioli and the Countess of Villamarina, was proceeding towards Neuchâtel. Some Swiss representatives of the same attractive ideas, it is reported, threw stones at Her Majesty's car and smashed one of the windows. The object of such acts is truly incomprehensible. The state of mind which prompts cowardly assaults of this kind on one of the most kind-hearted ladies in Europe must presumably be a species of homicidal mania, though possibly the presence of the Queen on each occasion in the car was not really known, and the attempts may be perhaps merely an example of anti-motor mania of the kind with which we are also somewhat painfully familiar nearer home.

At the present time, the motor delivery van shown in our photograph can be seen daily travelling round London on behalf of Messrs. Humber, Limited, delivering cycles at their various depots, &c. This is a unique instance of a cycle house using a motor van, which they have themselves constructed throughout, purely for the purpose of delivering their own manufactured cycles. The chassis is the ordinary 8-10-h.p. Coventry Humber pattern, with the exception that the wheel base is rather longer. Six bicycles in unpacked form, or twelve machines packed ready for shipment, or a load of 12 cwts. of ordinary goods, can be carried.

It was appropriate that the British Association in South Africa should take into consideration the prospects of automobilism in the various South African colonies. A paper on this subject was read before the Association by Mr. A. T. Hennessy, the chairman of the Automobile Club of South Africa. Mr. Hennessy went over the whole ground. Considering the conditions prevailing in South Africa, he dismissed the electric car with a wave of the hand. He devoted more time to the consideration of the virtues of the steam car, which he admitted to be great, but finally decided that the car with which the future development of South Africa was bound up was essentially the petrol car, as the climatic conditions were far from suitable, even to the improved steam vehicles, which he admits are such an enormous advance on the first specimens of that type of automobile with which South Africa became acquainted. Mr. Hennessy is in favour, owing to the high price of petrol in South Africa, of providing cars with two oil tanks, in one of which high grade petrol may be employed for starting, and the heavier fuel used for running after the cylinders have got hot. Mr. Hennessy concludes his paper as follows:—"No one who has any knowledge of the country can doubt that the future of the mechanically-propelled vehicle in South Africa is a great one, and that the engineer and manufacturer, who, at this early stage of motor development out here, takes up the question of designing and manufacturing vehicles suited for our roads, will reap a substantial harvest in the near future as a reward for their energy and foresight."

APPROPOS of the same subject, it is interesting to learn from the *African World* that there are 150 privately-owned cars in Johannesburg, ranging from 12-h.p. cars,

TOURIST TROPHY RACE.—The 14-h.p. James and Brown Car, which has a four-cylinder horizontal engine arranged beneath the frame under the driver's seat. Four speeds are provided and the rear wheels are driven by side chains. In the competition, the car was fitted with wire wheels in order to reduce the weight.

which is the usual power, up to the 30-h.p. vehicle belonging to Sir George Farrar.

THE Hon. Stephen Coleridge, to whose entertaining remarks, anent his conviction by the Andover extortionists, we recently referred, has withdrawn the notice of appeal which he had given. We must say we are sorry.

LONDONERS who have attempted to get on some of the motor 'buses running in London will sympathise with the objections of an Irishman to that form of conveyance, that "they go so fast that nobody can get into them, and moreover never stop for anyone to get out."

AUTOMOBILISTS will experience considerable satisfaction, mingled with a little amusement, at the proceedings of some of the enemies of the movement. A letter from a Mr. Horace Bleakley has appeared in several daily papers pointing out that the motorist's case is likely to be put with cogency and conviction before the Royal Commission on the Motor Car Acts, and calling upon all persons opposed to the movement to write *directly* (expressing their views) to the Chairman of the Commission, Lord Selby. Lord Selby is, no doubt, as everyone will admit, as impartial and judicially-minded a person as could possibly be met with, but if this advice is followed, as we hope it may be, he will find himself overwhelmed with a mass of letters, often probably quite incoherent, representing one side of the case, and an orderly, properly-marshalled statement of facts presented on the other side, and the effect upon his mind can hardly be doubtful. Anything better from the motorist's point of view can hardly be imagined. But Lord Selby has our sincerest sympathy in the tribulation in store for him should Mr. Horace Bleakley's proposal result in the deluge of letters he seems to anticipate.

CLARKSON STEAM OMNIBUS.—This is the first of the new double-decked Clarkson 'buses to be put into commission. The features of the new chassis were described in our issue of September 2nd.

Brockley Hill, Edgware.

Woodcock Hill, Barnet Lane.

Elstree Hill.

TESTING A MOTOR 'BUS.—Before taking delivery of motor omnibuses, most companies naturally stipulate for test runs. The above pictures were obtained on one of these occasions, on behalf of the Victoria Omnibus Company. The 'bus—one of the Swiss built Orion vehicles—started from the Company's garage in Carlton Vale, and was required to travel to Barnet by Brockley Hill, Elstree, and Barnet Lane, taking Woodcock Hill "en route." The journey was accomplished in 1½ hours without a stop, with a load of 24 people on board.

THE Kingston local authorities having failed, as is well known, to obtain the Local Government Board's sanction to the general imposition of a speed limit of 10 miles an hour throughout their dominions, have, as we have already chronicled, again come up to the charge with a demand that the speed of motor vehicles should be limited to 6 miles an hour in certain "tortuous" streets of the town. A second enquiry, under the presidency of Mr. F. J. Willis, one of the L.G.B. Inspectors, was accordingly held at the Kingston Town Hall last week. The usual arguments on behalf of local authorities were put forward, but the case which the Local Government Board will now proceed to decide, appeared to be an almost weaker one than usual. The following are a few of the most salient points of the evidence. One of the leading local witnesses, Dr. Richard Ackerley, of Surbiton, was of opinion that if such a regulation were introduced, the police, in a month or two, would be complaining that they could not regulate the traffic. Police-Inspector Bryce was prevailed upon to admit that a greater number of convictions were obtained under Section 1 of the Motor Car Act against driving to the common danger than under Section 9, for exceeding the specific speed limit, while the L.G.B. Inspector suggested (interrogatively) that the applicants for the speed limitation ought to prove that there were special dangers in the case in question which could not be met under Section 1 of the Act.

ANOTHER local enquiry into an application for a proposed limit of 10 miles was heard recently by Mr. Willis, on behalf of the Local Government Board, at Ealing, the Borough Council of which suburb desire to limit the speed of motor cars through their territory. One of the chief reasons for the application appears to have been that the Mayor of Ealing once or twice in getting out of a tramcar had received "shocks" from seeing motor vehicles approaching—a nice reason, it must be admitted. The local

inspector of police is apparently not in sympathy with the shocked mayor, and stated that only four motor car accidents had occurred in the space of 21 months.

THE autumn manoeuvres of the German Army, which are being carried out with almost more energy than usual this year, and which are, as usual, most carefully supervised by the Emperor in person, are taking place in a particularly difficult country for manoeuvring, the territory involved comprising both banks of the Rhine and the valleys of the Maine and Lahn.

THE Emperor, who acts as Umpire-in-Chief during most of the manoeuvres, is this year following the operations in a powerful motor car, which enables him to get about and keep in touch with the various forces in a way which would be quite impossible on horseback.

The Victoria Omnibus Company's 'Bus, built by the Orion Company. It is this vehicle which figures in our photographs above.

WILLIAM NEWMAN, a motor car driver, was recently sentenced at Slough to a fine of £3 for driving a motor car to the public danger at Eton. As he said he had no money to pay the fine with, he was sentenced to a month's hard labour.

THE Municipal Technical Institute of Belfast is, we are glad to learn, providing technical instruction for motor car drivers, and has arranged an extensive syllabus of lectures and practical demonstrations on the theory, construction and management of motors and motor vehicles.

M. MIGUEL ZAMACOIS has been amusing the readers of the *Gaulois* with a collection of automobile proverbs, which more or less read like a humorous adaptation of Ohlen-dorf to automobile conditions. The first of them is "tell me the price of your auto and I will tell you who you are," with others of the same kind, ending up with an invocation by foot-passengers to a passing automobilist, "*Morituri te salutant!*"

At the Dunlop Tyre Company's meeting last week, Mr. Harvey du Cros, the chairman, informed the shareholders that it was proposed to put up and equip two new buildings at a cost of £30,000 for the making of rubber, the development of the motor tyre trade, and a new branch of the trade, the making of motor omnibus tyres.

LAST week the motor garage of Claud Hamilton Limited, Aberdeen, was destroyed by fire. Fifteen cars were burned, the estimated damage being £8,000. Two of the cars belonged to Lady Gordon Cathcart, one of them having only arrived from London the previous day, for the use of Princess Christian, who was paying a visit to Cluny Castle.

APROPOS of some biographical reminiscences about Professor Ray Lankester and his Continental adventures, an evening paper mentions that "though the Professor once sat all night on the top of Vesuvius during an eruption, and was fired at by Sicilian brigands, the liveliest adventure in his life occurred in Piccadilly, and the worst brigand he ever met was a London magistrate.

A VERY fine example of the reliable running of the modern motor car is presented by the business tour which Mr. Basil Johnson is making with a 6-cylinder Napier through England and Scotland, on behalf of Messrs. S. F. Edge, Limited. The tour commenced on July 19th, and is still proceeding. Almost every day has seen a good mileage record, as much as 290 miles being covered on one occasion, and during the time that has elapsed since Mr. Basil Johnson started on July 19th, the car has covered a total of 4,511 miles, amounting to an average of $91\frac{1}{4}$ miles per day. The tour is having a good effect on the motor car industry, and it provides an eloquent object lesson in the reliability of up-to-date cars, as appointments have been made at various cross-country places days in advance, and the car has regularly turned up punctually.

TOURIST TROPHY RACE.—The 20-25-h.p. Crossley Car, which could not be got ready in time. This interesting vehicle differs considerably from the standard model, for it has a live-axle, three-speed gearbox, and leather cone clutch—features which were adopted to reduce weight. In a modified form, these vehicles will form one of the new Crossley models for next year.

THE London and South-Western Railway Company have extended their motor 'bus service by putting a new motor 'bus on the route between Farnham and Haslemere, a distance of twelve miles, running through Bourne, Hindhead, and Shotter Hill. The new vehicle, which has been built by Messrs. Thornycroft and Co., has a 24-h.p. motor, and is specially designed to tackle the severe hills of the route which it has to negotiate.

SEVERAL other new motor car services have already started, or will shortly be in regular working order, in different parts of the country. Amongst these is one between Leigh and Radleigh, in Essex, another is from Aberlady to North Berwick, by the North British Railway Company, who are employing Arrol-Johnston charabancs, whilst the Great Western Railway Company are starting their service of motor cars to-day between Abergavenny, Crickhowell, and Brecon for mails and passengers.

As we suggested last week, it now appears that the motor 'bus which was had up by the police on the Brighton road and charged with running at 32 miles an hour, was at the time going down Handcross Hill. So far, however, from waggling dangerously from side to side, as alleged by the police, according to one of the passengers who has now come forward and written to the Press, states that the running was remarkably smooth and steady. Perhaps it was the police who could not travel straight.

MR. ALDERMAN WHITLEY, of Sheffield, is a progressively-minded civic. At a recent meeting of the Corporation, he publicly regretted that the Bill enabling the Corporation to run motor omnibuses was being dropped, as he feared that some private company might get the powers. Motor omnibuses are, in his opinion, essential to connecting the various tramway routes, and present many advantages compared with electric trams.

THE popularity of the motor car continues to extend in Royal circles, and last week Princess Christian and Princess Victoria started on an extended motor car tour, passing through Barnstaple to Bath, where they remained for several days, and continuing the journey to Oxford.

A RECENT accident took place at Biggleswade, in which a little girl of eight was knocked down and killed by a mail cart. One of the witnesses—a medical man—called attention (none too soon) to the reckless manner in which children behave in the streets. The coroner observed that had the accident been due to a motor car much greater prominence would have been given to it, and added that, in his experience, only three fatal accidents had been caused by automobiles in the county of Bedford.

Mann's Patent Steam Cart and Wagon Company, Limited. Hunslet, Leeds.

Storage Batteries, &c. Hart Accumulator Company, Limited, Stratford.

NEW COMPANIES REGISTERED.

[Taking powers to manufacture or deal in motors, motor cars, or accessories, either as their principal or part of their objects.]

Commercial Cars (Limited), 79, Gracechurch Street, E.C.—Capital, £20,000 in £1 shares (10,000 7 per cent. cumulative preference). First directors, H. C. B. Underdown and H. G. Hutchinson.

Iris Cycle Company (Limited).—Capital, £100 in £1 shares. To carry on the business of manufacturers and vendors of cycles, motors, &c. The company contemplates certain dealings with the Premier Cycle Company (Limited).

Mid-Sussex Motor Company (Limited), Broadway, Hayward's Heath, Sussex.—Capital, £3,000 in £1 shares. Object, to acquire the business of motor omnibus and motor carriage proprietors, carried on by C. W. Wood, H. Finch, M. G. S. Pitcher, A. R. Pannett, G. R. Godley, and W. F. Comber, at Hayward's Heath, Sussex, as the Mid-Sussex Motor Syndicate. First directors, M. G. S. Pitcher (chairman), C. W. Wood, and G. R. Godley.

Yorkshire Mutual Garage (Limited), Brown's Chambers, Commercial Street, Leeds.—Capital, £10,000 in £1 shares.

East Kent and Herne Bay Motor Omnibus Company, Limited—Capital, £5,000 in £1 shares. First directors, H. E. Ramsey (chairman), N. Rowden, and A. G. Iggulden. Bank Chambers, High Street, Herne Bay, Kent.

BRITISH PATENT SPECIFICATIONS. Selected and Abridged by James D. Roots, M.I.Mech.E., Thanet House, Temple Bar, London.

The first date given is the date of application; the second, at the end, the date of the advertisement of the acceptance of the complete specification.

22504. 19th October, 1904. Improvements in Starting, Stopping, Speed-Controlling and Reversing Gear. Henry S. Hele-Shaw, F.R.S., Professor of Engineering, Liverpool University, Liverpool. In this type of gear there are two clutches and intervening epicyclic spur-gearing, the clutches having discs for their frictionally engaging surfaces; one of the two clutches, termed the coupling clutch, serves when required to directly connect together the driving and driven shafts, and the other clutch, termed the pinion clutch, serves when required to hold the pinions of the epicyclic gear against rotation. There are seven figures. Fig. 1 is a sectional elevation. The driving shaft, 1, is made hollow for a considerable part of its length, and the driven shaft, 2, enters the hollow part, 3, of the driving shaft, and is suitably bushed in a bush, 4, therein, thus ensuring absolute alignment of the two shafts. The casing, 5, which encloses the working parts in a bath of lubricant is divided into two parts by a transverse flanged joint, 6, and forms the outer and fixed member of the pinion clutch which controls the rotation of the pinion axes. The two shafts pass through the ends of the casing through bushes, 7, and the casing is

the flange, 14, of the inner member of the pinion clutch; the three presser pins, 17, which engage with the presser plate, 18, are elastically controlled by the springs, 19, carried in the spring boxes, 20. The pins, 17, pass through the ends of the spring boxes and the pins, 18, through bushes, 20; the opposite ends of each of the springs press on the collar of 17 and on the head of 18 respectively; the pins, 17, are screwed into the presser plate, 17. The part, 14, flange, 14, spring boxes, 20, bushes, 15, and a stiffening ring, 21, are preferably cast integral, the ring, 21, serving to support the ends of the pins, 15, and bind them and the spring boxes together; there are usually three spring boxes, 20, 120° apart, and three pinions between each pair of spring boxes. Each of the plates, A, has a series of internal teeth, a, which engage in featherways formed on the inner members of the respective clutches, and each of the plates, B, has a series of external teeth, b, which engage in the featherways, d, on the outer members. Each of the pinions, 16, engages with the wheels, 10 and 12. The axial movement of the inner member, 14, of the pinion clutch on the driving shaft is conveniently obtained by means of a forked lever, 22, and pivoted ring, 23, the latter working between guides provided with suitable ball races, 24. The 1 lever is operated by means of an operating 25, moving over a quadrant, 26.—August 30th,

3980. 18th August, 1904. Improvements in Internal Combustion Motors. Dugald

practically fluid-tight. The driven shaft, 2, has a flange, 8, to which is attached the outer member, 9, of the coupling clutch, and within the member, 9, is formed the internally toothed outer spur wheel, 10; opposite to 9 the inner member, 11, of the coupling clutch is formed on the driving shaft, 1, this member, 11, carrying the externally toothed inner spur wheel, 12. The outer member, 13, is formed on the inside of the casing, 5, and opposite this is the inner member, 14, of this clutch, which runs freely on the driving shaft, and carries the axes, 15, of the pinions, 16. Axial movement in the one direction causes engagement of the friction discs of the coupling clutch, and so directly connects the shafts together; whilst axial movement of this part in the opposite direction releases the discs, and causes the engagement of the friction discs of the pinion clutch, and so holds the pinion axes against rotation, with the result that the direction of rotation of the driven shaft is reversed; in the mid axial position of this part the friction discs of both clutches are free. The axes, 15, of the pinions are carried from the bosses, 15, formed on

Clerk, Little Woolpits, Ewhurst, Surrey; Henry N. Bickerton, and Henry W. Bradley, both of Wellington Works, Ashton-under-Lyne, Lancs. The object of this invention is to improve the rapidity of firing of the charge in an internal combustion motor, in which cooled exhaust products are added to the charge before compression. It consists in providing two or more igniters in the combustion chamber in such a way that the rate of inflammation of the charge is increased, and secondly in effecting the ignition by means of an igniter and a flame jet so arranged that the propagation of the inflammation of the charge takes place away from the added fluid, and does not tend to force mixture into the added fluid. There are two figures. Fig. 2 is a section of a portion of an engine with a device for projecting the flame into the forward part of the combustible mixture near the compressed exhaust gases. Simultaneously with the charging of the cylinder by the valve, 6, some combustible mixture is passed by a passage, 7, past a non-return valve, 8, and passage, 9, into the combustion chamber in order to fill the

passage, 9, with combustible mixture. A strong grating, 1, is situated between the valve and a sparking plug, 4, to prevent back firing and to prevent the temperature of the valve, 6, becoming too high. After the compression stroke of the piston, the mixture in the passage, 9, is fired by the igniter, 4, the flame produced being projected into the combustion chamber whereby the charge contained therein is ignited, inflammation taking place backwards. The valve, 6, may be controlled positively in any convenient manner or by a spring, 4, of such strength as to permit the valve to open under the charging pressure of the mixture supplied through passage, 9. The combustible may be supplied to the valve-controlled passage, 9, ignition being effected as before. The stippling, x, and the lines, y, represent respectively the combustible charge and the inert fluid after the compression stroke has been completed. The specification also describes and shows an arrangement in which two sparking plugs are placed in tandem in the combustion chamber to effect a more rapid ignition of the charge.—August 30th, 1905.

PASSING EVENTS.

Triumphant Development.

AFTER all the cry that has been made about the magnificence of the French industry, and the immense number of cars the French manufacturers are yearly turning out, it would appear that British manufacturers are not only now running their French rivals very close but are even beating them out of their best market, the United Kingdom. It is true that the opposite impression has hitherto prevailed, but it would seem that this is to a large extent a mistaken one, and based on the undoubted fact that the exports of British manufactured motor cars are negligible, while the imports are noteworthy. As usual, conclusions based on such data are unreliable, and it appears that the real reason why Great Britain imports motor cars, and practically does not export them, is that the demand for motor vehicles in the British Islands is so great, and the purchasing power of its population so considerable, that practically the whole of the home output is absorbed at home, while in addition a large import of foreign cars is needed to meet the requirements of the British market. A French daily contemporary—which has given its attention to the figures we recently gave on this subject—has sounded a note of warning—we might even say alarm to the French manufacturers. Considering the present position of the British industry and that we have been France's best customer, this is not surprising. The British public at present are credited with owning 32,000 motor cars, being an increase of 13,657 during the last 7 months. At one time the bulk of the English market was supplied by imports from abroad. Now English manufacturers are supplying the majority of the demands

made by customers in the British Islands. We are warranted in concluding that in a short time to come practically the whole of the requirements of the United Kingdom will be supplied by its own manufacturers. This is a most encouraging result. The British Empire Motor Trades Alliance, in a letter we have received drawing our attention to our French contemporary's article, appear to be in favour of protection. At any rate, they desire to "check the imports" and to "increase the exports." Protection is a vexed question on which we do not propose at present to enter, but if practically the whole output of British manufacturers is being taken by British customers the advantage of exports at the present moment is not apparent. The splendid growth to which we have referred above is at any rate evidence that even without protection the British motor car industry is now in a position in which it can most effectively hold its own.

What is the "Trophy"—the Tourist Trophy?

SOME interest attaches to the question of what the Tourist Trophy itself really is. Nobody in fact seems to know. Presumably there is a trophy, for have not some forty odd cars been racing in the Isle of Man to win it? One of them has won it, and should, in consequence, be in a position to carry it home in triumph. But what is it that the Arrol-Johnston Company will receive? Again we repeat, no one knows, and there is no one to whose eyes the elusive trophy has revealed itself in material form. The trophy which crowned the winner of the Olympic races of old was simply a garland of wild olive, but there is reason for supposing that the award which the winner of the most modern racing event has won is even more exiguous and impalpable. In fact there are doubts whether it has as yet really materialised. Perhaps it is merely a conception which will crystallise shortly into something artistic; but that some forty odd competitors should race round a long course with great verve and energy for a trophy, that at any rate at the time of the race, enjoyed, as far as we can ascertain, no actual existence, is a situation which possesses elements of comedy which should appeal to some of our humorists.

Is it fashioned of filigree golden?

Is it made of the vulgar tin?

A relic of ages olden

'Ere the motor car came in?

None know for none have beholden

That trophy all strove to win!

Recognising the Necessary.

It is an encouraging sign that borough and county surveyors are approaching the problem of rendering our roads properly suitable to modern traffic conditions, at least this is what may be gathered from the yearly reports of several of them which are now coming to hand. Quite a number, it must be admitted, of the surveyors still stoutly maintain that the motor car not only distributes but actually makes dust. We have contended against this misapprehension sufficiently often, but after all it does not greatly matter, as the surveyors seem more and more to be determined to grapple with the problem. They are almost unanimous that the dust-laying preparations, with some of which the public has become so familiar, merely act as palliatives. They do not, in most cases, produce any permanent effect, and require such frequently-renewed applications that the expense becomes equivalent to that involved in making up the road originally of

dust-diminishing materials. The general tendency seems to be more and more in favour of adopting these latter methods, *i.e.*, employing materials treated with tar for originally constructing the road surface. The question now, apparently, is merely one of initial expense. We say initial, as there is every reason to believe that though the original expense is greater the ultimate saving is likely to be such as to prevent the burdens of the rate-payers from being in any way increased, while the absence of dust annoyance, which is really hardly estimable in terms of cash, will be one of the benefits thrown in. Mr. Angell, the surveyor of the Beckenham Urban District Council, who has devoted considerable attention to the question, and who is entirely in favour of making up roads with tar-impregnated road metal, has got out some relative costs in regard to the principal materials. According to him, the expense of making up a road with flint saturated with tar amounts to 12s. 6d. per cubic yard, 17s. and 20s. being the figures for limestone and slag similarly treated. The question will have to be faced seriously. We believe it will be demonstrated before long, as we have suggested above, that the ultimate saving due to the use of what we may generically describe as tar-mac materials, will practically neutralise the increased original cost. In any case, it will be impossible to maintain the old conditions. They were far from ideal in summer weather even before the advent of the motor car, and only fossilized reactionaries can seriously propose to abolish the automobile rather than improve our roads. We are convinced that all that is needed is a sufficiency of pioneer experiments, and it is encouraging to find that the advisers of local authorities are making them.

The Climax of the Ludicrous.

To many motorists, the name of Chirk will recall the pleasantest recollections, for from the magnificent castle looking down through its glorious timber across the Shropshire plains to the Wrekin and the Longmynd, may be obtained one of the most glorious views in the British Islands. In future, however, probably no automobilist will ever hear the name of Chirk without laughing, for it is the contrast of the ridiculous with the sublime that provides the elements of the truly ludicrous, and such a contrast the deliberations (if such they can be called) of the Chirk Rural District Council certainly furnish when we recall the romantic scenery amid which they are held. Inspired by a communication from the "Highways Protection League" some of the members of the Chirk District Council have gone far towards immortalising themselves by anti-automobile mania. One of them, apparently a doctor by profession, to wit Dr. Lloyd, calmly stated that more people were killed by "ruthless motorists" than by any other section of the community, a statement which it is needless to point out is in flat and flagrant contradiction of statistics, and added the further entertaining proposal that everyone who drives a motor car should be insured to the tune of £2,000 against killing anybody. Finally, the Chirk medico reached the crowning height of absurdity by maintaining that even when it stood still a motor car was a danger! One somewhat more moderate councillor supported the insurance proposal, reducing, however, the amount of the insurance to £1,000. And then came the anti-climax! Councillor Parry, with funereal mien, slowly rose from his place, and, in solemn and sepulchral accents, declared, amid a solemn and portentous silence, that one of his *hens* had been killed by a motor car.

DUST TRIALS AT MAIDENHEAD.

ALTHOUGH the Automobile Club has devoted some attention to the abatement of the dust nuisance by conducting one or two trials of a semi-private character in the past, yet until last week it had not made any large

stretch of the Bath Road. Dust trials are essentially difficult events to carry through to a successful issue, for they are not altogether in the nature of a competition among cars. Even at the

MAIDENHEAD DUST TRIALS.—The Dennis experimental car fitted with boards to isolate the dust raised by the wheels from the effect of the draught under the car. Horizontal plates behind the wheels will also be noticed in the illustration.

which passed before the camera was notable for some distinctive features likely to have an influence on its behaviour in raising dust, there is no doubt that many

over the course, it was not easy to estimate small differences, although it soon became evident that certain cars might be classed as good, and others as bad, from

MAIDENHEAD DUST TRIALS.—An Argyll Car coming up the course.

valuable and instructive conclusions should be available. In the somewhat promiscuous selection of cars, each of which made four successive runs at different speeds

the "dusty" point of view. Speed in itself made a very great difference, but a car which was better at one speed appeared to be better at other speeds also.

MAIDENHEAD DUST TRIALS.—Mr. Wellington's Spyker going over the course. The view on the right was taken after the front mud-guards had been removed.

Mr. C. R. de la Salle's 18-h.p. Siddeley.

A passing tourist car, not taking part in the trials.

MAIDENHEAD DUST TRIALS.

Although it was understood that a novel invention which "lays all the dust which may be raised by the car fitted with it" would be tried, this apparatus failed to materialise, and the only special car was one sent by Messrs. Dennis Bros. This car was fitted with long boards fastened to both sides of the frame, and reaching nearly to the ground. The boards extended for the full length of the car, and thus isolated the space between the wheels from the wheels themselves. No advantage was apparent from this admittedly impractical type of construction; the underpart of the car was comparatively open, and it was difficult to judge what effect the boards had on the dust raised by the front wheels, for, as they were shod with narrow-tread Collier tyres, they raised very little. In addition to the side boards, the Dennis car also had small horizontal plates—which are visible in our illustration—fitted behind each wheel, but these did not seem to prevent the dust from spreading.

Among the least dusty of all the cars present were Mr. Wilson's 15-20-h.p. Spyker, Mr. F. Wellington's 15-20-h.p. Spyker, and Mr. R. C. H. Harrison's 12-h.p. Sunbeam. All these cars were noticeable for their high open build. The Spyker cars are of the live-axle type, and on the Sunbeam car the side-chains were enclosed in cases providing the well known "little oil bath." Mr. Wilson's Spyker car—on which it was our pleasure, through Mr. Wilson's courtesy, to journey down to the meeting—will be remembered as the "dustless" car of the British Automobile Commercial Syndicate's dust trials at Luton—which we described in our issue of July 22nd, 1905—and during the run we had another

opportunity for taking note of the particularly dustless character of these vehicles—a feature mainly due to the height of the machinery from the ground, and to the efficient manner in which the mechanism is encased on these quiet, smooth-running vehicles. The only difference between this car and Mr. F. Wellington's car was the presence of non-skid bands on the rear wheels of the former; thus fitted, Mr. Wilson's car seemed the less dusty of the two.

As a final test, the judges asked Mr. Wellington to remove the front mud-guards from his car, and under this condition there was a noticeable improvement in its performance. The front mud-guards were not in this case fitted with "flaps," so the improvement is the more remarkable, and one of the useful points taught, therefore, by these trials is that motorists would do well to make a practice of fastening the flaps of their mud-guards up to the step on dusty days in order to eliminate, as far as possible, their disturbing influence.

It is, of course, in the construction of suitable roads that the ultimate solution of the dust problem will be found. Meanwhile, every effort towards improving the dustless qualities of cars is most commendable, and one of the surest ways of doing this is by drawing attention to the differences which exist between standard makes of vehicles. It is the one blemish on a good car that it may, even while being driven considerably, cause annoyance to others by the dust it raises, and the determined efforts of everyone connected with the industry and sport to reduce this nuisance will do more than anything to suppress hostile feeling towards the automobile movement.

MAIDENHEAD DUST TRIALS.—The cars waiting their turn in Maidenhead Thicket.

A 1906 MERCEDES CAR.—THE NEW 70-H.P. MODEL.—PART

SOME STARTLING MINOR DEPARTURES.

EVERYONE is naturally very keen on knowing, at the earliest possible moment, what new features are being introduced by the largest makers on their latest vehicles. This being so—and being particularly so when Mercedes cars are in question—it is with great pleasure that we now give the following illustrated description of next year's 70-h.p. Mercedes model. The first chassis of the kind has quite recently arrived from the celebrated Cannstatt factory to the order of Mr. Harvey Du Cros, junr., to whom we are indebted for the opportunity that has been afforded us, at the London premises of the Ariel Motor Company, of making a thorough examination of it, and of taking the accompanying photographs. This 1906 model has been constructed to take the place of the well-known 60-h.p. vehicles, so that no more of that famous type of car are to be built in future.

In many important respects, startling departures have been made from previous practice, and consequently this chassis cannot fail to attract a considerable amount of attention. First and foremost, one instinctively refers to the gear-box, though possibly even more strikingly novel is the carburettor, for the gear-box to a certain extent resembles the design which was first introduced by the Mors Company, but there is only a very remote similarity between the new carburettor, and any other type of multiple-jet carburettor with which we are acquainted. Not only does the "gear" give a "direct-through-drive" on the top speed, but there is a second pair of bevel wheels for transmitting the power from the lay-shaft to the differential

counter-shaft, and the size of the gear-box has been reduced as much as possible. On the earlier 70-h.p. cars, which were built at the end of last year, and were described in our issues of December 24th, 1904, and February 4th, 1905, it will be remembered that separate casings enclosed the change-speed-gear and the differential with its bevels. Now, however, all these parts are contained in a single gear-box. Other novel characteristics are also possessed by the transmission-gear, all of which will be dealt with in due course.

Briefly enumerating, before actually describing, the other chief departures that have been introduced on this chassis, a few words should be said about the carburettor, and attention should be drawn to (1) the method adopted for fixing the springs to the axles; (2) the means that are provided for adjusting the foot-operated brake-bands; (3) the modified construction of the main-clutch casing; and (4) the pressure-feed

device for refilling the hand-operated lubricator. The carburettor has no less than four spray-jets, one of which is solely used when the engine is running "light," while the other three are brought into operation successively as the throttle-valve is opened wider and wider. Another noticeable point is that no attempt is made to warm, or to dry, the air that is drawn into the carburettor, the only heating device being a water-jacket that surrounds the four adjacent mixing-chambers. Mention, too, should be made of the fact that there is no "auxiliary-air" supply of any kind, and that there is a special mechanism fitted to the car by which the flow of petrol, both to and from the float-feed-chamber, can be entirely cut off by a lever on the dash-board.

In the main, the chassis does not differ materially from those of the same make which are already so familiar to readers of THE AUTOMOTOR JOURNAL, and—as our illustrations will show—its general appearance immediately stamps it as being a Mercedes. The engine is similar to that on the previous 70-h.p. model, with its gear-wheels enclosed in a neat casing in front, and with ball-bearings for the crank-shaft where that shaft is carried by three bearings in the crank-chamber.

The wheel-base is 11 ft. 1½ ins., the track is 5 ft. and 4 ft. 10½ ins. In front, the wheels are shod with 910 by 100 mm. Continentals, and the tyres on the driving wheels are 920 by 125 mm.

Our Illustrations.

For the convenience of those who wish to obtain a good general idea of this chassis by merely turning

their attention to our illustrations, the following brief references will be found useful:—

The front view, given in Fig. 1, shows the steering-heads, the front axle with the connecting rod behind it, the catch, G, for holding the starting-handle, and the spring-boxes, F, for fixing the springs to the axle.

Fig. 2 is a view from above the gear-box, the upper portion of which has been removed to show the interior.

In Fig. 3, one end of the rear-axle is prominent, and the method of securing the spring in place, above it is particularly clearly demonstrated. In this view, a good idea is also obtained of the radius-rod and the hub-brake.

Fig. 4 shows the carburettor with its throttle-valve and the induction-pipes. These parts are first seen assembled together, and are afterwards shown dismantled sufficiently to render clear their individual construction.

Figs. 5, 6, and 7, are three radically different views of the complete chassis. Together, they enable the position

Fig. 1.—Front view of the 1906, 70-h.p. Mercedes Chassis, showing the method of fixing the springs, and the catch for holding the starting-handle vertical.

when moved forward or backward; the rod C^3 causes the spur-wheels C^2 and C^1 to slide into mesh with their respective wheels B^2 or B^1 for similarly giving the second or the first speed; and the rod D^1 serves the simple duty of sliding the intermediate spur-wheel D into common mesh with the wheels B^1 and C^1 , to give the "reverse."

One new feature of the transmission mechanism is that the ends of the differential countershaft have long plain bearings, instead of ball bearings, fixed beneath the side members of the frame. At the extreme outer end of these plain bearings there is, however, a row of balls quite close up to the large chain-sprockets.

The Side Springs.

All four springs are fitted centrally with special "boxes" that are in turn secured to the axle by

a single nut. The arrangement adopted is visible in Fig. 1, and—*even more clearly*—in Fig. 3. The spring box, F , fits down upon a slightly recessed face above the axle, which is at this point sufficiently stiffened up to allow the single bolt to pass through it. The spring is thus held in place by the single nut, F , beneath the axle.

The New Carburettor

In Fig. 4, the float-feed chamber, H , is easily recognisable by its shape. The top of the ordinary central needle, H^1 , which automatically cuts off the fuel supply and thus maintains a constant level inside the chamber, will also be readily distinguished. To the right of the needle, H^1 , there is, however, another needle, H^2 , which is of a somewhat similar form, though it is normally held up by the weak external spring that surrounds its upper

Fig. 2.—The new Mercedes change-speed-gear, fitted to the 1906 70-h.p. chassis. View from above, showing the entire mechanism.

and shape of every important part of the mechanism to be seen. And, finally, Figs. 8 and 9 show the engine—from both sides—fixed in place in the chassis.

The Change-Speed-Gear.

Referring more particularly to Fig. 2—but useful views of the complete gear-box will also be found in Figs. 6 and 7—it will be observed that the gear-box is made in two parts, and that ball-bearings are employed throughout. The lower half is fixed by two brackets to the side members of the pressed-steel frame, and by two special bolts to the cross-member behind it. In the upper portion, an easily removable lid is fitted above the sliding wheels on the shaft, C , this lid being merely held down in place by four spring catches (see Fig. 7), but being rendered oil-tight by rubber packing.

The unusual features of the gear are that the rear end of the driving-shaft, C , is partly supported by the bridge, A^1 , which spans the differential-countershaft, and that the two bevel-pinions, A and B , are both capable of driving the differential-gear. The pinion, B , serves to drive the car when either of the sliding spur-wheels, C^1 , C^2 , or A^3 are brought into mesh with their corresponding wheels, B^1 , B^2 , and B^3 , and it is, therefore, employed for the 1st, 2nd, or 3rd speed, respectively. For the 4th speed, however, the wheel, A^3 , engages with the internally-toothed gear-wheel, A^2 , which is solid with the bevel-pinion, A , and hence the lay-shaft then merely revolves idly and a direct drive is established between the shaft, C , and the pinion, A . Normally, of course, the wheels, A and A^2 , revolve idly about the shaft, C .

The gear is operated in the well known manner by a single hand-lever, which can be moved forwards or backwards in either of the alternative slots in its quadrant, and by the three rods A^4 , C^3 and D^1 . The rod A^4 merely controls the single wheel A^3 to give the third or the fourth speed,

Fig. 3.—One end of the rear-axle on the new 70-h.p. Mercedes Car. This illustration shows the manner in which the side springs are fixed to the axles.

Fig. 4.—The novel type of carburettor, which is employed on the 1908, 70-h.p. Mercedes model. On the left, it is shown complete with its throttle-valve and the branched induction-pipe. To the right, the Float-Feed-Chamber with the four Jets, the Throttle-Valve-Casing with its four-fold Mixing-Chamber, and the moving member of the Throttle-Valve are each seen separately.

projecting end. This needle, H^2 , controls the flow of the petrol from the chamber, H , to the jets, J , M , L , and K , and can be forced downward (to cut off the feed) by the cam-disk, H^3 , which also simultaneously presses the needle, H^1 , down upon its seat. The disk, H^3 , is connected up to a small hand-lever (H^4 , Fig. 7) on the dashboard, and thus the driver can, at a moment's notice, interrupt the fuel-feed to and from the carburettor.

The four jets are all arranged in such a way as to receive an equal feed of petrol, but the size and number of the holes in them varies considerably. Thus the jet, J , has but two small holes drilled through its wall, whereas the jet, K , has four large holes and the other jets have two holes each. The jets are closed at their upper ends, and the petrol only passes out radially.

The mixing-chamber, N , which forms the lower portion of the throttle-valve, and is solid with the branched induction-pipe, is divided off vertically into four entirely distinct compartments—one above each jet—and each compartment terminates at its upper end in the cylindrical throttle-valve casing. The entire chamber, N , has a water-jacket, fed by pipes that are connected to the unions, N^1 , and its four compartments are all quite open to the atmosphere beneath. At their upper ends, the four compartments form the ports, J^1 (a mere slit), M^1 , L^1 , and K^1 , which are covered and uncovered as required by the rocking inner member of the throttle-valve—a view of which member is given on the extreme right in Fig. 4.

Surrounding the jet, J , the mixing-chamber passage is

Justice (?) by the "Great Unpaid."—There is one point about the policemen who manage those "measured furlongs" which the profane have come to designate as police traps. They are imbued with a splendid impartiality as regards the victims whom they hale before the magistrates. Wealth we have long known has no effect on the question. Rank and eminence counts for next to nothing. Even the Duke of Fife and the Prime Minister have fallen victims. Now it appears to be the turn of our *littérateurs*. A few weeks ago, the Hamp-

small in diameter, but around the other three jets the passages are of considerable area. A very considerable injection action is, therefore, obtained when the jet, J , alone is in operation, and thus ample carburation can be maintained even though the volume of air drawn into the engine is reduced to a minimum. The action of the throttle-valve, when first slightly opened, is to bring the curiously-shaped port, J^2 (in the moving member), opposite to the slit, J^1 , before any of the ports, K^1 , L^1 , or M^1 , are uncovered. When the engine is running quite light, the required amount of mixture can then be obtained to a nicety merely by altering the relative position of the port, J^2 , and the slit, J^1 .

For giving more power, the throttle-valve is moved further in the same direction and then the V-shaped edge, K^2 , of the moving member begins to uncover the port, K^1 —bringing the jet, K , into operation—simultaneously as the port, J^2 , gradually reduces the feed through the slit, J^1 . Further movement opens the port, K^1 , fully, and then commences to open the port, L^1 , while finally, after that port is wide open, the port, M^1 , becomes uncovered. Jet after jet is thus successively brought into action until, whereas at first the small jet, J , was alone in operation, all the three large jets, K , L , and M , are supplying petrol to the engine.

All the air required by the engine enters direct from the atmosphere at the bottom of the mixing-chamber, N , coming up around the metal dish that is seen in place beneath the jet-fitting.

(To be continued.)

shire police caught a Tartar in the Hon. Stephen Coleridge. Now a similar (probably unpleasant) capture has fallen into their net in the shape of Sir Arthur Conan Doyle. Needless to say, having a powerful pen, he has retaliated in the columns of the daily press, and has given the whole system a satisfactory wiggling. But what a farce the whole thing is. The two most recent and most notorious captures are two of the most humane and considerate men in the country and the most unlikely to ever drive to the danger of the public.

AN 18-H.P. WHITE STEAM CAR—THE 1906 MODEL.

Fig. 1.—View of the 1906 White Chassis, from the "near" side, with the bonnet removed.

EXCELLENT in every way as is this year's 15-h.p. model, the manufacturers of the White steam cars have again—true to tradition—succeeded in showing the motoring public that they—although practically alone and unassisted in the development of a distinct type of vehicle—can fully hold their own with steam vehicles in competition with the combined efforts of the numerous builders of petrol cars. Their new model has each year been a sure sign of the restless activity of this most progressive firm. Good as was even their first two-seated runabout—astonishingly good in comparison with motor cars of that day—yet each and every new type has been far better, and the latest is no exception to this now well-recognised rule.

It naturally takes some time for motorists, or would-be purchasers, to overcome the suspicion—and even the prejudice—that they entertain against any unorthodox type of car, and it is hardly to be wondered at if they fight shy of those which work upon a totally different principle to the cars that are owned by their friends. This being so, it is nothing short of remarkable that

such a large number of White steam cars should have been sold in this country, and, if any real proof were still needed to convince the sceptic of their great merits, no more positive evidence than this could well be offered. As it is, however, even the most ardent advocate of, and adherent to, the petrol car is now compelled to have a good word for the "White," and even the driver who prides himself upon the speed of his 30-40-h.p. petrol vehicle knows that a "White" can travel too. This year's model gives luxury, speed, and is a first-rate hill-climber, but in each of these respects that which has now been brought out for 1906 is even superior. It is, in fact, unquestionably destined to popularise "steamers" amongst those who make a point of buying the very best cars.

Curiously enough, in view of its greatly improved appearance, less change has been made in the mechanism this time than during any previous year. This is not only striking as a fact, however, for it has a very real significance as well. It shows that the gradual process of development, which is inseparable

Fig. 3.—View—looking down from above—of the 18-h.p. White Chassis.

Fig. 2.—The new 18-h.p. White Chassis, as seen from the "off" side, showing the modified arrangement of the flue which now leads the products of combustion out beneath at the back.

from all new inventions, has now been completed, and that a satisfactory solution of any minor weaknesses, or original difficulties, has been arrived at. Another interesting point that is brought home by a first glance at the new chassis, is that it might now be easily mistaken for that of a petrol vehicle. Were it not for the centrally-placed generator—which is obviously too big for a petrol tank—and for the absence of a gear-box between the engine and the rear-axle-casing, the casual observer might easily be excused such a mistake.

The most striking difference in the new model is that it has a side-entrance body, and that the chassis no longer offers any restrictions to the shape of the body. This very important result has been attained by substituting a "down" flue for the "side" flues hitherto employed, the hot gases from the generator being now conducted down again, around outside the generator, whence they are finally led away to the atmosphere from beneath the body at the rear. Naturally, moreover, the length of the chassis has been increased considerably to take full advantage of this novel disposition of the flues, and

the net upshot of this new arrangement is that one of the most comfortable, and easy riding, vehicles on the market has been produced. The wheel-base is 9 ft. 6 ins., instead of 7 ft. 6 ins., the track is still 4 ft. 8 ins., the springs are once more increased in length, and the wheels are shod with 870 by 100 mm. tyres.

Our first illustration shows one of these cars fitted with an American, Limousine body, and this photograph gives a fairly good idea of the handsome appearance of the new cars. For the English market, however, the finest and best-finished class of bodywork that can be obtained in *this* country is being adopted, and great care has been taken in this respect. A very artistic design has been chosen, and every endeavour has been made to render the car a veritable carriage *de-luxe*.

In our other illustrations the chassis is shown from four different points of view. These taken in conjunction with one another giving an excellent idea of the general construction. In Figs. 1 and 2, it is seen from either side, while Fig. 3 and 4 are views from above and

Fig. 4.—The 1906 White Chassis, as seen from beneath; in this view the simple nature of the transmission mechanism is clearly demonstrated.

beneath respectively. Subscribers to this JOURNAL who file their back numbers, and can therefore look up the full description which we gave of the 15 h.-p. model in our issues of 10th and 17th December last, will find it interesting to compare the illustrations then given of the 1905 car with those photographs that we now reproduce. That previous description is also in very large measure applicable to the new model, and we might further remind our readers that we had before that time dealt in no small detail with the White steam system, both from the constructional point of view, and from that of a driver; the last mentioned article, entitled "A Successful Steam Touring Car, and the Reasons of Its Success," was published on 20th and 27th August last year, and was written after we had had some personal experience in driving one of these cars for a time ourselves.

Dealing now with the other novel features that have been embodied, they may, for the most part, be summed up in three short sentences: Everything is stronger. More power is available. Greater all-round efficiency has been attained. There is, however, an important alteration in the burner, to which most of the air has hitherto found access from beneath. It is now closed in entirely, and all the air that is required by it enters through the induction tube around the fuel-jet. As a result, the openings through which the combustible mixture passes from the burner itself are larger than they have been formerly, and one advantage is that the fire is even less likely to be influenced by disturbing atmospheric influences (in rough weather) than before.

To mention just a few small details that add to the capabilities of the car, and largely account for the greater power that is available, attention might be directed to the larger vaporiser, the stronger engine, the shorter radius-rods, the compensated side brakes, the heavier transmission mechanism, and the improved steering-gear. Useful modifications have also been made in the lubricating system, and in the way of fitting the engine with shields to reduce loss of heat by radiation from the cylinders, while those who are well acquainted with the 15-h.p. model will recognise—even from our illustrations—that the valve-gear above the cylinders, for admitting high-pressure steam to the low-pressure cylinder when starting, is considerably more substantial on this new car.

This 18-h.p. car is, naturally enough, somewhat heavier (by about 500 lbs.) than the 15-h.p. model, and it might at first be supposed—since the cylinders are no larger—

that it would cease to be as fast or as economical in water and in fuel as the earlier vehicle. It is useful, however, to remember that even on the 10-h.p. car, which was the predecessor of the 15-h.p. model, the same-

sized engine was employed, and everyone is now aware of the great superiority of the latter over the former in all respects. Similarly, we understand—though we have not as yet had an opportunity of witnessing it personally—the 18-h.p. car can easily "leave" the 15-h.p. on the road or up steep hills, while its greater length has proved to be anything but a drawback in respect of "manœuvrability."

The 18-h.p. "White" Steam Car, fitted with an American Limousine body.

It must not be supposed that there are but few very real and very far-reaching improvements in the chassis, for such is anything but the case. The truth is that they are numerous, and we understand that their combined effect is most remarkable. Each alone, however, would but appear trivial if merely described individually in this article, and we therefore postpone any full treatment of such constructional details until we have made ourselves thoroughly acquainted with their merits in actual practice on the road.

The actual system remains unchanged, and all the good points of the 15-h.p. car—the double feed-water pump, the free engine, the steadying fly-wheel, the fan-cooled radiator, and the "emergency" alternative-ratio gear—are retained on this larger vehicle. Neither is there any important modification in the steam system itself, the essential features of which are the specially-constructed "flash" generator, the automatic fuel and water devices, controlled by temperature and pressure respectively, the double-acting compound engine, with its ball-bearings, and the constantly running feed-pumps.

From what has already been said, it will have been gathered that this most successful type of steam car has again undergone considerable improvement, and that there is every probability of its becoming even more generally known and appreciated than it has been hitherto. Steam cars doubtless have been somewhat "under a cloud" since those of the light American type ceased to find a market, but the makers of the "White" have always succeeded in preventing steam cars, as an entire class, from being relegated to past history, and this has been a task that could only have been performed by those building and supplying an exceptionally and consistently good vehicle. The 1906 model will certainly have an even more marked an effect in this direction.

In order to accommodate the additional staff required to deal with the evidence which is in preparation for the Royal Commission on Motor Traffic, premises have been

taken by the Joint Committee of the Automobile Club and Motor Union in Albemarle House, at the corner of Albemarle Street and Piccadilly.

REPAIRING A PUNCTURE—A MODERN METHOD.

(Continued)

The Process.

FOR the purpose of illustrating a typical case, we have taken as an object for repair, a tyre which has an oval-shaped hole in it measuring about half an inch wide and three-quarters of an inch long (Fig. 4). Alongside it is the same tyre after repair, while Figs. 5 and 6 show views of the repair from the side and from behind respectively. In order to make a neat mend, it is necessary to bevel the edges of the hole so that the compound may obtain a firm hold and yet not make a clumsy patch. This bevelling is most easily done with a

the actual repair may be commenced, but there is one thing to do first—place a piece of paper on the other side of the hole (Fig. 10). This little point is quite likely to be forgotten until too late, but it is not likely to be omitted more than once if the compound sticks to the opposite wall of the tyre. The method of applying

Fig. 6.—A view of the repair from the inside of the tyre, showing how the compound fills the hole. The somewhat peculiar cracked appearance of the repair in this view is due to the adhesion of the paper which had to be inserted in the tyre to prevent the compound sticking to the opposite wall of the tyre.

the compound is shown in Fig. 11, the strip being pressed firmly on to the tyre and worked round so as to gradually diminish the size of the hole, until it is finally filled up altogether. The amount of compound pressed into position in this way should only be just sufficient to

Fig. 4.—The damaged tyre before and after repair.

pair of scissors (Fig. 7), as anyone who is acquainted with the difficulties of cutting rubber with a knife will readily understand. After the edges have been bevelled their surface should be well rasped (Fig. 8) until, for some distance all round the hole, there is a perfectly clean surface. The next operation (Fig. 9) is to prepare this surface with cement in exactly the same way as a patch is prepared with rubber solution, and while the cement is drying to a "tacky" condition, some strips of compound should be cut off and made ready for use.

Fig. 5.—Side view of the repair, showing that it can be made flush with the original rubber.

The compound is provided in a roll about three or four inches wide, and either that which is yellow-brown or that which is red in colour may be used, the only difference being that one is drugged with sulphur and the other with antimony. Strips of the compound about $\frac{1}{4}$ -inch wide must be cut from the roll, and only one or two such strips will be necessary for repairing a hole of the size mentioned. To render the strips somewhat more plastic they should be placed on the top of the vulcaniser—which by this time will have become heated—and warmed for a few seconds. When the damaged tyre is "tacky," and the compound is also ready for use,

Fig. 7.—REPAIRING A TYRE.—First bevel the edges of the hole with a pair of scissors.

come flush with the tyre at the top edge of the bevel, care being taken to see that the edges of the adjacent rings of compound always overlap.

The repair at this early stage will present a somewhat rough appearance, and before proceeding with the vul-

Fig. 8.—Then well rasp the bevelled surface.

canisation it is necessary to smooth down the surface, and "caulk" the edges of the compound. This is best done with a penknife, as shown in Fig. 12. If after this is done the compound still bulges above the level of the tyre it should be pared down flush with a knife.

(To be concluded.)

THE MANOGRAPH—ITS UTILITY AND CONSTRUCTION.—PART III.

THE pin, C^9 , is caused to move backwards and forwards, against the action of the spring, C^{10} , by the pivoted lever, C^8 , upon one end of which it rests, and this lever, C^8 , is connected by a short link (as seen in Figs. 2 and 3) with a crank-pin that projects from the spur-wheel, C^7 . The crank-pin has a very short throw, being only slightly eccentric to the wheel, C^7 , and the length of the connecting-link bears the same proportion to the throw of the crank-pin that the length of an ordinary connecting-rod does to the throw of the crank-shaft on an average petrol engine. The result is that if the wheel, C^7 , revolves in unison with the crank-shaft of the engine, the pin, C^9 , is compelled to move backwards and forwards

in synchronism with the engine-piston, thus causing the beam of light to follow suit on the screen.

The spur-wheel, C^7 , is driven by the flexible-shaft, C , but is not directly connected with it, since it would be difficult—even when the engines were at rest—to attach the flexible shaft to the crank-shaft in precisely the correct position. It is obviously necessary that the beam of light should arrive at each end of its range of travel across the screen, at exactly the same instants that the piston completes its inward and outward strokes, and it is also very convenient to be able to connect and disconnect the flexible shaft while the engine is running. The spur-wheel, C^7 , is therefore mounted centrally in a metal

The thick horizontal line on the left represents the piston-travel when a very long connecting-rod is employed, and the corresponding thick line to the right of it represents the piston-travel with a short connecting-rod, while, on the extreme right, the circle denotes the path of the crank-pin about the axis of the crank-shaft. The former horizontal line is divided into eight equal parts by the thick vertical lines above it, so that the distance between each of these represents one-eighth of the travel of the piston. Precisely corresponding, but thinner vertical lines, are drawn beneath this horizontal line, and also above and beneath the other horizontal line, but alongside these thin lines will be seen the thick vertical lines, $1a, 2a, \&c., 1b, 2b, \&c.,$ and $1c, 2c, \&c.$ The positions of the intermediate thick lines, just referred to, show the extent to which the obliquity of the longer connecting-rod, and the difference of obliquity between it and the shorter rod might affect the indicator diagram.

Superimposed upon the vertical lines in each case, is a diagram such as would be obtained from a petrol engine when running with the throttle-valve wide open, and with the ignition fully retarded. The variations in shape of these four diagrams demonstrate the effect of connecting-rod obliquity in each of the cases represented, for otherwise they would be identical. The first diagram is assumed to be correctly "drawn," but the one immediately beneath it (which is superimposed above the lines, $1a, 2a, \&c.$) is such as would be produced if the diagram were thrown on the screen of the manograph the wrong way round. In this case, the changes in pressure represented by it occur at points during the stroke that can be correctly determined by means of the unequally-spaced

thick lines, but the diagram would be extremely misleading if read in the usual way in the light of the equally-spaced lines $1, 2, 3, \&c.$ The cause for this is easy to see from the drawing. It shows that the piston arrives at mid-stroke (4) before the crank-pin completes a quarter revolution, that the maximum piston-speed is reached slightly after it has travelled half-way, and that the piston-speed varies more rapidly during the second portion of its stroke.

In the upper diagram on the right, a similar kind of distortion has been brought about by the difference in length of the two connecting-rods, and this diagram, therefore, demonstrates our second point. Only by reading it in relationship to the unequally-spaced thick lines ($1b, 2b, \&c.$)—and not in the usual way by the equally-spaced thin lines—could correct deductions be made from it. In this case also, our drawing shows the reason for this distortion.

The remaining diagram (the lower one to the right) shows the extent to which distortion is produced from both the causes mentioned above in combination with one another, and here it will be seen how extremely easy it is for misleading deductions to be made from improperly taken records. At first sight, for instance, it might well be assumed that ignition occurred when the piston had traversed three-sixteenths of its forward stroke, for this is what is shown by ordinary measurement, the rise in pressure occurring about midway between the lines 1 and 2. As a matter of fact, however, on closer inspection, it will be seen that ignition occurred slightly after the line, $2c$, or, in other words, that the rise in pressure took place considerably later—roughly speaking when the piston had completed one-fourth of its stroke.

drum, C⁴, which can be rotated, about its axis, inside the casting, A¹, and it is driven by another equal-sized spur-wheel, C⁵, that is fitted eccentrically to the drum, C⁴. The spindle, C⁶, carrying the wheel, C⁵, passes through the drum, C⁴, and it is this spindle to which the flexible shaft is connected. For convenience, there is a detachable plate, C⁷, that forms a part of the shaft-coupling, C⁸, the stationary external casting on that shaft being secured to it by a union nut; the "live" shaft engages, jaw-clutch fashion, with the spindle, C⁶. At any time, the drum, C⁴ can be rotated by hand, this being provided for by the adjustment screw, C¹², which has a worm formed on it to mesh with corresponding teeth formed around the periphery of the drum. It is immaterial, therefore, how the flexible shaft is initially coupled up to the crankshaft, for the manograph can subsequently be brought into synchronism with the engine by operating the adjustment screw, C¹². In practice, it is easy to do this accurately when the instrument is in use, by retarding the ignition and watching the shape of the diagram. The completion of the compression stroke can then be recognised on the screen, and if it does not occur at the right place, it can be made to do so.

Various diaphragms, B², are obtainable from the manufacturers, to suit different pressures and engines of different kinds, and, with each of these, are supplied data giving the relationship between vertical deflections of the beam of light and pressures on the diaphragm. These data enable any diagrams that are obtained to be re-drawn accurately for the purposes of calculating indicated horsepower, when required, but are primarily intended to permit the records to be measured for pressure.

In concluding this article, there are one or two further points that may to advantage be mentioned briefly, as being likely to prove useful to users of the manograph. A glance at the diagrammatic sketches which we give in Fig. 5 will show that a more accurate diagram will be

obtained if the instrument is set to give the high part of the diagram on the left side, instead of the right, of the ground-glass screen. This is so because it is only under these circumstances that the obliquity of the connecting-rod in the engine is compensated for by that of the connecting-link in the manograph. Otherwise, there would be the same kind of slight distortion that results if the relative length of connecting-link to crank-throw does not correspond with the relative length of connecting-rod to crank-throw in the engine; Fig. 5 also demonstrates this point. The entire instrument which is very carefully constructed and is thoroughly well finished, has adjustments provided by which the mirror can be properly illuminated at its centre, and by which the beam of light can be thrown upon the correct spot on the ground glass; a certain amount of care is therefore required in the first place to see that everything is "set" as it should be, or otherwise inferior results can only be expected. It is, in addition, necessary to remove and clean the diaphragm after it has been used, for otherwise the products of combustion, and the condensed gases that form as moisture on its surface, are liable to cause oxidation to occur.

Table of Reference Letters for the Manograph Illustrations.

A	Wooden case.	C ⁴	Circular "timing" drum.
A ¹	Brass casting containing moving parts.	C ⁵	Shaft driven by C.
A ²	Lamp fitting.	C ⁶	Spur-wheel on C ⁴ .
A ³	Ground-glass screen.	C ⁷	Spur-wheel, driven by C ⁵ .
B	Tube leading from combustion-chamber.	C ⁸	Oscillating lever.
B ¹	Screw-plug, holding diaphragm in place.	C ⁹	Plunger-pin operated by C ⁸ .
B ²	Diaphragm.	C ¹⁰	Spring acting against C ⁹ .
B ³	Plunger-pin for same.	C ¹¹	Mirror-arm operated by C ⁹ .
B ⁴	Spring acting against B ² .	C ¹²	Adjustment worm for "timing" drum, C ⁴ .
B ⁵	Pressure-operated mirror-arm.	D	Mirror.
C	Flexible shaft.	D ¹	Fulcrum centre.
C ¹	Engine-coupling on same.	D ²	Fixed fulcrum-pin.
C ²	Coupling to instrument.	E	Acetylene gas pipe.
C ³	Detachable plate for C ² .	F	Chimney.
		F ¹	Prism.

Tyre Deterioration.—Mr. S. F. Edge, who is ever on the alert to discover popular errors in motor car management, writes pointing out the very great variation in the lives of similar tyres on similar vehicles belonging to different owners, and he has come to the conclusion that of the numerous methods of improper usage, the most frequent is incorrect inflation. Load on each wheel and size of tyres naturally determine the actual figure which absolutely meets each particular case, but Mr. Edge, after personal investigation, and as the result of communicating with various tyre companies, gives as the most suitable pressure for tyres on "large cars" the following figures. Certain it is that if an adequate pressure is not maintained any tyre suffers from the excessive bending of the rubber and fabric (molecular action in the cover itself) which generates considerable heat, so that the walls of the tyre crack or even burst.

Proper pressures for tyres on large cars:—

Make.	Front wheel.	Back wheel.
Dunlop	... 70 lbs. sq. in.	... 85 to 90 lbs. sq. in.
Michelin	... 70 to 80 lbs. sq. in....	70 to 80 lbs. sq. in.
Continental	... 75 lbs. sq. in.	... 80 lbs. sq. in.
Palmer	... 75 to 80 lbs. sq. in....	95 to 100 lbs. sq. in.

The Lady, the Lease, and the Motor 'Bus.—One cannot help a smile at the expense of the indignant lady who, residing in the aristocratic purlieus of Portman Square, upon her return from a "health-giving holiday"

has written to the papers in a state of exasperation, that after paying £4,000 for the lease of her house, and £2,000 more in fitting it up, it is being rendered unpleasant for her by the fact that objectionable enterprising motor 'bus companies have, during her absence, started running motor 'buses past her door, up to even as late an hour as one o'clock in the morning. The lady is very indignant, not only with the 'buses, but with their customers—"night wanderers" she terms them—who, she observes, if they had any sense, would retire to rest much earlier. No doubt people who pay £4,000 for leases and £2,000 for fitting up their houses, can usually afford to retire to rest exactly when they please, but we trust we may point out, without incurring the suspicion of vulgarity, that there are many people in the city of London whose sad fate it is to be compelled to work till past midnight, and to them the late-running motor 'buses are proving a godsend. The attitude of the lady of Portman Square reminds us forcibly of Marie Antoinette, who, when it was explained to her that the "common people" were starving because they had not any bread, was very sympathetic, but enquired wherefore the unfortunates did not regale themselves with cake.

APROPOS of the various methods of road treatment to which we refer editorially this week, it is satisfactory to learn that the Cuckfield Rural District Council are making up two miles of their roads with tarred granite chippings.

CORRESPONDENCE.

* * The name and address of the writer (not necessarily for publication) MUST in all cases accompany letters intended for insertion, or containing queries.

MOTORS AND FIRE LOSSES.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—During the past few days a motor 'bus, costing about £1,000, was destroyed at Ham by the petrol catching fire, a motor car at Blackfriars set ablaze and was burnt to scrap, a motor garage at Aberdeen has been burnt down, fifteen cars being destroyed, at the F.I.A.T. garage at Long Acre cars have similarly been destroyed, and only a few months before that Long Acre itself was a volcano of fire through the inflammable materials of which motor cars and garages are built. If Mr. Yerkes finds it possible to build the bodies of the underground railway carriages of materials which cannot be set ablaze, I do not see why the directors responsible for motor omnibuses, &c., should not at least have as much regard as Mr. Yerkes. That an accident to the petrol or the electric working can make utterly worthless a thousand pounds worth of shareholders' property in a few minutes is a very serious matter for all having monetary interests in motor car and omnibus companies, and an obviously severe reflection on the foresight of those now directing these industries.

Yours faithfully,
ECONOMIST.

September 21.

RURAL DISTRICT COUNCILLORS, MOTORS, HOSPITALS AND LUNATICS.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—It is to-day reported in a daily contemporary of yours that a member of the Croydon Rural District Council, in the course of discussion, observed that "motorists were raging and tearing all over the place and filling the hospitals and lunatic asylums." This councillor's opinion does not, I suppose, deeply interest the public, but it usefully illustrates the recklessness with which charges are brought against motorists by persons who allow their prejudice to get the better of their reason.

I have this morning made enquiry as to the number of patients under treatment for accidents caused by motors at the following great hospitals—St. George's, Guy's, St. Mary's, St. Thomas's, and the West London.

The sum of the beds available at these noble institutions is 1,998. The number of patients suffering from accidents caused by motors is two, one per thousand beds, and yet an official, speaking officially, has the temerity to assert that motorists are "filling" the hospitals.

I have not yet had time to obtain statistics from the lunatic asylums in reference either to motor victims or district councillors.

I am, your obedient servant,

W. J. BOSWORTH (Colonel),
Chairman, Automobile Association.

September 22nd.

TOURIST TROPHY RACE.

To the Editor of THE AUTOMOTOR JOURNAL.

SIR,—It was, I believe, in the year 1901 that Mr. Claude Johnson asked me to put forward some suggestions, *re* a racing contest, whereby the speed of the cars would be kept within reasonable limits. I gave my opinion that in order to do this two things only were necessary, namely, to fix a limit on the fuel consumption, and secondly, to limit the cylinder capacity, or, rather, the piston displacement at, say, 1,000 revolutions per minute.

The question of weight limit should not, in my opinion, come into question. If a weight limit is specified, cars will be specially prepared for the event, and all kinds of make-shift appliances will be evolved in order to reduce weight. I take it that the Tourist Trophy event is primarily one to improve the touring cars, and if makers are faced with the weight limit, it naturally follows that modifications from standard models will be made, and the event simply becomes a speed contest, and is worthless as a real test of genuine touring cars.

It would be interesting to know if any car entered and run in the recent contest is exactly the same weight as similar powered cars supplied in the regular way of trade. Judging by the number of breakdowns, it is to be hoped that the cars were not the usual commercial ones, and that they were more or less racing machines.

Out of 42 starters only 18 cars completed the course, which is only 42 per cent. of the total number of starters. There is only one deduction to be made, and that is the cars were not suitable ones for the event, and there is no doubt that a very much larger proportion would have finished had there been no weight limit, or had the weight limit been a higher one.

It is evident, from the very valuable data which has been obtained by the recent contest, that more satisfactory regulations can be set out for future contests, and the value of making one of the rules a limitation of piston displacement should not be lost sight of. Looking at the results it will be found that the cars having motors with the greatest piston displacement are placed in the following positions:—

The cars with engines having the greatest piston displacement at 1,000 revolutions are placed first and fourth.

The car placed second is also second as regards piston displacement, while the third car and the tenth are the next highest in piston displacement.
